6116 And between themselves, doubtless, while the water is thus suffered to run, each lower proprietor as against those above him has a right to demand for himself the full, unobstructed enjoyment of the improved flow. But whatever the relation between the state and them or between themselves, these relations cannot rationally extend to effect one way or the other those above or below them.

The proposition of the counsel on the other side, then, is at last cut down to this:—that if A, in the process of transmitting the water of No. 2 from one side to the other of No. 1, compelled for a part of the way to use or does use a part of the channel of No. 1, which does not happen to belong to him as riparian proprietor, then and in that case, whatever his intentions the instant the water is poured into that portion of the channel; he can no longer pursue his exclusive claim to it and utterly loses his right to transmit it across for his own use on the other side. By force of some metaphysical principle of law, it becomes indissolubly annexed to No. 1, as a part of its "natural, customary and ordinary" flow, and B, and not only B, but C, D and E down to the very mouth of the stream, though contributing nothing to the expense of construction, repairs or operation, and though, not only not injured but in fact greatly benefited by its operation, as in this case, can come into a court of jus-
6117 tice, and, thanking A for nothing, claim the water he has been at so much trouble to secure, as their own.

On what principle of justice, intelligible to a judge, can such a claim be set up? In this age, courts, while strictly observing the mandates of positive law and adhering to established precedents, are not accustomed to favor technical notions tending to defeat manifest right; and the law of water courses, forms no exception in our jurisprudence.

This court, we think, will say to the appellant, what difference does it make to you, whether the land bordering on

(25)

the river, in Secs. 22, 23 and 27, in the Town of Lockport, and Sec. 3, in the Town of Joliet, belongs to the State or

to individual proprietors? If the state owned the land, or had express permission from the owners to thus use their portion of the bed and banks of the river as a convenient conduit to convey the water of its canal from one point to another, you hardly pretend that you would have any reason to complain. What better reason have you, if without any formal grant, these owners have now for more than thirty years acquiesced in such a use without objection and without asserting against the state any adverse rights for themselves, by reason of it; or, if so, certainly without asserting any which concern you or were for your benefit, or have any possible regard to your interests?

6118 The fact, then, that this link of communication between the hydraulic basin, at Lockport, and the upper basin, in Joliet, into which the river discharges as a feeder, does not belong to the state is, I submit, quite immaterial to the argument. It is a circumstance affecting only and exclusively the relations between these particular intermediate owners and the state. In fact, for fully two-thirds of the way, as will be seen, the river runs through canal lands, which must be supposed to have been sold subject to the right of the state to the use of the channel. But those also who purchased from the Government of the U. S. must have done so after the plan of the canal connecting with the Desplaines river as a feeder was adopted, and with full knowledge of and reference to it.

If ever there was a case of prescriptive right, here certainly we find a right by prescription in the state to employ this section of the river channel as a connecting link between the two canal levels, for the purpose of transmitting the surplus water from one to the other.

It is a case strongly reminding us of the language employed in a decision already quoted: "It would be a harsh rule to require those engaged in these enterprises to construct

(26)

an artificial ditch along the whole route through which the water was to be carried, and to refuse them the *economy that nature occasionally affords* in the shape of a dry ravine, gulch or canyon?"

6119 Without pursuing this head of the argument further, the counsel for appellees respectfully submits the following propositions as maintained:

1. That the appellant is only entitled as against the state to the natural and customary flow of the Desplaines river; and can only complain of a diversion in respect thereto.

2. That the surplus water derived from Lake Michigan, in 1871, is in no sense a part of this natural and customary flow, unless that character is impressed upon it by the circumstances that between the hydraulic basin at Lockport and the upper basin at Joliet, it is conveyed in the channel of the river, running by the side of the canal, and employed as a convenient conduit provided by nature, and presumably with the consent of the riparian owners.

3. That this accidental circumstance does not change the rights of the state in the water as the proper surplus water of the canal, because there was no *intention* to abandon its use, in the sense of any of the adjudged cases cited to support that position; but, on the contrary, a manifest intention to resume it for further canal use.

4. That the peculiar occasion on which the City of Chicago undertook to finish the canal according to its original plan, in no way affects the rights of the state in the ownership and control of the surplus water fur-
6120 nished by the deep cut.

5. That the general policy of canal administration, as well as the canal laws of Illinois, contemplate and require the leasing of water power, wherever it can be profitably developed as a source of revenue, whether with or without accompanying

(27)

water lots. Hence, we contend there has been no diversion from the plaintiff by the state.

6121

II.

THERE IS NO RIGHT OF ACTION AGAINST THE APPELLEES.

This branch of defense, although inferior in public interest to the proceeding, is met in the record and cannot be passed over without notice.

The suit evidently is an attempt to escape the constitutional provision which prohibits the suing of the state, and also the statute which extends the same exemption to the Canal Commissioners.

R. St. Ch. 19, §3.

It has thus been declared the public policy of Illinois, that in controversies of this sort, between the state and individuals, if wrong has been done under the authority of the state, resort shall be had to the Legislature for relief. The appellant deemed this remedy rather unpromising and so has sued the lessees of the state, Slater & Druly. We think the action must fail for two reasons—one that the act of diversion was not committed by the appellees, and the other, that it is against public policy.

1. There has been no diversion by the appellees. The case shows that none was possible.

Abst., p. 1, Rec., 3.

The oat mill of the defendants is situated on the berm bank of the canal, about three-fourths of a mile below Dam No. 2; at which dam the water, that is not suffered
6122 to flow into the channel of the river and thence down to appellant's mills, is discharged into the Channahon level through the lock and a

(28)

bulkhead, constructed for the purpose.

At this point the canal has entirely completed its crossing of the Desplaines river and from thence onward diverges into a separate and independent channel.

The instant the water leaves the pool of the dam and descends into the Channahon level it becomes forever detached from all relations of riparian rights with the river and the mill and dam of the plaintiff.

When it reaches a point opposite the defendant's mill, it can no more be identified or recognized as river water than at a point ten miles below or at Ottawa or La Salle. It is *pure* canal water, in a legal, though, it must be confessed, in no other sense.

The act of *diversion*, therefore, as an actionable injury, takes place and is consummated at Dam No. 2; for the act must consist in that operation by which the water, instead of being suffered to flow over the dam into the river channel and down to Adam's wheels, is irrevocably turned off in another direction.

In this operation, conducted as it must be by the functionaries of the state, in the official administration of the affairs of the canal, the defendants, of course, have and can have no responsible agency. The stage of water
6123 in the Channahon level from time to time, and the

methods of supplying it, are matters of exclusive official regulation.

The water being by this process already diverted, Adam, as a riparian proprietor, has no further concern with it. In its mere character as a physical substance he sets up no right to it in this suit; and he can assert no *usufructuary* right, except where it is found existing under such local relations to his mill, that *he* himself, could use it as motive power, if the appellees did not. But it is obvious that when the water has

(29)

reached down to a point opposite their mill, it can be of no *benefit* to him in any possible event, and *e converso*, it can be no *injury* to him, if it is used by others. If, then, their use of it is no legal *injury* to him, how can it be denominated a diversion?

It seems too plan for serious dispute that the act of diversion, if any, is performed at the point where the road forks, so to speak, and is effected by the sole agency of the officers of the state, in the performance of their public duties.

If the place of the defendant's headgate, relatively to the plaintiff's mill was such, that, if not used by them, the water could be conceived as in some way available to *him*, the case would be very different. But such is not their relative position, as the agreed case and accompanying map clearly demonstrate.

6124 The appellant's only interest in the water, I repeat, is that of *user* for hydraulic purposes at his mill, and so the declaration expressly describes it. He asserts no right to it otherwise; and this usufructuary interest is only supposable under conditions which make it possible for *him* to use it. After it has passed down and out from these conditions, and is found in some place entirely beyond their range, it is altogether disconnected from the system of riparian rights pertaining to the Desplaines river.

2. The action was brought in evasion of our express and established public policy, in respect to controversies with the state, arising from the management of the canal by her official agents.

R. St., cited *supra*.

It is very distinctly a case coming within the reason

and spirit of this wise policy of the Government. Confessedly, it is

(30)

a dispute between William Adam and the State of Illinois, involving the control, at Joliet, of the immense volume of surplus water which pours down from Lake Michigan through the deep cut. If Adam has been aggrieved, the state should pay the damage; and this constitutional and statutory provision, while thus taking the rights and liabilities of the State out of the jurisdiction of her judicial tribunals, contemplate that her Legislature will do him ample justice. To that resort, however inconvenient, he is confined.

6125 If the Canal Commissioners, who made the lease to the appellees, as the official agents and representatives of the state, cannot be sued, would the court tolerate a suit against the executive officers in charge of the canal, say the superintendent or the locktender, for faithfully carrying out the orders of the Board? If the principal officer is protected, in the disposition of the surplus water from litigation, will not his subordinates and employes also be protected? There can be no doubt of it, since otherwise the whole object of this public policy of the state would be practically defeated.

In analogous questions arising from the acts of ministerial officers in executing process, the rule is universal, that what is a justification of the principal officer will also justify his deputies and assistants.

2 Hilliard on Torts, p. 156.

The same principle of immunity extends to all officers acting for the state.

Gidley v. *Pulmerston,* 7 E. C. L., 438.

Hodgson v. *Dexter,* 1 Cranch., 345.

The consequence is, that, inasmuch as the diversion of the water by the officers of the state is by express statute declared

(31)

to be not an actionable injury as to the state or her officers who may commit it, the lessees from the state, who, if sued at all, must be sued in the character of joint tort feasors with the commissioners, must and should share
6126 the like immunity. If the supposed cause of action is not a tort, but a claim against the state to be adjusted by

the General Assembly, then Slater & Druly, it would seem, cannot be joint tort feasors.

III.

THE PLFF'S CLAIM BARRED BY THE HAVENS' RELEASE.

A certain release from Adam's grantors, Haven & Haven, was put in evidence on the trial (Abst., 6), though not very strenuously pressed in defense, which, it was hoped, was invincible on other grounds. Nor is it now pressed strenuously; for, if either of the two preceding propositions shall receive the assent of the court, the point of the release becomes one of little or no practical importance. A few words, therefore, upon it, will suffice.

In the plan of the canal, the Desplaines river had been taken as a feeder at a point above the Havens' mill. In 1848, by an appropriate legal proceeding, the Havens claimed damages for diversion.

Canal Trustees v. *Haven*, 5 Gil., 548.

After considerable litigation, the case was finally compromised, and the release in question executed for a consideration of $3,060.

On the trial of this cause in the court below, it was urged against the release, when interposed as a bar to the suit by Adam, a grantee from the releasors, that it only gave to the Canal Trustees and the state the right to

(32)

use the water of the river strictly for the purposes of *navigation*, as contradistinguished from water power.

6127 But is it certain that this restricted construction is the true one? The intention of the parties is to be gathered from the whole instrument, the surrounding circumstances, and the nature of the subject matter.

By these lights is it not more fair to suppose, that the real, substantial design was to release to the trustees the rights of the Havens in the entire flow of the stream for *general* canal purposes? True, that in one place the expression "for the purpose of navigation" is employed. But immediately following we find these other words—"in the same manner the water in said river in connection *with other feeders* is now used for supplying said

canal." Was it not the leading idea, that it was to be turned over to the trustees to be used as a feeder, just like any other *feeder* supplying the canal?

The principal purpose of every canal, no doubt is navigation; and water power is only an incident. Hence, in an instrument of grant or release, the principal object might and naturally would be named, without, however, necessarily raising the presumption that it was meant to exclude that which was usually connected with it as an incident. If in this case the Desplaines in 1853 had a capacity to fully supply the wants of navigation, and a surplus besides, perhaps a doubt might arise whether the grantors did not intend to restrict their grant to the quantity required for the specific object of navigation. But in truth the Desplaines *per se* was and is a most in-
6128 significant stream, a mere rill in the summer season. There was no time when the state could not for navigation purpose command the whole volume of its discharge. Nor was the state under any obligation to maintain any other particular feeder, either the Calumet or the pumps. Its discretionary power to construct and alter its own works

(33)

could not have been intended to be tied up in that way. The instrument cannot be construed as importing a binding condition, that the state should continue forever the particular system of supply then happening to exist, if it should be found expedient afterwards to change it for the public interest.

And, if such was the true construction, it would not much help the appellant. It certainly was an incidental object of "the other feeders" to which this feeder was assimilated, to furnish water for hydraulic purposes as well as for navigation purposes.

If, then, the Desplaines was placed on the same footing with the other feeders and made to subserve the same general objects, how can the construction suggested be upheld?

In conclusion of the whole case, it is now respectfully submitted to the court that the following propositions have been maintained on the part of the appellees:

First. That the Canal Commissioners have not been guilty of diverting any water, to which the appellant was

entitled as a lower riparian owner on the banks of the
6129 Desplaines river.

Second. That there has at all events been no diversion by the appellees, justifying an action against them.

Third. That if there has been a diversion from the customary and natural flow of the Desplaines river, such case was authorized by the Havens' release.

G. D. A. PARKS,
Atty. for Appellees.

(1)

6131 IN THE SUPREME COURT OF ILLINOIS,

NORTHERN GRAND DIVISION,

September Term, A. D. 1881.

Wm. M. Druley,
Appellant,
vs.
William Adam,
Appellee.
} Appeal from the Appellate Court of the Second District.

BRIEF AND ARGUMENT FOR APPELLANT.

SYNOPSIS OF THE CASE.

This was an action in the common form brought in the Will Circuit Court by Adam, the appellee, against Druley, the appellant, and one Slater for a diversion of the water of the Desplaines river from the plaintiff's mill. Judgment having been rendered for the defendants, by the Circuit Court, to which the cause had been submitted for trial, without a jury, an appeal was taken to the Appellate Court; and, as the substantial facts were not disputed, they were embodied by stipulation of counsel in an agreed case. By this it will appear, that the main defense set up was two-fold, 1st, that there had been no diversion of the proper waters of the Desplaines river to which the riparian rights of the plaintiff related; 2d, that if there had been such diversion, yet, the act effecting it was not in any natural

(2)

or legal sense the act of the defendants; but was exclu-

sively the act of their lessor, the State of Illinois, done by her official agents, in the regular and authoritative administration of the business of the canal.

The Appellate Court having reversed the judgment of the court below, and rendered a judgment for damages against the defendants, the case has been brought here upon a certificate of the judges in due form, setting forth specifically the questions of law involved, and declaring, that they are of such importance, as that they should be passed upon by this tribunal of last resort.

The principal facts of the case are these:—The Illinois and Michigan Canal crosses the Desplaines river at Joliet. This crossing is effected, as the map attached to the record indicates, by passing the unappropriated waters of the river, mingled with those of the canal through two basins, for a distance of about a mile, and at last discharging them again into the natural channel, over the lower dam, designated as Dam No. 2. Adam's mill is situated on the east bank of the river, about a third of a mile below this dam.

When the canal leaves the river at Dam No. 2, it pursues a southwesterly direction, diverging gradually more and more from the river, this being known as the Channahon level. On this level, and about half a mile *below*
6133 Adam's mill dam, the defendants in 1878 erected an oat mill on the berm or westerly bank. The Canal Commissioners had discovered, that by simple and not very expensive structures, a valuable water power, promising to yield a considerable addition to the revenues of the canal, might be developed in this quarter of the town of Joliet; and accordingly made to Slater & Druly a ten years' lease of sufficient water to run their mill, under which leave the defendants proceeded to put their enterprise into operation. Their establishment is situated nearly a mile below Dam No. 2, where the river and canal part company. It is

(3)

for this water, thus drawn from the canal, at a point far below the plaintiff's mill, and far below Dam No. 2, that the action was brought against them as lessees of the state; Adam not choosing to make his contest directly with the state herself.

It has never been, and of course cannot be pretended that the surplus water in question is to be described as

any part of the natural and customary flow of the Desplaines river; if by that expression is meant the flow derived from its natural source and affluents in the watershed which it drains. The Desplaines is in truth a very insignificant stream, never of much use as a feeder in the season when its services are most needed, and, except as reinforced by contributions from the canal, affording sites only, for what are sometimes denominated
6134 "thunder shower mills."

In 1871, when the summit level from Chicago to Lockport was finished on the original Deep Cut plan, which the pecuniary embarrassments of the state had for so many years suspended, drawing its supply directly from Lake Michigan, as the fountain head, the Canal Commissioners found themselves in possession on the summit level of a vast surplus of water, tenfold beyond what was required for navigation. The question then met them, how they could best utilize it for the canal revenues and the public good?

From Lockport to Joliet there is a fall of about fifty feet, divided into five levels. If, as we must for the present venture to assume, although questioned by the Appellate Court, this surplus water rightfully belonged to the canal and was subject to the control of its officers for all legitimate canal purposes, it was manifestly the duty of the Commissioners to make the most profitable disposition of it, possible under the circumstances. If susceptible of repeated use, it seemed to be as manifestly their duty to avail themselves to the utmost of this accidental advantage. How was this to be done? How were they to preserve for repeated use at successive falls the pro-

(4)

prietary rights of the state in the water? It could not, at least but a small portion of it could be conveyed through the channel of the canal itself from Lockport to Joliet. To excavate or construct another channel by its side as a
6135 sort of race or conduit for that sole purpose would be absurd. Nature, however, it was seen, had provided a convenient medium in the channel of the Desplaines river just alongside; and by this, the surplus passing through the spillways and mills at Lockport, could be, as it always had been, transmitted, till it again reached the canal, in what is called the "upper basin" above Dam

No. 1. No question has ever been made in regard to the local rights pertaining to this body of water, as between the state and any other interests concerned in it, till we come to Dam No. 2. Here the battle begins. At this point the Canal Commissioners assert the right of the state to pass this immense volume of water received into the summit level from the lake, or so much of it as they find profitable to their revenues, into the level below, instead of allowing it to flow over the dam into the channel of the river, for the plaintiff's benefit.

The main issue thus becomes apparent to the court. Does this surplus water belong to the State of Illinois or to the appellee? Is it in any sense to be recognized under the circumstances of the case, as a part of the *customary* flow of the Desplaines river?

Treating the state and Adam as occupying substantially the mutual relation of upper and lower riparian owners on the river, is the state, as the upper owner, entitled to take out again what it has brought in, from
6136 Lake Michigan by this recent improvement? By using the Desplaines as a conduit for a part of the way, has the state, in relation to this lower riparian owner, irretrievably lost its proprietary rights in this volume of water, thus conveyed to Lockport through its own works from its own reservoir? Viewing the canal from Chicago to Joliet as one connected system of structures de-

(5)

signed for the conveyance and disposition of the water derived from the lake, and considering it as a necessary consequence of that plan, that the water discharged at Lockport should be again restored to the canal in the upper basin, can the official agents of the state by the fact of employing this convenience of transmission from one level to another, be supposed to have *abandoned* this valuable surplus, with respect to any proposed future exclusive use of it? If it be conceded, as it must, that there was no real *intention* on the part of the canal officers to relinquish the proprietary rights of the state in the future disposition of the water, does such a result follow, nevertheless, from the circumstance, that for a part of the way, the state, instead of having drawn the water continuously through the canal or through some other channel, of which she is sole proprietor, has seen fit to avail herself of an obvious "economy of nature," as a

California judge expresses it; and suffered it to flow for
6137 a short distance through the channel of the river?

These are the questions of greatest interest in the case; yet there are others embraced in the certificate of the Appellate Court which will demand attention.

It was argued in both the Circuit and Appellate Courts, on behalf of the defendants, and will be again insisted on here, that after the water had passed down into the Channahon level, and was found under such local conditions in relation to the plaintiff's dam, that *he* could by no possibility use it to propel his machinery, it was as much detached from the system of riparian rights appertaining to the Desplaines river, as if it had reached the very *terminus* of the Channahon level, ten miles below, or Morris or Ottawa. This being so, the act of the defendants in making use of water found opposite their headgates, which had already flowed down below the plaintiff's dam, and thus found there by no responsible agency of theirs, could be no actionable diversion on their part; and the cause of complaint if

(6)

any, was exclusively against the state or the Canal Commissioners.

There are still other points, to which the opinion of the Appellate Court has challenged the earnest attention of counsel; but which are not deemed necessary to now introduce to the notice of this court in this short preliminary view.

6138 BRIEF.

I.

NO DIVERSION BY THE STATE.

No diversion can be charged against the state; because, the surplus water in question is to be regarded as the proper water of the Illinois and Michigan Canal, and in no sense a part of the water "*accustomed*" to flow in the Desplaines river, on which the appellee, William Adam, is a riparian proprietor.

1st. A lower riparian owner, on a natural water course, is entitled and only entitled to receive, from the proprietor above the PROPER, NATURAL AND CUSTOMARY flow

of the stream, unimpaired in quantity and in the conditions of fall necessary to make it reasonably useful to him.

Ang. on Water Courses, Sec. 95, *et seq.*

Plumleigh v. *Dawson*, 1 Gil., 544.

Evans v. *Merriweather*, 3 Scam., 492.

This doctrine is expressed in the maxim of the civil law, "*aqua currit et debet currere, ut currere solebat.*"

Belknap v. *Belknap*, 2 Johns. Ch., 463.

6139 2d. The proper, natural and customary flow of water in a natural water course must be defined in general terms, as that

(7)

body of water which issues from its natural sources and affluents, in the watershed that it drains.

Ang. W. C., Sec. 4, *et seq.*

3d. If an upper proprietor A, increases the volume of water by artificial means, from a reservoir of his own, as in the case at bar, and permits it to pass unreclaimed, below his own limits, then, as between the lower proprietors B & C, C may justly insist, that he is entitled to the benefit of the increased flow, and that B ought not to divert it from him.

Ang. W. C., Sec. 95.

4th. A riparian proprietor, owning on both sides of the stream, is to be deemed the perfect and absolute owner of its bed, banks and channel, subject only to the right (familiarly if not with strict propriety termed an *easement*), in favor of his neighbors below; that although he may make use of the water *ad libitum* and even alter wholly the course, dimensions and character of the channel within his own limits, he shall at last deliver to the servient proprietor unimpaired the natural flow which he had received from those above him. This is stating the rule in somewhat stronger terms than is strictly correct, but still with sufficient accuracy for our present purpose.

6140 Ang. W. C., Sec. 5.

Buckingham v. *Smith*, 10 Ohio, 288.

Trustees, &c., v. *Dickinson*, 9 Cush., 547.

Brace v. *Yale*, 10 Allen, 443.

2 Bouvier's Institutes, 174.

5th. The rights of the power proprietor, B, being thus confined to the customary, proper and natural flow of the

stream, derived from its head springs and affluents, he has no legal concern, not the least, in the use which A may choose to make of his own section of the channel. This proposition can hardly be stated too broadly. And on the same principle it

(8)

also follows, where the case is not affected by prescription, contract, or other special conditions, that if A, for his own private purposes, conducts water into the stream from an exterior source, to which B is a stranger, he, (A), may again deduct an equivalent quantity, provided in doing so he does not interfere with the rights of B; and provided also, he has done nothing, and suffered nothing to take place, amounting to an *effectual* abandonment to public use.

Whittier v. *Cacheco Mfg. Co.*, 9 N. H., 454.
Soc'y for Mf'g. v. *Morris Canal Co.*, Saxton (N. J.), 157.
Butte v. *Vaughn*, 11 Cal., 143.
Burnett v. *Whitesides*, 15 Cal., 35.
6141 *Elliott* v. *Fitchburg R. R. Co.*, 10 Cush., 191.
Embury v. *Owen*, 6 Exch., 360.
2d Washburne on Real Property, 329.
Hoffman et al. v. *Stone et al.*, 7 Cal., 46.

6th. The water discharged at Lockport from the tail-race of Norton's Mills, and the spill way, is in no legal sense *abandoned*, nor the right of the state to its future use relinquished, by reason of the fact, that it happens to pass from one level to another through a medium exterior to the prism of the canal, instead of directly between its walls, or through some other channel exclusively owned by the state. It is sufficient, that it in fact *does* rejoin the canal and *does* return to a condition of *statu quo*, long before reaching the dividing line between the state and Adam; and it is of no practical or legal concern to *him*, what may have been the particular mode or conditions of transmission at some remote stage in its passage.

Hoffman et al. v. *Stone et al.*, 7 Cal., 46.
Butte v. *Vaughn*, 11 Cal., 143.

7th. The water supplied to the summit level through the

(9)

deep cut belongs to the canal, and is within the jurisdic-

tion of the commissioners, in the same sense and to the same extent, precisely, as the water found in any other of the several levels. The motive causes and history of the improvement are quite immaterial here.

6142 Its supposed benefit to the drainage of Chicago, as an incidental consequence of its flow into and through the canal, cannot affect its ultimate *status* as *pure* canal water, pure at least in a legal sense.

Pub. Laws, 1865, 83.

8th. It is the duty of the commissioners, as well with a view to revenue for the support of the canal, as to incidentally promote the manufacturing interests of the country traversed, to develop, husband and utilize water power to the utmost, wherever they can do so. The statute indeed expressly recognizes and enjoins this duty.

R. S., Ch. 19, Sec. 8, Clause 6.

II.

NO DIVERSION IMPUTABLE TO THE DEFENDANTS AS LESSEES FROM THE STATE.

If, however, a diversion could be charged against the state by this act of turning off the water in question through the bulkhead in Dam No. 2 into the Channahon level, it thereafter becomes finally separated from all connection with the Desplaines river, and from the entire system of riparian rights and duties appertaining thereto. Being thus for future purposes, indistinguishably incorporated with the proper water of the canal, and having passed under such local relations with reference to the appellee's mill, that *he* could by no possibility

6143 use it, to turn his own wheels, its use by Slater & Druly can

(10)

not be described as a diverting—by them—from him—of the waters of the Desplaines river.

Parker v. *Griswold*, 17 Conn., 288.

The claim, if any there be, as against the State of Illinois, for an injury done to a private citizen by its official agents, and to be redressed, as the constitution and the laws direct, by the justice of the Legislature; since no

suit is permitted to be brought against the state or the Canal Commissioners.

Const., Art. IV, Sec. 26.

R. St., Ch. 19, Sec. 3.

If the alleged injury is not an actionable tort against the state or commissioners, from considerations of public policy, but left to legislative remedies alone, it ought not to be chargeable in law against the defendants as joint tort feasors with the canal officers; and the present suit, as being in palpable evasion of the spirit of the statute and constitution, ought not to be sustained.

Jermaine v. *Wagner,* 1 Hill (N. Y.), 284.

Hilliard on Torts, Vol. 2, 155-255.

Main v. *McCarty,* 15 Ill., 441.

6144

III.

THE HAVENS RELEASE.

1st. The appellee, Adam, bought subject to the perpetual release of damages executed by Philo A. and Orlando H. Haven to the canal trustees in 1853. This release was intended to confer upon the trustees a plenary and unlimited control over the Desplaines as a feeder, to the same extent as could be supposed of any other of its feeders; the releasors

(11)

making their riparian rights entirely subordinate to the public demands.

Ang. W. C., Sec. 228.

This broad view of its import and intention is rendered probable by the consideration that even on this basis the compromise was one highly advantageous to the Havens; inasmuch as this court had recently decided, that their mill privilege was really of no value save as a sort of dog in the manger, to annoy the trustees with mere technical causes of action and barren claims for nominal damages. We specially invite the attention of the court to

Canal Trustees v. *Haven,* 11 Ill., 554.

2d. But whether the release was or was not a complete bar to the action as suggested, the acceptance of the release by the trustees can upon no principle of construction be held as any recognition of the right of the Havens to claim recompense for that portion of the water

6145 which had been furnished by the trustees themselves, in the surplus discharge at Lockport.

So shocking an inference is forbidden by every rule:

"a"—Grants are to be construed most strongly against the grantor. Ang. W. C., Sec. 149 "f." *Alton* v. *Trans. Co.*, 12 Ill., 38.

"b"—But when even express grants are made by the state, the rule is reversed, and they are to be construed most favorably for the government. *People* v. *Brown*, 67 Ill., 438.

"c"—The release nowhere speaks of any water, but such as strictly pertained to the Desplaines river, as a part of its proper, natural, original and customary flow. Rec.,

(12)

p. 26.

"d"—In the legal proceedings of which the release purported to be a final adjustment, it does not appear, from the reports, that there had ever been any pretense of a legal claim by the Havens to a drop of this surplus water, as entering into their estimate of damages against the trustees. So impudent and preposterous a claim was not thought of.

3d. The release, at all events, is to be construed with reference only to the facts and circumstances surround-
6146 ing the parties *at the time*. *Wilcox* v. *McGhee*, 11 Ill., 381; *Hadden* v. *Shoutz*, 15 Ill., 582.

The Deep Cut, which, by a remarkable and unlooked for train of causes, was accomplished eighteen years afterwards, pouring 25,000 cubic feet of water per minute into the canal, was not then in the remotest contemplation of anybody. Even if it be supposed, that in 1853, in this settlement with the Havens, the canal trustees, to buy their peace, chose to ignore the distinction of right between the natural flow of the Desplaines river, and that much larger flow which they themselves at that time added at Lockport, still it is impossible to believe that by paying three thousand dollars for a grant of the river as a feeder *to* the canal, they intended at the same time to *make* a perpetual grant of the canal as a feeder *to* their

(13)

river.

ARGUMENT.

The certificate from the Appellate Court will be found to indicate substantially the following as the principal points for consideration, stating them in a condensed form:

First. Viewing the State of Illinois and Adam, as standing in the relation of upper and lower riparian proprietors on the Desplaines river, is the state guilty of a *diversion,* if it takes out above Adam's dam a portion of the water which it brings in from Lake Michigan?

Second. Even if we suppose the state to be guilty of
6147 a diversion, by passing the water from the pool above Dam No. 2 down into the Channahon level on which the oat mill of the appellant is built, and where the water can by no possibility again become available to the appellee, can Slater & Druly be regarded as the responsible agents in this act of diversion, thus already consummated, by an operation of public authority at the lock and

Third. Adam having purchased subject to the release executed by his grantors in 1853, does that release operate to bar the action?

Or, on the other hand, does the mere acceptance of it by the canal trustee now bar the state from asserting as against the appellee an exclusive right to dispose of this *additional* volume of water obtained through the Deep Cut?

The first is the principal question, and to that we devote our chief attention; the interest of both parties and the public being to test the validity of the absolute right which the Canal Commissioners have deemed it their duty to assert, to lease the surplus water at Joliet, supplied by the recent improvement, in such modes as they find most productive of revenue and most

(14)

conducive to the public good. Was the Deep Cut, in other words, made for the benefit of William Adam or the State of Illinois? Is the water it supplies a monop-
6148 oly to be enjoyed by the owner of Lot 1, Block 57, School Section, Joliet, or may its benefits be distributed to other localities in the town?

I.

THE CASE SHOWS NO DIVERSION BY THE STATE.

The main topographical features of the case are shown on the map accompanying the record, and we shall assume the court to be sufficiently advised of the relative localities involved. The facts also that are deemed essential to present the points, on which the decision of the court is sought, are drawn within a narrow compass by the agreed case. Nothing is left, but a question of law. If this water, which is the subject of the alleged diversion, is conveyed into the canal from Lake Michigan, through the works and at the expense of the state, and constitutes no part of the customary flow of the Desplaines river, can it be rightly drawn out again by the state, if done on her own premises; and if in doing so the natural flow of the river to Adam's Dam is not diminished but largely increased?

Perhaps the theory on which the appellant relies may be best illustrated by casting the prominent facts into the form of a hypothetical case.

Let A (the state) and B (Adam) be upper and lower riparian proprietors on a given natural water course (the Desplaines river), which we will designate as water
6149 course No. 1.

A, the upper proprietor, happens to control another and entirely independent reservoir, designated as No. 2 (Lake Michigan), the waters of which, for certain purposes of his own, he

(15)

desires to transmit across the channel of No. 1, by some suitable structures, the particular method being a mere question of judicious and economical engineering, governed by the local conditions of the case.

The plan which A in fact adopts is this: Instead of crossing *directly* at the point, where No. 1 is introduced into No. 2, by an aqueduct or by subterranean pipes, as we will suppose he might, he finds it expedient to cross at a point on his premises somewhat lower down, employing the channel of No. 1, as a temporary conduit for conveying the water of No. 2, to its destined point of exit, and there, by proper structures discharging this extra water into some channel of his own on the other side, which he has prepared for it.

By this process, the waters of the two streams are necessarily mingled together, while thus flowing in the joint or common channel, and are, of course, incapable of identification. But in the case supposed, the water is treated simply in its character as an agent for producing mechanical power, and the rights of the parties obviously admit of perfect adjustment on the basis of *equivalent quantities.* One cubic foot of water is as good as an-
6150 other cubic foot of water upon a water wheel; and the element of identity therefore is to be dismissed from the argument, as of no essential value.

Question. By thus withdrawing from No. 1 the water which he has temporarily added to it, is *A guilty of a diversion?*

A plain statement of the question comes little short of answering it. We certainly but express what at first blush seems a self-evident proposition, when we say, that A must possess a perfect right, as against B, to deduct from water course No. 1, by artificial channels the same amount of water which he has added to it by artificial channels; unless that right has been qualified by contract or prescription.

This proposition, we submit, is an inevitable inference from

(16)

the elementary principles governing the relations between riparian owners.

First. Subject only to the reciprocal rights in the flow of the water existing between the dominant and servient estates, each riparian proprietor is the owner of the bed and banks forming the channel of a water course as absolutely to all intents and purposes, as he owns his farm upon its borders; and he may use it with precisely the same perfect and unqualified rights of dominion.
6151 No one can call him to account for such use, save only in respect to the water which flows upon, through and from his land. This doctrine is too familiar to need the support of authorities.

Second. The law of riparian rights to which A, the upper owner, is subject, simply demands that he shall transmit to B, the *natural, proper and customary flow* of the stream, as he receives it from his neighbor above. And to that extent only is B at all concerned in A's part of the channel.

The general principles also, we presume, will not be disputed, and we only refer as a good, short statement of them to Broom's Maxims, 374.

It follows, of course, that B has no possible concern with the question how A chooses to use that portion of the channel which is within his own domain, any more than with the question how he might choose to subdivide, enclose or cultivate his fields. He, at all events, sustains no real, and as we humbly suppose, no *technical* injury, if A withdraws by a train of suitable structures what he has thus introduced from an exterior source.

It seems, indeed, too plain for argument, that no right of B is impaired, unless the dogma (for so we must call it), can be supported, that the instant a drop of water
6152 is added to the volume of No. 1, it becomes an inseparable constituent part of it, with relation to the rights of B; no matter at what place, in what manner, by what party, or for what purpose the addition

(17)

was made. The notion, surely, has no foundation in natural and rational justice; and, is warranted, as we believe, by no well considered authority.

In such a case, A's *intention* will be found a controlling and decisive consideration. If indeed he *intends* his contribution to No. 1, as a *permanent* addition to its flow, and not, with a view to resume it for some ulterior use of his own, then perhaps there are two or three decisions squinting towards the rule, that even *he* cannot divert it afterwards, though on his own land.

Eddy v. *Simpson*, 3 Cal., 249.

Webb v. *Portland Mfg. Co.*, 3 Sumner, 189.

Tourtelotte v. *Phelps*, 4 Gray, 370.

So if A adds extra water to No. 1, which he suffers to flow down in the channel and *abandons* to the public, in that case, as between B and those below *him*, say C and D, these still lower proprietors, might as against B, rightfully claim, that he should not divert it, from them. It cannot be doubted that it is in this sense, Angel says:

"It is also important to observe, that as each proprietor through whose land a water course passes has a right to the flow and descent of the water course, sub-
6153 ject to a like reasonable use by all others, *he necessar-*

ily enjoys the benefits of any improvements made by the proprietors above him."

Ang. Wat. Courses, Sec. 95.

We believe, however, there are no well considered decisions which hold, that when A employs that part of the No. 1, belonging to him, simply as a convenient medium for transmitting the waters of No. 2 across into a channel which he has provided for his own purposes on the opposite side, B, as against A, acquires any legal right whatever in such extra water. There is not the slightest resemblance between the relations of A and B, and B and C in such a case.

(18)

In support of our proposition we refer to

Whittier v. *Casheco Mfg. Co.,* 9 N. H., 454.
Soc'y for Mfg. v. *Morris Canal Co.,* Saxton, 157.
Butte v. *Vaughn,* 11 Cal., 143.
Burnett v. *Whitesides,* 15 Cal., 35.
Elliott v. *Fitchburg R. R. Co.,* 10 Cush., 191.
Embury v. *Owen,* 6 Exch., 360.
2d Washburne on Real Property, 329.
Hoffman et al. v. *Stone et al.,* 7 Cal., 46.

The leading authority supposed to hold the contrary is *Eddy* v. *Simpson,* 3 Cal., 249; the only case cited in that view by Washburne in the edition of his work on Easements, to which the writer has had access. If to be so construed, we shall soon see that it has been completely
6154 overruled by later decisions of the same court.

In the case of *Hoffman* v. *Stone, supra,* the water course, answering to No. 1 in our hypothesis, was named Dutch Gulch. It was dry at certain seasons of the year, but, nevertheless, was by the court treated as a natural water course, on which plaintiffs and defendants held the relation of upper and lower riparian proprietors.

Ang. Water Courses, Sec. 4.

The defendants, it appears, owned a chain or system of artificial ditches for the supply of which it was convenient to use channel of Dutch Gulch as a connecting link. Under this plan, they took out in the end, the water they put in, so that it did not reach the plaintiffs. The plaintiffs alleged this to be a *diversion;* and sought relief by injunction, claiming the rights of prior locators, and the exclusive control of the channel. The court, however held, in substance:

1st. That defendants (A) might use the channel of No. 1, to pass the waters of No. 2 from one point to another.

(19)

2. That the defendants (A) did not *abandon* the water to the use of No. 1; as it was evident that they put it in with the express purpose of taking it out again.

3. That while the physical conditions under which the rights of riparian owners in California existed were peculiar, yet they were regulated by no local statutes, and
6155 were entirely governed by the rules and analogies of the common law.

This decision, as the court will see, proceeds upon the theory of natural and rational justice which we have assumed, viz., that B in any case is only entitled to the *natural* and *customary* flow of No. 1; that A may use the channel for his own convenience in any way he sees fit; and may, in entire consistency with the rights of B, again draw out the water which by artificial means he has put in for his own purposes, by his own structures, and at his own expense. In California, it would seem, that priority of location on government lands is held to give to the riparian proprietor some superior right in the channel and water of water courses. Such priority, if we mistake not, was enjoyed by the plaintiffs in all the California cases we have cited. But this, it is obvious, only serves to strengthen the force of the decisions as authorities in our favor.

The case of *The Butte Canal and Ditch Co.* v. *Vaughn, supra,* was an appeal to the Supreme Court of California, and was an action brought by the plaintiffs for the diversion of the waters of the south fork of Jackson Creek in the County of Amador. Defendant in his answer set up a right to a portion of the water, by virtue of a contract with the owners of the Amador County
6156 Canal, which drained the north fork of the Mokelumme river. From this canal the water claimed by defendant was emptied into a natural ravine, and from thence flowed into the south fork of Jackson Creek, above the dam of plaintiff, and after descending the stream for a mile, was again

(20)

taken up at a point above plaintiff's dam, and diverted through defendant's ditch to his mining ground.

The opinion of the court was delivered by Mr. Justice FIELD, who after reciting the above facts proceeded as follows:

"Upon these facts the single question is presented whether the defendants, after the mingling of the water conducted by them from the canal with the waters naturally flowing in the fork, possess the right to take out an equal or less quantity from the stream, or is the right of the defendants to the use of the water, whilst in the ravine, or to the use of an equal quantity, lost by its subsequent mingling with the natural waters of the fork?

The case is similar in its material features to that of *Hoffman et al.* v. *Stone et al.*, 7 Cal., 45, where this court per MURRAY, C. J., said:

The plaintiffs, being the prior locators, it would follow that any interference with the waters of Dutch Gulch would be an infraction of their rights. But the appropriation of the waters did not give them the exclusive use of the bed of the stream. We see no reason why it might not be used by others as a channel for
6157 conducting water, so long as it did not interfere with their rights. If the defendants were diverting the *natural* water of the stream as well as that brought into it by themselves, then the plaintiff would have a just cause of complaint."

Justice Field then proceeds:

"In the case at bar the channel of the south fork of Jackson Creek is used as a connecting link between the Amador County Canal and the ditch of the defendants.

* * * * *

The point settled in the case of *Hoffman* v. *Stone* is this: That the prior right to the use of the natural water of a stream does not entitle the owner of such right to the exclusive use of the *channel. So long as his right is not interfered*

(21)

with, there is no reason why the bed of the stream may not be used by others as a channel for conducting water. If the plaintiffs in the present case receive their full supply, as previous to the introduction of water by the defendants, they have no cause of complaint.

* * * * *

The plaintiffs rely, with apparent confidence, upon the case of *Eddy* v. *Simpson*, 3 Cal., 249, but in that

case the court said when the waters of Grizzly Canyon and Bloody Run left the possession of the defendants at Cherokee Corrall, all right to, and interest in that water
6158 was lost by the defendants. It might be made the property of whomsoever chose to possess it.

* * * * *

It is very evident that the court considered the fact that the water had passed from the possession of the defendants, and found its way to Shady Creek, without their agency, as material circumstances of the case; in other words, it regarded the water as having been *abandoned.*

* * * * *

The first appropriator of the water of a stream passing through the public lands in this State, has the right to insist that the water shall be subject to his use, and enjoyment, to the extent of his original appropriation. To this extent his rights go, and no farther. In subordination to these rights subsequent appropriations may make such use of the channel of the stream as they think proper, and they may mingle with its waters other waters, and divert an equal quantity, as often as they choose.

The judgment of the court below must accordingly be reversed, and the case remanded."

This opinion by Justice FIELD, now of the Supreme Court of the United States, it cannot be denied fully recognizes the doctrine we contend for; not under peculiar California stat-

(22)

utes, not upon any anomalous principles of justice grow-
6159 ing out of the physical peculiarities of that State, but upon the plain analogies of the common law.

He refers, as will be noticed, to the case of *Eddy* v. *Simpson* (cited in Washburne on Easements as holding a contrary doctrine); and without very emphatically approving that case, distinguishes it from the one in hand by the circumstance, that the defendant claiming to have brought in water from an extra source, No. 2, was there held to have *abandoned* it to public use.

These decisions, unless we entirely misapprehended them, settle, the main question involved in the case at bar, and that, too, upon common law principles. The physical conformation and peculiar industries of Cali-

fornia, have no doubt presented cases of this kind for adjudication oftener than any other region of the Union; yet, the question has been in every instance argued and decided substantially upon common law principles, unmodified by any special legislation, precisely as was done in the New Hampshire, Massachusetts and New Jersey cases which we have cited. The court in *Hoffman* v. *Stone,* declared expressly that it acted upon the analogies of the common law, unaided by any statutory regulations. Indeed its ruling in every instance was simply an application of universal principles of natural reason and justice to the mutual rights of riparian proprietors along a natural water course; principles just as appli-
6160 cable within the borders of Illinois to parties in a like predicament, as in the mountains and valleys of California.

Burnett v. *Whitesides,* 15 Cal., 35.

Of this case the writer has no copy, nor full abstract; but in a note to I Hilliard on Torts, p. 661, we find it cited to the following effect:

"Plaintiff and defendant both drawing water from the same stream, and the plaintiff having the priority of right, if the

(23)

defendant introduce into the stream water obtained from a foreign source, he has the right to divert the quantity thus emptied into it, 'less such amount as might be lost by evaporation and other like causes'; but the water cannot be reclaimed so as to *diminish* the quantity to which the plaintiff is entitled as prior locator."

In the case at bar the State not only does not *diminish,* but in fact more than *doubles* Adam's supply. His only grievance as the record will show, consists in having a miserably poor mill-privilege improved by the State into first-class property.

See Rec., p. 23.

The case of *Elliott* v. *Fitch. R. R. Co., supra,* declares substantially the same principle as that announced in the California cases. It holds, in effect, that when A takes out from No. 1, only what he contributes from No.
6161 2 (his own reservoir), B cannot complain of a wrongful diversion; and this, not upon the principle of set-off or compensating advantage, but upon the general ground of reason and justice, that when a party withdraws from a

water course no more than he adds to it by his own improvements, it is no diversion.

In the important case, of the *Society for Establishing Manufacturers* v. *Morris Canal Co.*, 1 N. J. Equity Reports, 157, argued by most distinguished counsel of the New York, Pennsylvania and New Jersey, bar, the opinion of Chancellor Vroom is very emphatic as to the right of the defendant, *The Morris Canal Co.*, to introduce into the Rockaway river the water of Lake Hopatcung, and a branch of the Raratan, and then take out of the Rockaway below, sufficient for canal purposes, if not thereby diminishing the natural flow of the stream. "If, then," says the learned Chancellor, "the defendants take from the Rockaway no greater quantity of water than they bring in (and they claim the right to do no more), will not the Society (the complainants) enjoy their privilege

(24)

without diminution or alteration, or can they in anywise be injured?" The court in this case clearly recognizes the right of the Canal Company to use the Rockaway as a common channel to conduct the extra water to a certain point and resume its use again for the purpose of the canal, notwithstanding the fact that this water was
6162 not returned to the passaic till it passed the great falls at Paterson, where complainants' manufactories were established.

In opposition to this current of authority, we have failed to discover a single case, that when fairly read, and with careful reference to the state of facts which molded and gave complexion to the opinion, can be regarded as holding the contrary. All such as are supposed to bear adversely will be found distinguishable by one or both of two features:

1. The controversy was not between A and B (if we may still use our hypothesis, as a convenience), but between B and C. C, a still lower riparian proprietor, claiming as against B, that he (C) had a right to the benefit of the water abandoned by A, the uppermost owner, to the general future use of all the lower proprietors on the stream.

Tourtelotte v. *Phelps*, 4 Gray, 370.

2. In none of the cases where A was forbidden to divert the water contributed by himself, will it appear,

that he had made the contribution, as in the case at bar, under a comprehensive, connected plan, executed by a train of suitable structures, *to withdraw it again*, upon his own premises; but, under such circumstances that it was characterized as a permanent, irrevocable dedication to public use. Having once thus "*abandoned*" it,
6163 he was not permitted to revoke the gift.

Yet it will throw some light on this part of the argument to consult also the following authorities on the subject of artificial water courses:

Wood v. *Waugh*, 3 Exch., 748.

(25)

Angell on W. C., Sec. 433 (note 1).

2 Wash. R. Pro., 329.

Gaved v. *Martyn*, 115 E. C. L.

Broom's Leg. Max., 375.

From these, it will be seen, that so strictly have the rights of riparian proprietors been limited to the *natural* flow of the stream, that in cases where *artificial* tributaries had been continued in operation for more than twenty years by A, B, nevertheless, was held to have acquired no *prescriptive* rights therein. This strongly illustrates our position. If A can thus at any time *ad libitum* cut off the artificial tributary No. 2, and divert it into some other channel than No. 1, we ask on what principle can it be maintained that he may not, with as little injury to B's legal rights, use his own part of No. 1, as a channel to pass the water from one point to another of his own premises? How is B injured in one case more than in the other?

Upon this point we cannot conclude without again quoting a little more at length from *Hoffman* v. *Stone*, cited, *supra*.

6164 The action, as we have already stated, was brought by the owners of a ditch (which received its supply of water from Dutch Creek, or ravine, near its mouth), in El Dorado County, for the purpose of procuring a perpetual injunction against the defendants, restraining them from diverting or appropriating the waters of the said ravine. The defense was, that Dutch Gulch, was usually a dry creek, affording no natural water during the summer months, and that the defendants, in order to connect two of their canals, had precipitated the water from the upper one into the creek, and taken

the same out again, by means of a dam, into their lower ditch, and that they had not interfered with the natural water of said ravine.

The court, speaking through Chief Justice MURRAY, said:

"The former decisions of this court, in cases involving the rights of parties to appropriate waters for mining and other

(26)

purposes, have been based upon the wants of the community, and the peculiar condition of things in this state (for which there is no precedent), rather than any absolute rule of law governing such cases.

The *absence of legislation* on this subject has devolved upon the courts the necessity of framing rules for the protection of this great interest, and in determining these questions *we have conformed as nearly as*
6165 *possible to the analogies of the common law.*

* * * * *

In the case before us it is shown that Dutch Gulch was a mere torrent, dry at certain seasons of the year; that it was used by the defendants as a part of their ditch for conducting water from another stream down to their dam. That in point of fact the water so brought to Dutch Gulch, and turned in there by defendants, was not abandoned by them, but was turned in for the purpose of being conveyed to their dam. That there was, at the time of the commencement of this suit, no natural water flowing in the bed of the stream, and that all the waters so diverted by the defendants were artificial, or waters conducted there by them.

The plaintiffs being the prior locators, it would follow that any interference with the waters of Dutch Gulch would be an infraction of their rights. But the appropriation of the waters did not give them the exclusive use of the *bed* of the stream. We see no reason why it might not be used by *others as a channel for conducting water, so long as it did not interfere with their rights.* If the defendant were diverting the *natural* water of the stream, as well as that brought into it by themselves, then the plaintiffs would have a just cause of complaint. It would be a harsh rule, however,
6166 to require those engaged in these enterprises to construct an actual ditch along the whole route through

which the waters were to be carried, and to refuse them the *economy that nature*

(27)

occasionally afforded in the shape of a dry ravine, gulch or canyon. It is contended, however, that this case falls within the rule of *Eddy* v. *Simpson*, 3 Cal., and *Kelly & Co.* v. *Natoma Water Co.*, Jan. T., 1856. We do not think so. The verdict of the jury finds that the water was *not abandoned* by the defendants, and left to find its way by natural channels into Dutch Gulch, but was *turned in* by the defendants, making a connecting link of their ditch."

We now submit, that both on principle and authority, the State of Illinois, as the upper riparian owner, has the right to withdraw from the river Desplaines a quantity of water equal to that which it contributed from Lake Michigan, provided that it is done on its own premises; that its rights have not been relinquished by contract; and that it has done no act operating as a final and irrevocable abandonment thereof to public use.

THE CREATION OF WATER POWER WAS ONE OF THE OBJECTS CONTEMPLATED IN THE ORIGINAL PLAN OF THE CANAL.

An attempt was made in the argument of our opponents in the court below, to show, by referring to the several acts of the legislature, under which the Deep
6167 Cut was completed, that the water thus obtained loses its character as the proper water of the Illinois and Michigan Canal, below the Summit Level; and it seems to have made more impression upon the Appellate Court than we anticipated.

It is a matter of public history well known to the court, that the original and long cherished plan of the canal was to supply the Summit Level from Lake Michigan, precisely as it is now supplied. Much of the work, in fact, had been done before the suspension, which occurred in 1840. When the enterprise was resumed in 1845, under the well remembered trust created to secure the bondholders, the then embarrassed financial condition of the state compelled a relinquishment of the original

(28)

scheme, and the substitution of what was termed the

"raised or shallow cut," to be supplied by pumps at Bridgeport, with the aid of the Calumet Feeder.

In 1865 the City of Chicago found itself confronted by the formidable problem of drainage, for the health and comfort of its citizens; and deeming that this object might be promoted if not effectually accomplished by completing the old deep cut, already partially excavated, asked permission of the state to take hold and finish the work. Permission was given by the act of 16th April, 1865, entitled "*An Act to provide for the completion of the I. & M. C. upon the plan adopted by the State in* 1836." Besides this title, which seems
6168 significant enough, the preamble to the act contains a reference to the past history of the improvement,—the original plan,—"its abandonment for the time being,"—the precarious and unsatisfactory nature of the mode of supply from the Calumet feeder and hydraulic works at Bridgeport, and the great benefit to the canal itself to be expected by deepening the cut.

See Public Laws, 1865, *pp.* 83-4.

The work accordingly was undertaken and was completed in 1871, at an expense of several millions of dollars, and the cost soon after refunded to the City of Chicago by the state.

With all due respect to the Appellate Court we must say, as we said on a previous occasion, that we deem it unnecessary to seriously argue the point which counsel had suggested, based on the special circumstances that led to the execution of the improvement. Is it not enough that it was in fact made? Is it not enough that the deep cut is in fact an integral part of the whole canal? Is not the condition of the case, for all legal purposes, precisely the same as if the work had been done in the first instance by the state, instead of by the City of Chicago, and done in 1848 instead of 1871? Can this part of the canal, now that it is finished and paid for out of the state treasury, be

distinguished from any other part, as to the jurisdic-
6170 tion of the state over it, or over the water in it, in any respect whatever?

RIGHT OF THE CANAL COMMISSIONERS TO CREATE AND LEASE WATER POWER.

But again, the counsel for appellee, in their previous argument, expressed a doubt, whether it was quite according to law for the Canal Commissioners to create and lease water power to help repair, improve and support the canal; and to sustain this view, ransacked the canal laws *ab initio*, not forgetting the act of Congress of 1822.

To this somewhat remarkable position we reply:

1. While navigation is the *primary* and cardinal object of every navigable canal, yet, to create water power as an incident, has been the universal policy of such enterprises, whether undertaken at the public expense or by private corporations. The disposal of the water in descending from one level to another must necessarily be in the control of the state, and the public good, as we had supposed, demands both that it should be utilized in aid of the manufacturing interests of the country and made to contribute as far as possible, to the expense of maintaining the work. Such, at all events, we know, has been the unquestioned policy of the Illinois and Michigan Canal, for more than thirty years. No express statute indeed was required to make it the bounden duty of the Canal Commissioners, in the vigilant fulfillment of their public trust, to add in this
6171 way to the limited revenues of the canal, wherever they found it practicable. The particular details of administration in respect to this branch of their official charge, are necessarily confided to their own judgment and discretion. Special occasions have arisen and may again arise for special statutes on this subject; but the particular methods of creating water

(30)

power at any given place must, as a general rule, be a question for the commissioners, with the advice of their engineer.

2. The statute regulating their powers and duties expressly gives them a plenary authority to lease water power; as a recognized source of canal income.

R. St. (1874), p. 189, Sec. 8, Ch. 19.

The expression here used "and lands and lots connected therewith," cannot well be construed as intended

to exclude cases where the State happened to own no lands or lots adjoining the *locus* of the waterfall. Ordinarily such a connection would exist, but it would not, where the site occurs on a school section, as in the case here, or on Government lands. Still, unless the two subjects enumerated in the clause "water power" and "lots" are, from their nature, indissolubly incorporated together, as objects of sale or contract, they are to be taken severally. We are to look at the main design of the law; and that we cannot doubt was to utilize the surplus water for the benefit of the State, wherever possible to do so.

6172 3. But lastly, the question is entirely immaterial. If the appellee is legally entitled to the water, the point is needless;—if he is not, of course its use by the commissioners is no concern of his.

IS THE WATER ABANDONED AT LOCKPORT?

It was contended, by our opponents, and the Appellate Court seems to have yielded to their reasoning, that admitting the general principles under which we claim the right of the State to draw out above the appellee's dam the water derived from Lake Michigan, yet they are not available to us in this case; that they apply only where he who asserts them is riparian owner *continuously* for the whole distance, from the point of introduction to the point of discharge; that here the State

(31)

is not shown to own any land upon either bank of the Desplaines river between Lockport and its junction with the canal in the upper basin at Joliet; and that the water being thus allowed to escape into a foreign water course, at a point where the State has no right as a riparian owner, it must, therefore, be deemed to be abandoned, and that being abandoned it is thenceforth incorporated with the proper water of the river, so far as respects the rights of the riparian owners below.

THE INTENTION OF THE STATE.

On this point, to which the opinion of the Appellate
6173 Court gives prominence, our first inquiry will be, what was the *intention* of the State as evinced in the plan of

the canal? For it will be difficult to maintain, that anything is effectually abandoned, which the owner evidently purposes to immediately resume and control for his own future use.

To begin with, the entire plan of the canal is to be treated as a *unit,* and viewed, comprehensively; each part in its relation to every other part, however remote. The chain or system of structures composing it as a whole, must be surveyed, also, in connection with the physical peculiarities of the region through which it passes; for, in planning such a work the engineer must necessarily adapt it to the contiguous localities.

The relative course and comparative levels of the river and canal between Lockport and Joliet are shown, in a general way on the map which the court has before it.

The conditions are such, it will be seen, that the surplus water discharged at Lockport, through Norton & Co.'s tail race and through the waste weir, necessarily seeks and pursues the natural depression constituting the channel of the Desplaines river for a distance of about three miles, joining the canal again between Lock No. 4 and Dam No. 1.

And this is called an irreclaimable *abandonment,* operating

(32)

to extinguish any proprietary rights of the State in the water, and making it in a legal sense at least as to the
6174 appellee, Adam, a constituent part of the proper customary and natural flow of the Desplaines river! But now let counsel explain what they mean by *abandonment?* The only force of the term as here used is to signify some act or default of the State, by which it loses its *jus disponendi* in the water, as a subject of future exclusive control. What is it? Where do we find it? No actual *personal* intention to abandon in this sense can be imputed to the commissioners; for that is conclusively negatived by the very facts which led to this suit. The surplus in question had only come into existence in 1871, and during this short interval there surely is nothing shown in the record to indicate any such intention on the part of the canal authorities; no act, no declaration, no prolonged *non-user,* which can possibly be construed as having that effect. Indeed this lease to Slater & Druly in 1878, may have been and probably was the

first opportunity that offered for a lease of water power on this new plan, below Dam No. 2. Possibly the plan itself had not before occurred to the commissioners. At all events, there is nothing tending to show any actual purpose of the official representatives of the State to abandon, in the sense here supposed.

Again, no abandonment could be predicated upon the bare fact that the water is transferred from one level to another, provided it passes all the way through the prism of the canal or some appurtenant channel belong-
6175 ing to the State, made for that very purpose. Nor, upon the supposition that the water has been permanently and finally detached from its relations to the canal; because, it is obvious that it is destined to be taken in again but a short distance below, and, that, too, as a necessary physical consequence of the *plan* of the canal itself. This return of the water to the canal is just as certain to take

(33)

place as if the water descended from the one level to the other between the very walls of the canal.

Where then is the abandonment? It must consist, if at all, in this;—that in descending from one level to another, it makes a short *detour* through a foreign channel, situated most conveniently for the purpose, but which unfortunately does not for this intermediate distance belong to the State as riparian owner. This circumstance, quite unimportant one would think, to the beneficial rights of Mr. Adam, suggests to his counsel the notion that the instant the water passes from the premises of the State, although immediately returned again and found in the canal, long before it reaches the boundary line between the State and Adam, it becomes transformed as to him into "the natural, proper and customary flow" of the Desplaines river. Does not this approach absurdity?

The waters are mingled, it is true, and can no longer be distinguished and identified. But, as we have pre-
6176 viously remarked, this identification is not necessary to a proper adjustment of the substantial rights of the parties concerned. The water is recognized in this action only in its character as an agent of mechanical power; and any one cubic foot of the fluid, under the same conditions of fall, is precisely the same

as any other. When two or more mill owners are interested in certain proportions in a volume of water thus mingled from different sources, the quantities belonging to each can be measured with reasonable certainty, and their relative rights duly ascertained and enforced. If Mr. B, in our hypothesis is entitled to receive and does receive 10,000 cubic feet of water at his mill, how can it concern any rights or interests of his, from whence it comes, or through what previous conditions of transmission it has passed, before reaching his pond? A court of justice will not perplex itself with such fruitless and senseless trifling. It will define nothing as even a technical right except such as may be supposed to be in some possible

(34)

way and some conceivable degree beneficial to the plaintiff. But this confusion of the element of water as a mechanical agent, by the necessary intercommunication occurring between different water courses, can produce no injury to any party interested. Hence, we assume that the legal *status* of the waters in question here cannot be affected in the least by the mere circumstance of having thus commingled in one stage of their course.

6177 Again, we ask, where does the abandonment come in? It does not necessarily result from the mere fact that the State is not riparian *proprietor* in fee on the Desplaines continuously from Lockport to the point of junction at Joliet. Suppose the State had procured a *lease* or the *written consent* of all the land-owners on both sides of the river to so use the channel. Would not this have obviated the ground of objection? We have indeed no proof of any such written consent from them; but suppose that for thirty years they have in fact made no complaint of this use by the State; and have thus tacitly and impliedly acquiesced, would not the effect be the same? Now, this happens to be the precise truth here, as we may fairly infer from the record. From the very beginning the State was known to have appropriated the river to its service as a feeder, in respect to whatever water it could supply from its own sources and affluents. It is in fact named as a feeder in the Haven's release. (Record, 25.)

And this additional but homogeneous use, even if it could not be claimed as a matter of right, was not and

could not be objected to by the land owners who were already subject to the prior easement. The improved flow across their own premises could be no possible detriment to them. Those who owned mill sites would hard-
6178 ly object to the free gift of 25,000 cubic feet of water per minute to turn their wheels. They would have acquired, indeed, no vested right in this improved flow, and the State could withhold it any day, without affording

(35)

ing just ground of complaint; but while permitted to enjoy it they must be presumed from the dictates of self-interest to consent to the use of the channel made by the State for its own ulterior purposes. Now, if the river was employed as a medium of transmission with their consent, as we must presume, is not the case essentially the same as if the State happened to be riparian proprietor in fee continuously from Lockport to Dam No. 2?

But even with and against their consent, the result, we submit, would still be the same—so far as the appellee is concerned. It would in that case be exclusively and strictly a question between the State and these riparian proprietors, not affecting or concerning those above or below them in the least. If the State made an unauthorized use of their respective portions of the river, detrimental to their rights, justice would dictate that they should have redress. But how would this wrong committed upon them individually, have any proper bearing on the question, whether the State, as to Adam, had abandoned the water for his benefit? It is quite indifferent to him, one would suppose, under what relations as between the State and these upper proprie-
6179 tors the water might make its way down to Dam No. 2. In either or any case it is inevitably destined to rejoin the canal, and is accompanied all along with the constant intention of resuming control of it for alleged canal purposes.

SUMMARY.

We conclude, then, as to our first and main proposition:

1st. That an upper riparian proprietor upon a natural water course, who within his own domain puts in water from an exterior source may again take it out,

unless between the points of introduction and discharge, he has done some act or placed the water under some local conditions which, in reason

(36)

and law, amount to a renunciation of this right of exclusive control.

2nd. That the record here discloses no such act, and no such local conditions.

3rd. That it is immaterial to the issues here how the deep cut happened to get finished, or how the City of Chicago was interested in the flow of water, as effecting her problem of drainage. The summit level is at all events a constituent, integral part of the canal; and the water received into it is in precisely the same legal predicament, as if the work had been done by the State in the first instance.

4th. That except as the proposition may be qualified by special contract in respect to the rights of par-
6180 ticular individuals, all water received into the canal from whatever source, or to subserve whatever incidental object, is to be deemed the proper water of the canal to be used for all proper canal purposes; that it has universally been recognized as a legitimate object and economy of canal management to create and lease water power wherever practicable; that our statute recognizes the object in express terms, and that the right of property in the State to the water in the Illinois and Michigan Canal, with respect to that object, rests upon the same grounds as its right to water needed for purposes of navigation. The rents from mills is as desirable and legitimate a source of canal revenue as the tolls from boats.

5th. And finally, that for these reasons there has been no diversion from the mill of appellee, unless the rights of the State, in the surplus water first created in 1871, have been in some way abridged by the transaction with Haven, and Haven, in 1853.

This matter of the release will be considered hereafter.

(37)

II.

THE DIVERSION, IF ANY, BEING CONSUMMATED AT DAM NO. 2, IT CANNOT BE IMPUTED TO THE LESSEES OF WATER POWER ON A LOWER LEVEL, AS THE RESPONSIBLE AGENTS THEREOF.

6181 The oat mill of the defendants is situated on the berm bank of the canal, about a mile below Dam No. 2. At this dam, the water, that is not suffered to flow into the channel of the river and thence down to appellee's mill, is discharged into the Channahon level through the lock and a bulkhead, constructed for the purpose.

At this point, as the court has seen, the canal has entirely completed its crossing of the Desplaines river and from thence onward pursues a separate and independent course.

Hence the instant the water leaves the pool of the dam and descends into the Channahon level it becomes by a physical necessity forever detached from all relations of riparian right with the river and the mill and dam of the plaintiff.

When it reaches a point opposite the defendant's mill, it can no more be identified or recognized as river water than at a point ten miles below or at Ottawa or La Salle.

The act of *diversion*, therefore, that act which completely accomplishes the injury to the plaintiff, if any there be, takes place at Dam No. 2; for it must *ex vi termini* consist in that operation, or series of operations, by which the water, instead of being suffered to
6182 flow over the dam into the river channel and down to Adam's wheels, is irrevocably turned away in another direction. And in this operation, performed as it must be, by the functionaries of the State, in the official administration of the affairs of the canal, the defendants, we humbly submit, can be supposed to exercise no responsible agency. The stage of water in the Channahon level from time to time, and

the methods of supplying it, are matters of exclusive official cognizance and regulation, in which third persons have no concern.

The water being by this process already irrevocably

diverted Adam, as a riparian proprietor, has no further concern with it. In its mere character as a physical substance, he sets up no right to it in this suit. The *use* is all he claims, and he can assert no *usufructary* right, except where he finds it existing under such local relations to his mill, that *he* himself could use it as a motive power, if the defendants did not. But is it not obvious, that when the water has reached down to a point opposite their head gates, it can be of no *benefit* to him in any possible event, and it therefore can be no *injury* to him, if used by others? If the use of it by Slater & Druly was no legal *injury* to him, how can it be denominated a diversion in the sense of the law? Does it not seem too plain for serious dispute, that the act of diversion, if any, is performed at the point where the road forks, so to speak, and is there performed by the
6183 sole agency of the officers of the State, in the execution of their public duties? The only claim of the appellee to the water, we repeat, is that of *user* for hydraulic purposes at his mill, and so the declaration expressly describes it. He asserts no right to it otherwise; and this usufructuary interest is only supposable under conditions which make it possible for *him* to use it at *his* mill. After it has passed down and out from these conditions, and is found in some place entirely beyond their range, certainly it can no longer afford a cause of action to him.

But it is said, that the lessees of the water power became joint wrongdoers with the official agents of the State, by accepting the lease. They knew, or were bound to know, that the water they contracted to receive was due to Adam, and thus in law became parties to the diversion. We cannot think the view tenable at all.

While the State in its relations with its citizens is in justice

(39)

bound to afford redress for wrongs of this description, if wrongs they be, done under its authority, yet it is an express requirement of our public policy, that relief in such cases should be sought from the Legislature by petition, rather than from the courts by action. No application of this principle can be more obvious, than to the
6184 affairs of the canal; and especially to a case like this at bar. The commissioners, and their executive officers, by

authority from them, are invested with entire jurisdiction over the canal and its waters and over all its operations in regulating the stage of water from time to time on the several levels. In dealing with these representatives of the State in respect to the water of the canal at any given point in the line, it would be most unjust to ask private individuals to inquire at their peril as to the particular sources from which the water was derived, and the special conditions of private right to which it might be subject here and there. *There* is the water, within the banks of the Illinois and Michigan Canal, in the undisputed and absolute possession of the agents of the State; a possession, which whether right or wrong, no one can interfere with. What could Slater & Druly be supposed to know, when they took their lease, about this old Havens settlement in 1853, if indeed it ought to cut any figure in the case at all? The persons controlling and regulating the stage of water in the several levels, and its transmission from one to another were public officers, acting under official responsibility, and presumed from every *prima facie* indication of authority, to be acting rightly.

Ballance v. *Underhill*, 3 Scam., 453.
Glancy v. *Ellcott*, 14 Ill., 456.
Todemier v. *Aspinwall*, 43 Ill., 401.

6185 They appeared to be in the full undisputed possession of the water; and, by all the analogies of the law, that possession was presumptive evidence to third persons of a plenary

(40)

right to control it. In fact the presumption ought, we think, to be stronger here, than in ordinary cases of the possession of property, which could be physically identified and distinguished; for, it is impossible to make any discrimination, based on diverse proprietary rights, in regard to the aggregate mass of water contained in the canal. But it may be argued that the defendants knew the local relations of the canal and river, and therefore the rights of Adam; because, these rights were inferable from those relations. This would be carrying the rule relied on very far. Two courts have passed on the question and have differed diametrically in their opinion. Were these plain grinders of oat meal to "know the true

prince by instinct," when wise judges thus differed, after elaborate argument?

But the learned judge delivering the opinion of the Appellate Court, places his main stress, if we understand him correctly, upon the release from Haven & Haven, as going far to establish the rights of Adam. With all due deference, we cannot but think and shall endeavor respectfully to show, that the court was here in error; but, be this as it may, what evidence is there in this record, that these lessees before this suit was brought knew anything about that release? And what was there
6186 to put them upon inquiry?

When public officers, in managing public property, under a discretionary legal authority, which is *prima facie* sufficient, contract in any instance with individuals, and under that contract act jointly with them, the *scienter*, the tortious intent would seem to be indispensable to make their co-contractors joint tort feasors.

Hilliard on Torts, Vol. 2, pp. 155-255.

Main v. *McCarty*, 15 Ill., 441.

Jermaine v. *Wagner*, 1 Hill (N. Y.), 284.

In the case late cited, decided by the Supreme Court, of the

(41)

State of New York, acts done under the authority of the Canal Commissioners of that State were sought to be justified "because the canal commissioners had jurisdiction of the subject matter;" and it was argued, that "although the latter might not be protected, yet the defendants should be, inasmuch as they acted under the direction of a body which was *prima facie* authorized to give the direction." The court seem to have fully recognized the general principle for which we contend, but held in that case that the commissioners had no *prima facie* authority.

In this connection, it may not be unworthy of notice as a consideration of some significance, that the Canal Commissioners are themselves exempted by law from being sued.

R. S., Ch. 19, Sec. 3.

6187 The object of this is manifest. It was deemed mischievous to the public interests, that the acts of the commissioners, who are declared "for all legal purposes" to be "officers of the State" should be left lia-

ble to the vexations and obstructions of daily litigation. How far this exemption ought to be extended, or whether it is subject to any exceptions, we need not say. It is very clear, at all events, that a case like this, of all others, falls within the scope of the policy thus established. This on its very face is a square direct contest between William Adam and the State of Illinois; involving a question of public concern; whether the surplus water drawn from Lake Michigan by a cut through miles of solid rock at a cost of millions of dollars, belongs to him and his little 7 by 9 mill, or to the State of Illinois. If he is aggrieved by the State, the constitution denies him any method of redress, save one supposed to be ample under a just and enlightened government, and that is, to lay his case before the General Assembly. But this he conceived would be an inconvenient, perhaps an expensive, and certainly a very *hazardous* experiment; so he

(42)

casts about him for some way to evade the constitution and the laws, and finally brings suit against these innocent lessees, who had erected a large and expensive mill, upon the faith of their contract with the official agents of the State of Illinois. The point we have been
6188 considering is entirely needless, as we suppose, for our defense, and we shall expend no more labor upon it; but it will be for the court to say, whether such a suit is not a palpable evasion of our policy, as to the administration of public property; and if so, whether it ought to be favored or maintained. If the tort is by statute no tort against the State or its officers, ought it in justice to be held a tort against these lessees?

If not, how can they be described as joint tort feasors, upon the general principles connecting joint trespassers in responsibility?

III.

THE HAVENS RELEASE.

The point made on the trial of the cause, that the release executed by the plaintiff's grantors, Haven and Haven, in 1853, operated as a bar to the action, we do not care to press at much length in argument here. It does not touch the main and really interesting question

in the case, on which the opinion of the court is desired; and is we hope, entirely superfluous for any necessary purpose of defense. A word therefore in reference to it will suffice.

The question is one of fair construction. On expression in the release, if taken literally, limits its operation to "purposes of navigation as contradistinguished from any other purpose." It is argued, and, we con-
6189 fess, not without plausibility, that this excludes the idea of a full and complete power of disposition over the water taken. But the grant, although expressed to

(43)

be for "purposes of navigation," was in practical effect a grant of the entire stream; unless construed as subject to a tacit condition that the trustees should always maintain its other feeders *in statu quo*, and that the Desplaines should only be required to furnish for purposes of navigation, its proportionate share, *in conjunction* with those other feeders. We are not convinced that the trustees in this compromise meant to so bind themselves. It would hardly comport with public policy, that the rights of the State in reference to any one of its several feeders should be hampered by such a restriction, precluding it from any future change in its system of supply, however expedient, without incurring the risk of forfeiture. We think, that while it was not then deemed probable that there would be any material alteration, yet, the river was turned over to the trustees as a feeder for any and all the uses and purposes attributable to any canal feeder. To employ the term "for purposes of navigation," as a term of cautious limitation, in connection with this contemptible rivulet and the Havens' still more contemptible interest in it, would have been ridiculous. If the State had the right to the whole of it, irrespective of other feeders, to fill the level, it was perfectly well known that there never could be to the end of time a *surplus* to use for water power; and
6190 hence we felt justified in contending on the trial that the release, when fairly construed, was intended to be general and unlimited; and the entire waters of the river turned over to the trustees to use at their discretion. Even an arrangement of that kind must have been regarded by the Havens as highly advantageous to them; because this court had just decided in 11th Ill. that they

were riparian owners only on one side, that their dam was wholly unauthorized beyond the center of the stream, that they were at the mercy of the State, as the owner of the opposite bank, for their power; and that they could expect no more than nominal damages by any assessment that the courts would sustain. The compro-

(44)

mise was assented to by the trustees, because on their part they did not choose to be harassed with perpetual suits for even nominal damages.

The Appellate Court, however, if we rightly apprehend its decision, adopted the conclusion, not only that the release was no bar to the action, but that it even had the effect of giving to the plaintiff as grantee of the Havens, a right to claim as riparian owner this vast additional volume of water, produced eighteen years afterwards by an improvement which entirely revolutionized the former system of supply—an addition exceeding, probably, twenty times the natural flow of the Desplaines in 1853!

6191 Holding that court, as we do, in the highest respect, we must nevertheless, be permitted to insist here most strenuously and confidently that their position is unwarranted by any just construction of the release.

The whole transaction between the Havens and the Canal Trustees had reference to the *state of things then existing.*

The canal had been completed in 1848 upon the shallow cut or raised level plan, as the best the State in those hard times could do. Instead of a direct and never-failing supply from the lake, the level was to be supplied by the poor expedient of pumps at Bridgeport, reinforced by the Calumet, and the feeble and uncertain tributes in spring and fall of the little Desplaines. There are probably upon the bench of this court those who personally know how little anybody in Illinois at that early day expected the time would ever come, when this channel would be carved deep through miles of solid rock to the inexhaustible bosom of the lake. It is fair to affirm positively, that neither of the parties to this agreement, the Havens or the Trustees, thought of such a thing as the ultimate finishing of the Deep Cut, any more than they thought of the millennium. In fact at that

time the railroad era had dawned in Illinois, putting water communications completely in the

(45)

background, and making it exceedingly doubtful whether the State would ever spend another dollar on that kind of internal improvements. But the release itself contains abundant intrinsic evidence, that the whole arrangement had reference to the particular state of facts existing in 1853. It recites the claim of the releasors as riparian owners on the Desplaines river, that they had suffered damage by the diversion of the water belonging to them as such owners, the legal proceedings pending to settle the question in dispute, and the expediency of stopping the litigation, by compromise; and then proceeds to set forth the terms of adjustment agreed on. Some disputed questions, it is true, had already been adjudicated in this court.

Canal Trustees v. *Haven*, 5 Gil., 556.

Same v. *Same*, 11 Ill., 554.

In the first case, which went up on an agreement as to the facts, it was decided that the Act of Congress of 1822 did not apply to school sections, that although the Desplaines river had been meandered, the grantees from the Government took to the center of the stream, and that the Havens were to be regarded as riparian proprietors, and as such entitled to recover for any diversion of the water *of the river*. In the second case, it was decided, that the Havens were riparian owners only on the east bank; but were entitled to at least nominal damages. Both cases, as will be seen, simply recognize the old familiar common law rules on the subject
6193 of riparian ownership and diversion. At all events, it is entirely certain that in neither was there a single intimation that the Havens occupied any other position than that of ordinary riparian owners on a natural water course; or that, from the peculiar relations between the river and the canal, they could claim damages for the diversion of any water other than that which could be shown to be the natural, customary and proper flow of their stream.

(46)

Nor did the release contemplate any extension or modification of their common law rights as riparian owners, further than this, that the State, as represented and

bound by the canal trustees, might perhaps be held to have virtually acquiesced in their right to thereafter maintain their *dam* across the whole width of the river to the bank of the canal, using that bank for their west abutment;—a right which they did not possess before. But the learned judge who speaks for the Appellate Court, argues, that at that time, in 1853, the surplus water from the summit level, discharged at Lockport into the Desplaines, came down to the pool above Dam No. 2, by precisely the same process as does the immensely increased flow now; and that the trustees, in *accepting* this release virtually recognized this surplus as a part of the legitimate flow of the river, for the diversion of
6194 which the Havens were entitled to damage. Where did the court find in the record in this case any warrant for such a proposition? Certainly not in either of the decisions of this court which have been cited. Certainly in no express grant, declaration, or admission of the trustees, for they made none. Certainly not in the language of the release, because it nowhere speaks of the water in dispute, otherwise than as "the waters of said Desplaines river." But what were the waters of the Desplaines river? The particular point arising here was not referred to in either of the decisions of this court. It is quite evident it was not considered in the assessment of damages, from which the second appeal was taken. In the opinion (11th Ill., 554), Justice TREAT speaks only of "diverting the *water of the river* from its natural channel,"—"of the use of the water as it is *accustomed* to flow along the channel,"—of the right "to use the whole of the water naturally passing down the channel,"—of the H's being "entitled to use but half the water naturally flowing along the channel,"—of their duty "to use it as it is accustomed to flow down the channel," &c.,—language appro-

priate only to a case where the water in question was recognized as being that which was "accustomed" to flow through the water course under consideration. And what is meant in the text books and adjudged cases, by water *naturally* flowing, and water *accustomed* to flow?
6195 Are not these the terms always used to define the ordinary and proper flow of a natural water course, with no possible reference to the exceptional case, in which

an upper owner happens to have improved the stream from a reservoir of his own?

In 1853, the canal had been in operation but five years. During this time, it is true, the surplus from the summit level had passed down the river to its junction with the canal in the upper basin as it does now, and as the plan of the canal required. Was this sufficient to make it in the eye of the law an ordinary and customary flow? Could even twenty years have created a right by prescription against the State? Could not the State, if it had chosen, and if it had been practicable, stopped at any time this flow through the river and discharged this surplus through some other channel? Who can doubt it? But when the parties got together for a settlement, the occasion had passed for any such belligerent analysis of rights, and probably these considerations were not mentioned or thought of at all. How then can it now be contended that by *accepting* that release the trustees estopped themselves and estopped the State forever from asserting against the Havens or their grantee, that the contribution to the river from the Lockport mills and spillway in 1853, was not a part of its natural and customary flow? This court once said: "It is a familiar doctrine that the State is not embraced within the statute of limitations, unless specially named,
6196 and by analogy would not fall within the doctrine of estoppel. Its rights, revenues and property would be at a fearful hazard, should this doctrine be applicable to a State? A great and overshadowing public policy of preserving these rights, revenues and prop-

(48)

erty from injury and loss by the negligence of public officers forbids the application of the doctrine."

The People v. *Brown*, 67 Ill., 438.

On this point, therefore, we conclude, that the Havens release is to be construed with reference to the state of facts or circumstances surrounding the parties at the time it was executed; that in the suit of which it was the final adjustment, they appear to have set up no claim save that of ordinary riparian proprietors, that is to say, a claim to the water as it was accustomed to flow in the natural channel of the Desplaines river; that there never had been a judicial determination or intimation, to the effect that the addition to that customary

flow, produced by the discharge from the hydraulic basin and spillway at Lockport was or had become by lapse of time or contract or otherwise a part of such customary flow in any legal sense, and that there is nothing in the release itself importing any such claim. It seems too plain for argument. One of two things must be true;—either the question was considered by the parties in their settlement, or it was not. If it was *not*, then the accept-
6197 ance of the release cannot be now set up by way of estoppel to preclude the State or its grantees from raising the point;—if it *was*, then the terms employed conclusively demonstrate, that the Havens did not expressly make and therefore could not be understood as intending to make any such claim.

But be this as it may, even conceding that in 1853 the trustees in treating with the Havens did not choose to notice the distinction between the natural flow of the river and the artificial addition supplied from the canal itself, and were willing to recognize the whole aggregate volume indiscriminately as river water,—such an agreement as that even cannot be construed as contemplating or embracing the unlooked for state of things existing now. They, and nobody then could have fore-

(49)

seen that in the lapse of eighteen years, by a somewhat remarkable and entirely unlooked for train of causes, the long suspended deep cut would at last be finished, the whole system of supply for the summit, Joliet and Channahon levels totally revolutionized; and the Desplaines in its character as a feeder completely wiped out from the map. The first canon of construction in expounding contracts, and the one which really involves all others, is to get at the intention of the parties. To do this, the courts place themselves "as far as possible" in the position of "the parties when they made the contract, by possessing themselves of the circumstances
6198 which they had in view during the negotiations."

Stout v. *Whitney*, 12 Ill., 227.

Wilcox v. *McGhee*, 11 Ill., 381.

Hadden v. *Schoutz*, 15 Ill., 582.

Now waiving all advantage from the rule that grants are to be taken most strongly against the grantor, and the equally familiar rule that in favor of the Government even its own grants are to be construed strictly as

against the adverse party and favorably for itself, let us place ourselves in the canal office in 1853. The Desplaines was not much of a stream, but the trustees wanted to control it as a feeder for whatever it was worth, without the liability of incessant lawsuits. The Havens making their appearance before the board in a simple character of riparian proprietors on the east bank, as holding title to lot 1, block 57, School Section Addition to Joliet, agree to execute a perpetual release of damages for $3,000. Suppose the president of the board had said—"Perhaps the State may in a few years finish the deep cut, supplying, say, 25,000 cubic feet of water per minute, enough for navigation and an immense surplus besides for water-power at Lockport and Joliet. Now if in this event she shall turn over Dam No. 2, into your mill pond, or at least double the quantity of water you are getting now, and probably ten times what you got before the canal was opened, thus con-
6199 verting your little mill into first-class property, do you mean to sue anybody for *damages*, should our successors, the Canal Commissioners, find it expedient to use the rest of the water somewhere on the Channahon level?" Judging from this paper and the attendant circumstances, what likely would have been their answer? Tenacious as they had been of their rights, they had never put forth a claim so absurd as this. They had never claimed a foot of water to which they could not show themselves entitled as riparian proprietors by the strict rules of the common law. They had never sought to recover damages for diverting a foot of water which could not be legally defined as water "accustomed" to flow in the Desplaines river. Their answer assuredly would have been: "We convey to you our rights, such as they are, in the Desplaines as a feeder. You are of course at liberty to use it as a feeder as long as you choose, and to dispense with it whenever you choose, it is immaterial to us. If at some future time you or the State should abandon the present system altogether, so that instead of the river feeding the canal, the canal should incidentally feed the river, largely augmenting its flow, and enhancing our water-power, we shall be duly thankful for such good fortune, and will give you bond and security never to bring suit against anybody for such a blessed *diversion* as that."

It is indeed hard to deal with a claim so provokingly absurd and unjust with equanimity and decorum, es-
6200 pecially to one who has watched the water flowing over Dam No. 2 for thirty-five years, and seen the advancement of this poor, forlorn Havens mill to its present condition. Here the State of Illinois at an enormous expense has made this great improvement for the general good. The canal at best has a hard time of it to get along, and sorely needs every dollar of revenue it can obtain from every source. It now happens to possess a large surplus

(51)

of water which is available with profit for hydraulic power. The fall of the canal is such that it can be repeatedly used, first at Lockport, again at Dam No. 1, and finally at Dam No. 2. After the experience of a few years, the commissioners have discovered that the amount of water at their disposal at Joliet is so great, that after leasing all that can possibly be leased to advantage at the dam, and after sending down to the appellee's mill double the amount he had ever received before, there is still a considerable surplus that can only be utilized at all on the plan here brought to the notice of the court. Instead of leaving it as a monopoly in the hands of Adam and the several lessees at Dam No. 2, limiting the area of manufacturing establishments in Joliet to *their particular* district, this scheme operates to distribute the benefit of this hydraulic power over territory well situated for such industries, adjoining the west bank of the canal for a long distance, perhaps a mile or more. But now this appellee, equally grateful and modest, comes
6201 into court and claims, that the water is *his*, and that the water rents must be paid to *him*, instead of going into the coffers of the state. He hardly pretends that the millions that were expended on the works, through which Lake Michigan rolls down to Joliet, were altogether contributed by him. He generously leaves to the state undisturbed the responsibility and expense of repairing, maintaining, superintending and operating the canal. For his own part he is content with the humble post of gobbling up the accruing revenues.

For the reasons, thus presented at length which only the importance of the case could justify, we respectfully

submit, that the judgment of the Appellate Court ought to be reversed.

G. D. A. PARKS,
E. F. BULL,
Attorneys for Appellant.

(1)

IN THE SUPREME COURT OF ILLINOIS,

Northern Grand Division.

September Term, A. D. 1881.

6203

WM. DRULEY, *Appellant,*

vs.

WILLIAM ADAM, *Appellee.*

Appeal from Appellate Court of Second District.

ADDITIONAL BRIEF FOR APPELLANT.

We think in our former brief that we have shown, both upon principle and authority, that a riparian proprietor on a natural water course is entitled, and *only* entitled, to receive from the proprietor above *the proper, natural and customary flow of the stream, unimpaired in quantity,* and in the condition of fall necessary to make it reasonably useful to him; but this rule applies only to the water *naturally and customarily* flowing in the stream. It will, perhaps, in this connection be advisable for us to review more fully than we have the

(2)

6204 authorities which were relied upon by counsel for appellees in the Appellate Court, and to consider some of the positions there assumed by them.

I.

Appellee in the Appellate Court made the proposition that "a lower riparian proprietor has the right to the use of all water which may be added to a stream by a

higher proprietor, no matter for what purpose, and it matters not that the addition was made at the entire expense of the upper proprietor and withdrawn before reaching the land of the lower," and in support thereof cited several authorities to which we desire briefly to call the attention of the court. It seems to us that none of them are applicable to the point made in the case at bar.

Tourtolotte v. *Phelps,* 4th Gray, Mass., 370, turned entirely upon the construction of certain deeds of conveyance, and the question in the case is expressly stated to be "the extent of the defendant's right at his shop" under certain deeds of conveyance introduced in evidence. The defendant in that case did not seek to assert nor claim the right to withdraw from the stream water he had added thereto, nor was that question in the case, either directly or indirectly, nor has that court in that case attempted to pass upon this question. The nearest approach in the opinion to the question urged by ap-
6205 pellee will be found on page 376, and is as follows:

"One consideration is important to the present inquiry: It is this: That as each proprietor through whose land a water course passes has a right to the natural flow and descent of the water course subject to the like reasonable use by all others, he *necessarily* enjoys the

(3)

benefit of any improvement made by the proprietors above him. If they increase the head waters for useful purposes by *flowing increased areas of land* and by making reservoirs to preserve surplus waters for dry seasons, and thus increases the volume of water for hydraulic purposes, every lower proprietor *necessarily* enjoys the benefit of it; but in such case no mill owner below the first and nearest the meadow or land flowed can be liable to the land owner for damages. He has done the land owner no wrong by having the increased volume of water at his works, whether he uses it or not; such increased volume of water was inevitable by him; he hadn't caused it, and could not prevent it. He would not be responsible to the land owner for damages caused by flowing his land, because it was not caused by his dam, but by some one above him, for whose doing he would not be responsible."

The improvements here spoken of are not those caused

by an addition to the waters of the stream from other sources, but simply consisted of the construction of reservoirs whereby the surplus water was preserved for dry seasons. Of course the lower riparian proprietors *necessarily* enjoyed the benefit of the reservoirs constructed
6206 above to retain the waters for the seasons of drought. The upper proprietors could not, from the nature of the case, enjoy the benefits of their improvements without conferring corresponding benefits on those below them. One of the questions in the case cited was as to the liability of the defendant for the overflow of a certain meadow land belonging to the plaintiff. It was held that the defendant was not liable, *although* he used the water thus held back and preserved by the dam, for the reason that it was not his dam that penned up and flowed back this water, but the dam of the upper proprietor. It was true that *he* de-

(4)

rived a benefit from the construction of this dam and the preservation of the surplus waters; but he did not build the dam nor in any manner aided in its construction, and it was therefore held that he was not liable for the damages caused by this overflow. Upon the same principle it can be asserted that the appellant here is not liable, even if, as between appellee and the state, appellee is entitled to the waters brought through the deep cut at the summit level, for it was not appellant's dam that caused a diversion of the water from the Desplaines river into the canal, but it was the dam of the people of the State of Illinois, the owners of the canal; and at the point where
6207 appellant drew this water from the canal the water was in the absolute and undisputed possession of the state and subject to the control of the Canal Commissioners, and subject to that control, too, not by reason of any act or assent on behalf of the appellant, but by reason of an act of the Canal Commissioners, for which he was in no manner responsible.

The next case cited by appellee in the Appellate Court in support of his claim to the water procured through the summit level from Lake Michigan was *Webb* v. *Portland Manufacturing Co.*, 3 Sumner, p. 189. There were but two questions in that case, and I quote from the opinion of the court, page 191:

"The first is whether to maintain the present suit it is essential for the plaintiff to show any actual damage. The second is whether in point of law a mill owner having a right to a certain portion of the water of a stream for use of his mill at a particular dam has a right to draw off the same or any less quantity of the water at a considerable distance above the dam without the consent of the owners of other mills on the same dam."

It will be seen that neither

(5)

of these questions affects the question at issue, nor is the question at issue in any manner discussed in the opinion.

It was held in that case that the defendant by drawing off the water, to which he claimed to be entitled, from
6208 the pond at some distance above the dam, necessarily decreased the amount of the head which the mill owners located at the dam would otherwise have, and to that extent they were injured, and for such injuries were entitled to maintain their bill. It was also claimed in that case that the defendants had fully indemnified the plaintiff from injury, and in fact conferred a benefit upon him by creating a reservoir higher up the stream so as to be capable of affording a full supply in the dryest seasons: but it was held that the plaintiff had no interest in such dam, could not compel its maintenance, nor could he be compelled to take any benefits that he might necessarily derive therefrom in lieu of his natural right to a full head of water at his dam.

The third case relied upon is that of *Swindon Water Works* v. *W. & B. Canal Co.*, 14 Moaks, (Eng. R.), 86, but that case has not the remotest analogy in any respect to the case at bar. The Swindon Water Works Company claimed the right as upper proprietors of the stream to divert all the water for the purpose of supplying the town of Swindon, and by this means prevent any portion thereof finding its way to the lower proprietor, which the English House of Lords very properly held they had no right to do.

6209 The next case cited is that of *Batavia Manufacturing Co.* v. *Newton*, 91 Ill., 230. But no such question was before this court in this case, nor did this court even by way of argument say anything in that case that can be

properly construed in support of such a proposition. The only con-

(6)

tention between the parties was as stated by Mr. Justice Scholfield (page 234):

"The plaintiff claims a preference of twelve hundred square inches, while the defendant contends that it is entitled to but six hundred square inches. The ruling was in favor of the contention of the defendant."

And the settlement of this question depended entirely upon the construction of certain deeds of conveyance which had been introduced in evidence and formed a part of the record.

By way of illustration, Justice Scholfield uses the language relied upon by appellee, page 241; but the court will see that the *illustration* is with reference to water that was supposed to have been added to the natural stream, had commingled therewith and had reached *the joint possession* of the riparian proprietors at their *common dam*, and simply asserts that such contribution was to the common pond, in which each were jointly interested, and that such fact would not entitle the person supplying the same to a PREFERENCE IN ITS USE AT THE DAM; but even *that* question was not before the court in that case, much less can it be claimed that this illustra-
6210 tion supports the claim made that if an upper riparian proprietor has added to the natural waters of a stream by artificial means, and for his own purposes, he has no right, for his own use, to withdraw the same or a like quantity from the stream *before* it reaches the possession of the lower proprietor.

The next is that of *Eddy* v. *Simpson*, 3 Cal., 249, and comes nearer than any other case cited in support of the proposition contended for. but still, when carefully considered, falls far short, and unfortunately for the appellee has been expressly held by later cases in the same court not to bear the construction sought to be placed upon it, and if ca-

(7)

pable of bearing such construction, has been expressly overruled by the cases heretofore cited by us. In that case it was held that the water which it was sought to withdraw from the stream had, without the agency of the

defendants found its way into Shady Creek, *joining the waters then in the possession of the plaintiffs, and became a part of the body of water used and possessed by the plaintiffs,* that the defendants had abandoned the water and lost all right therein, and therefore had no right, *after it had come into the possession of the plaintiffs,* to withdraw the same from the plaintiffs' possession. It seems to us that if it was true, as found in the case last cited, that the waters had been abandoned by
6211 the defendant and allowed without his agency to flow into possession of the plaintiffs, that the defendant would have no right, either natural or legal, to withdraw the same from the possession of the plaintiff. And this concession in no manner militates against the claim made by us. Here the water was withdrawn by the party who supplied the same *before* it came into the possession of the plaintiff. What he complains of is that the water *was not permitted to come into his possession.*

It was claimed by counsel for appellee in the Appellate Court, and will undoubtedly be insisted upon here, that the California cases are not of a general applicability for the reason that they are, as it is claimed, founded on the situation of the parties and the customs and laws of California. From the peculiar situation of many of the water rights in California, the precise question at issue has arisen more frequently in that state than in all other localities combined; but the Supreme Court of California distinctly assert that they base their opinion *upon common law principles,* applying to the

(8)

peculiar condition of things in California well established rules of the common law. At common law a person in order to be entitled to the use of water in a running stream must be a riparian proprietor; that is, he must own the soil upon either one or both of the banks of the
6212 stream, and unless he was such owner he had no right to claim any interest in the use of the water, unless such interest had been acquired by grant or prescription. In California, however, in most instances the fee to the streams at the time this question arose was in the Government. Strictly speaking, there were no riparian proprietors except the Government, but from the earliest settlement of the state the person who, for the purpose of

operating mines, or for irrigation, first dammed up and controlled the waters of a stream was treated and considered as having a proprietary interest in the use of such water as against all persons other than the Government, or those claiming under the Government. The development of the mines of California required the protection of parties who had expended large sums of money and a large amount of labor in controlling for useful purposes the waters of a running stream. And so the courts, applying common law principles to the existing state of facts, say that they will treat the first appropriator of the waters of a running stream, in all cases where the Government is the proprietor, as the person entitled to the use of such waters; and this, too, notwithstanding he may have no interest in the soil over or through which the stream runs. Such ruling was a proper application of well established rules of justice to the state of facts there found to exist. Such being the
6213 case, and the first appropriator of the waters of a running stream being treated and considered as the true owner thereof, so far as the use of

(9)

such waters was concerned, the question in the case cited by us from California arose, and as the Supreme Court of California say, by the application of common law principles they find that a person who has added to the waters of a stream may draw from such waters a like amount. The only departure from strict common law principles being in treating the first appropriator of the waters of a stream as the true riparian owner as against all persons except the Government and those claiming by grant from the Government, such persons so treated as the true owners being entitled to the *same* rights to be determined in the *same manner* as persons who are riparian proprietors at common law.

II.

We desire also to call the particular attention of the court to the facts appearing in several of the cases referred to in our former brief; but, before doing so, will state as a proposition which we think is fully sustained by the authorities, that in no case is a party liable to a

lower land owner for diverting water if actual damage has not been done.

6214 *Wadsworth* v. *Tillotson*, 15 Conn., 366.
Gillet v. *Johnson*, 30 Conn., 180.
Seeley v. *Brush*, 35 Conn., 419.
Chatfield v. *Wilson*, 31 Vt., 358.
Gerish v. *New Market Mfg. Co.*, 30 N. H., 478-483.
Pollitt v. *Long*, 58 Barber, 20.
Dilling v. *Murray*, 6 Ind., 324.
Williams v. *Mooreland*, 2 Barn. & C., 910.
Mason v. *Hill*, 3 Barn. & Add., 304.
Mason v. *Hill*, 5 Barn. & Add., 1.
Embry v. *Owen*, 6 Ex., 358.
Wood v. *Wadd*, 3 Ex., 748-781.
3 Kent Com., 441, note 1, 12th Ed.

(10)

Of course this rule does not apply if there has been such a diversion of the water as would, if persisted in for twenty years, grow into a prescriptive right to the use of the water thus diverted, to the prejudice of the lower proprietor, for in such case the law implies damage, though none be shown. We do not contend that a lower riparian proprietor is bound, in order to be protected in his rights, to be in the actual use of the water power. The doctrine seems to be well established that an *improper* or *unreasonable* diversion of the NATURAL waters of a stream works an injury to the lower proprietor, even if he is not in a condition at the time of such
6215 diversion to apply the water to his own use, for the reason that such diversion, if continued in for a period of twenty years, may result in a prescriptive right to his prejudice. But this rule only applies to the NATURAL waters of the stream, and it *only applies in cases where the diversion is an unreasonable one.* This doctrine seems to be conclusively settled by Chief Justice Shaw, in *Elliott* v. *Fitchburg R. R. Co.*, 10 Cush., 191. In that case one Clark was an upper, and Eliott, the plaintiff, a lower riparian proprietor upon a stream. Clark had deeded to the railroad company a perpetual right and privilege to make and maintain a dam and reservoir on this stream and to draw and use the water therefrom. In pursuance of the right thus conveyed the railroad company had erected a dam across the stream below a spring on Clark's land, by such dam had made a reservoir

and inserted a pipe therein from which they took the water from the reservoir for the purpose of supplying their depot at Sherly, and used the same in supplying their locomotives, and for other similar purposes, the defendants proved that Clark's meadow, through which the creek run, was wet and springy, and that

(11)

he had cut ditches across the meadow to the brook, *thereby increasing the flow of water to the brook; and it was further proved that there is no outlet for the water of said meadow, except into the brook,* and that the meadow
6216 was situated below the dam. Page 102.

"The plaintiff contended that if the jury were satisfied of the existence of the brook as alleged, and the diversion of the water therefrom by the defendants, he was entitled to a verdict for *nominal* damages without proof of *actual* damage; but the presiding judge instructed the jury that unless the plaintiff suffered *actual* damage in consequence of the diversion, the defendants were not liable in this action. *In connection with this instruction the judge further instructed the jury that if they believed that the defendants by excavating said reservoir, and spring above the dam, or that said Clark by digging said ditches had increased the flow of water in said brook equal to the quantity of water the defendants had diverted therefrom, then the defendants were not liable in this action.* The whole court are of opinion that this direction was right in both particulars."

It has been suggested by counsel for appellee that this case was determined upon the peculiar statutes of the State of Massachusetts in relation to mill rights. In this counsel are in error. The court say, after having considered the question raised upon the first direction to the jury, (that is, that the plaintiff must show an actual damage in order to be entitled to recover):

"We consider the other direction correct also, as we
6217 understand it. The question was not (if the defendants have caused damage to the plaintiff amounting in law to a disturbance of his right, for which an action would lie) whether it would be barred by an advantage of equal value conferred in the nature of a set-off, *but whether the*

(12)

improvements of Clark upon his meadow taken together

as a whole, including the dam and ditches as parts of one and the same improvement, any damage was done to the plaintiff; and this we think was correctly so left.

It may, perhaps, be proper to guard against misconstruction in considering what are the general rights and duties of persons owning lands bounding on running streams by the general rules of law and for general purposes, that some alterations of these rules may be effected in Massachusetts, by the act of legislation on that subject in respect to mills, and the constructions which have been judicially put upon such legislative acts. * * * It is not necessary, however, to go into this subject, but merely to say that the rights to streams of running water upon which the present question turns *are not dependent upon or affected by the mill acts.*"

It was insisted by the counsel for appellee in the Appellate Court that the case of *Whittier* v. *Cocheco Mfg. Co.*, 9 N. H., 454, was not in point, for the reason as contended that the manner of the enjoyment of the water by the defendants was consistent with the manner in which
6218 they had used the same for fifty years, and that they were not obliged to pen it back for plaintiff's benefit. The case will be better understood by the following diagram?

(13)

The Cocheco river runs, as we understand the case, in an easterly direction from its source to its mouth. At the point designated Waldron's Falls there was a dam, and on the northerly side of the river the defendants and their grantors had, for a period of fifty years, been in the enjoyment of a certain water power privilege. On the southerly side of the river the plaintiff, by virtue of the conveyance to him, became seized of a water power privilege, under which he was entitled to a portion of the water formed in the mill-pond above the dam that furnishes the water power under which the defendants claimed. Under these circumstances the defendants, to increase the flow of water to their water privilege, had constructed a reservoir at Bow pond, some distance above the dam, at Waldron's Falls, and in this reservoir the water was dammed back and kept for use during a season of low water. Subsequent to the
6219 time that the plaintiff acquired his water power privilege at the southern end of the dam, and subsequent to the construction of the reservoir by the defendants at

Bow pond, on the northerly side of the river, the defendants purchased certain cotton mills at a point about three miles lower down the river, at which point they constructed another dam for the purpose of supplying their cotton factory with water power, and during low stages of water opened their gates at the dam at Waldron's Falls and allowed the water, which they had penned back in the reservoir at Bow pond, to flow past the dam at Waldron's Falls to the dam at their cotton factory and use the water at the latter point. The action was commenced in 1831. It appeared from the evidence, first, that the defendants and their grantors had for more than fifty years used a portion of the water of the Cocheco river.

(14)

at Waldron's Falls at the northerly side of the dam. It further appeared that in February, 1819. twelve years before the action was commenced, the plaintiff's grantors became seized of a certain mill privilege at the south end of the dam. It further appeared that the reservoir at Bow pond was constructed in 1825, six years *after* plaintiffs' grantors had become seized of the water power privilege at the south end of the dam at Waldron's Falls; and at this time the defendants and their grantors used the water power privilege which they were entitled to at the northerly end of the dam at Waldron's Falls, so that the reservoir, which supplied
6220 the additional water power in seasons of drought, was constructed after the rights of the plaintiff had accrued, and the attempt to use the water thus dammed back at the cotton factory, three miles below Waldron's Falls, was not made until long after the plaintiff or his grantors had acquired their water power privilege. The court held that the defendants had a right to open their gates at Waldron's Falls and to allow the water to which they were entitled, and the water which they had supplied to the stream by means of the reservoir at Bow pond, to flow down past the dam at Waldron's Falls to their cotton factory three miles below; provided, of course, that they use no greater quantity than they would have used but for such change in the location of the place where the same was used. We can do no better, upon this subject, than to quote from the opinion of the court, page 458:

"The next question rises upon the instruction to the jury, that the defendants might draw through their gates in dry seasons even a larger quantity than they had been accustomed to draw prior to 1828, *if the excess was furnished by themselves by means of a reservoir they had constructed above."*

The court will see that, as the action was commenced in

(15)

1831, no right by prescription existed to this excess of water. It depended entirely upon the legal right of the
6221 defendants to use water which they themselves had provided, and by their own means had added to the waters of the stream. On page 459 the court continues:

"This part of the case depends upon some special circumstances, probably not often existing. The defendants appear to have provided a supply of water at Bow pond, the outlet of which empties into the Cocheco river, for the use of their factories in time of drought. There is no complaint that in making provision for this supply they have infringed any rights; if there was, it could not be tried in this case. In order to use this water at their factories in Dover it must pass Waldron's Falls, and the question is whether the defendants are obliged to shut their gates at that place so that the plaintiff may have the use of the additional water thus provided as it passes those falls, or to use it in part themselves there in order that the plaintiff may use it with them, or whether they may suffer their gates to stand open, *and this additional water to pass without use by any one. On the case before us, the plaintiff has no right to have this water pass Waldron's Falls. The defendants may pen it back and permit it to evaporate without suffering it to come into the Cocheco river.* It is derived from a reservoir provided by them for their own purposes, and the plaintiff can maintain no action
6222 for depriving him of the use of it in that mode. On what principle, then, is his right infringed if they let the water into the river, hoisting their gates at Waldron's Falls and permitting it to pass by? On what ground are they obliged to pen it up there for the plaintiff's benefit? Suppose, instead of a mill the plaintiff was the

owner of a meadow lying upon the Cocheco above Waldron's Falls, which in or-

(16)

dinary stages of water, in the summer, prior to the construction of the reservoir at Bow pond, had not been affected by the water, and that if the defendants were now to let the water out of the reservoir in the summer and pen it up by the dam at Waldron's Fall until they had occasion to use it for their works there, the plaintiff's meadow would be overflowed thereby and injured, he would most clearly have a right to complain of that, and his complaint would be in substance that the defendants did not open their gates and let the water pass, but by means of their dam they threw the water back upon his land. This may serve to show that he cannot object to the act of the defendants in drawing the water through their gates, unless he can show a right to the use of it and a duty upon the part of the defendants not to deprive him of that use. As the owner of a mill site on the river, *he would have been entitled to the use of it from the mere fact that it run in the channel,* HAD NOT THE DEFENDANTS PROVIDED IT AND TURNED IT INTO THE RIVER
6223 FOR THEIR OWN USE."

And, again, page 461:

"We have considered this case as if Watson & Son (the plaintiff's grantors), when they conveyed in 1819, could grant the right to use the southerly end of the dam all the water ordinarily running in the stream beyond the quantity which the defendants and those under whom they claim had been accustomed to use on the northerly side."

So the court will see that this case is directly in point and fully sustains the claim we make. It did not turn upon the fact that the defendants had by use acquired a right to the water in the stream to the exclusion of the plaintiff, but the plaintiff was treated as being entitled to a portion of the

(17)

water running in the stream for his mill site at the southerly end of the dam at Waldron's Falls, and it is expressly held that he has no right to complain of diversion of water from this stream, and a refusal to permit it to pass over the dam at Waldron's Falls *in case such water has been supplied by the defendants.*

The case of *Society for Manufacturing* v. *Morris Canal Co.*, Saxton (N. J. Ch.), 157, is so nearly identical in all particulars with the case at bar that we feel justified in quoting therefrom more fully than in our former brief. We desire here to say there is nothing in *that* case, as claimed by appellee's counsel in Appellate Court,
6224 from which it can be inferred that the Canal Company used the Rockaway as a part of their canal the *whole* distance from the points at which the waters of Lake Hopatcung and Green pond were brought into the Rockaway to the point where the same was withdrawn for canal purposes. As these points were necessarily distant from each other, the *probabilities* are that the water from either one or the other, or perhaps both of these sources, was introduced into the Rockaway at a point where the Rockaway itself was *not* used as a part of the canal, but we apprehend on principle it can make no difference how this fact is, *the important inquiry is, were such waters introduced by the* SAME PERSON *who, for his own purposes* (*at a point where he had control of the stream*) *withdrew the same; and if so, had such person the right to withdraw from the stream as much as he had added thereto?*

The chancellor says, p. 188:

"I now propose to consider the right of the defendants, or how far, if at all, they interfere with those of the complainants; and whether, in the exercise of those rights any injury has been done to the

(18)

plaintiffs, and whether, in the further use of them, the plaintiffs will be so *certainly* and *permanently* injured as to justify the interference of the court at this time by injunction.

6225 "And first as to the rights claimed by the defendants; I do not understand them as claiming a right to the *ad libitum* or unrestrained use of the water of the Passaic or its tributaries, subject to the payment of a compensation or damages to the society for establishing useful manufactures. * * *

"They claim, under the act of incorporation, the right to construct a navigable canal from the Delaware to the Passaic; *they claim the use of the waters of Lake Hopatcung and of the extra water of Green pond; they claim to bring the water from the Hopatcung into the Rock-*

away to make use of that river as part of the canal, and to take out of it again water for the use of the canal— NOT THEREBY DIMINISHING THE ORDINARY AND NATURAL FLOW OF THE WATER AT THE GREAT FALLS OF PATERSON.

"It does not follow that because a person as riparian proprietor has a right to the flow of a stream and to its use for the purpose of manufacturing or any other purpose requiring the use of water, that therefore no other proprietor or person shall be at liberty to use, for the same or like objects, the water above him. This would be contrary to natural justice and the reason of things. Each one has a right to the use, provided that in the exercise of such right he does no injury to his neighbor. 2 Blac. Com., 403.

6226 "Now if the Morris Canal and Banking Company make *such use of the waters of the Passaic, or any of its tributaries, as to occasion no* DIMINUTION *in the flow of the stream at the place*

(19)

where it is used by the complainants; and if in such use no injury whatever is done to the complainants, are they not exercising an ordinary and well established right? Does not the same privilege that is accorded to others also belong to them? It appears to me unquestionable that the *defendants have such right* as against the complainants, subject to the condition already stated.

"But the Morris Canal Company *claim the further privilege of introducing* into the Rockaway the waters of the Lake Hopatcung, and of one of the branches of the Raritan, and then of taking out of the Rockaway below so much water as may be necessary for the purposes of their canal; *averring that the waters of the stream will be thereby in no wise diminished.*

"The water thus taken out, it is admitted, is not to be returned until it shall have passed the great falls at Paterson. They say that the supply of water thus brought in, together with the extra supply which they are authorized to take from Green pond, will in times of drought afford the society *a more copious flow* than they would otherwise have, and therefore that it will be a benefit. On the other hand it is contended by the society that
6227 the Canal Company have no authority thus to commingle different streams and different rights; that they are entitled to the flow of the *identical* stream of water,

not only without *diminution* but without *alteration;* that if the claims of the company in this behalf are sustained, the supply afforded by these substituted streams may in time diminish, and the property and immunities of the company be jeopardized or ruined.

"This is *supposed* to present a question of *novelty* and *importance.* It certainly is *not* the case of a *simple diversion*

(20)

of the stream for necessary purposes, returning it again to its natural channel when those purposes shall have been answered; but would seem to be rather a *substitution of part of one stream for part of another.* The principle that assigns, to everything capable of ownership a legal and determinate owner, is wise and salutary and productive of great ends of civil society. This principle, however, can only be applied to streams of water in a limited sense. *There is no such thing as actual property in running water.* It is transient in its nature and must be permitted to flow for the common benefit. The interest is rather of a *usufructory* kind, but not the less absolute or vested on that account.

"To say, then, that a person entitled to the flow of a
6228 stream through his land, is entitled to the flow of the *very identical substance* that issued from the original source, is an assertion of right not easily sustained. *It would be tantamount to the ownership of the particular water itself, which cannot be.* I do not understand Lord Ellenborough, in *Bealy* v. *Shaw,* to carry the doctrine thus far. His principle is, that every man has a right to the advantage of a flow of water in his own land, *without having its* QUANTITY *diminished, or its* QUALITY *altered by the operations of those who might be above him on the same stream. It is not* pretended that the QUALITY of the water to be let in from Lake Hopatcung and other sources is in any way different from the water of the Rockaway. IF THEN THE DEFENDANTS TAKE FROM THE ROCKAWAY NO GREATER QUANTITY OF WATER THAN THEY BRING IN, (and they claim a right to do no more,) WILL NOT THE SOCIETY ENJOY THEIR PRIVILEGE WITHOUT DIMINUTION OR ALTERATION, OR CAN THEY IN ANY WAY BE INJURED?"

(21)

This case, as the court will see, was decided upon the

exact principle we contend for. It did *not* turn upon the fact that the Rockaway was used as a part of the canal the entire distance from the point where the water was introduced to the point where it was withdrawn. Indeed, there is nothing in the case to indicate that the *bed of the stream* was used as a canal at all, but the indica-
6229 tions are that the sense in which the court speaks of the claim made by the Canal Company to the use of that stream as a part of the canal, *is its use as a feeder,* for in reading the statement of the case and the extended and able argument of the counsel, it will be found that it is *nowhere* stated that the bed of the stream was used *as a part of the bed of the canal.* On the contrary, Mr. Wood, of counsel for the Society, claimed, p. 167, that the Canal Company could have accomplished their purposes and avoided all trouble *by passing the water from Lake Hopatcung and other sources over the Rockaway in an aqueduct,* and this claim seems to have been acquiesced in by all the counsel on both sides.

The California cases already referred to establish the right of the Canal Commissioners to the surplus water turned into the Desplaines from Lake Michigan as clearly and conclusively as it is possible for that right to be established by the uniform decisions of any one court. The opinions of this court have always ranked high with the profession, and one of them was rendered by Mr. Justice Field, now of the Supreme Court of the United States, whose reputation as a learned jurist is second to none, and it would seem upon principle that as a riparian proprietor is *only entitled to the water that naturally runs in the stream,* that he has no right
6230 to complain if an upper proprietor takes from the stream a like or less quantity than that which he has added thereto.

(22)

The same question has been since repeatedly reaffirmed by the Supreme Court of California.

III.

The State of Illinois by making the deep cut at the summit level has caused the waters of Lake Michigan to flow directly through that deep cut into the canal. This water, as the act shows, was brought from Lake

Michigan in pursuance of the original plan for the construction of the canal, and one of such purposes always has been to supply water for manufacturing purposes in case a surplus of water is found in the canal for that purpose; and all of the acts of the Legislature recognize this fact and impose upon the Canal Commissioners, and have for all time, the duty of realizing as large a revenue as possible from this source for the purpose of keeping up and maintaining the canal. This water from Lake Michigan is turned into the canal and into the Desplaines river by artificial means, and is, at least until it arrives at Lockport, an artificial water course, entirely within the control of the Canal Commissioners, subject to be by them diverted in such a manner as the law may authorize, or as they shall deem best for the interests of the State, and for such diversion, no matter
6231 whether made for the purposes of supplying the canal with water or for the purpose of furnishing power for manufacturing purposes, the appellee has no right to complain, and would have no such right if the Canal Commissioners should by an artificial channel receive the water at the place where it is discharged through the Norton mill-race, and conduct the same in an artificial channel to the canal, or to the point where the river and canal are united.

(23)

We don't understand that appellee's counsel insist that in such case they would have any right to complain. In other words, they concede the right of the Canal Commissioners to divert this surplus water from Lake Michigan at any point BEFORE it reaches the Desplaines River, but insist that it cannot be diverted after it has reached the bed of that stream. We can see no difference in principle between the diversion *before* and a diversion *after* the waters have reached the Desplaines River, provided always this diversion is made before the artificial waters thus commingled with the natural waters of the stream came into possession of appellee. This artificial water is added to the stream, not for the benefit of appellee, but for the benefit of the canal and for canal purposes. They were withdrawn from the stream by the same party that supplied the same and for legitimate purpose. It has even been held that the right of prescription cannot be asserted in favor of the use of

6232 such water, but that the original proprietor may alter the course at any time to suit his pleasure, even after a period of twenty years.

Greatrex v. *Hayward,* 8th Exc. (W. H. & G.), p. 292.
Wood v. *Waud,* 3 Exc., 748.
Washburn on Easements, X, pp. 294-6.
Arkwright v. *Gill,* 5 Mees. & W., 203.
Greatrex v. *Hayward,* 8 Exc. (W. H. & G.), p. 290.
Wood v. *Waud,* 3 Exch., 748.
Angell on Water Courses (6 Ed.), Sec. 206.

But the upper proprietor may acquire an easement to the flow of an artificial stream over the lands of a lower proprietor, and this, too, although the lower proprietors has no right to demand that the artificial water course should be maintained.

Angell on Water Courses (6 Ed.), 206A.

(24)

Rawstron v. *Taylor,* 11 Exch., 378.
Broadbent v. *Ramsbotham,* id., 610.
Solomon v. *Vintner Co.,* 4 H. & N., 593.
Sampson v. *Hoddinott,* 1 C. B. N. S., 590, 606.

In such case the upper proprietor would not be liable for a diversion of the water formerly running in the artificial water course.

Rawstron v. *Taylor, supra,* which is a leading and important case on this subject.

6233 Counsel for appellee in the Appellate Court seemed to rely upon the case of *Wood* v. *Waud,* 3 Exch., 748, as establishing their right to the water added to the Desplaines River from Lake Michigan through the deep cut in the canal.

This book is not to be found in the library, but a full report of the case will be found in Washburne on Easements and Servitudes (2d Ed.), p. 370, star p. 297, from which we cite as follows:

"In *Wood* v. *Waud,* 3 Exch., 748, the plaintiff and defendant each had mills upon a small natural stream. A part of the supply of water for these was derived from two different mines, from one of which a stream had flowed for sixty years by means of an artificial outlet dug by the owner of the mine for the purpose of draining his mine. From the other mine a stream of water flowed which was caused by pumping. These streams flowed through separate sloughs into the natural stream.

One of these passed underground through the defendant's land before reaching the plaintiff's land, and then through that into the stream. The other did not pass through the plaintiff's land at all before reaching and discharging itself into the stream.

The action of the plaintiff was for diverting, or im-

(25)

properly interfering, by the defendant, with the enjoyment by the plaintiff of water flowing from these sloughs. Whatever he did in this respect was done upon his own
6234 land, before they had entered and united with the waters of the natural stream, and before the water of the slough that run through the plaintiff's land had reached the latter.

The court held that if the mine owner had seen fit to stop the supply of water, or divert it, so that the water from the mines should no longer reach the works of the mill owners, he would not have been liable therefor, adopting the doctrine of *Arkwright* v. *Gell*. As between the plaintiff and defendant no prescription had been set up or relied on on either side, neither had any right to complain of any use which the other should make of the water on his own land, before it reached that of the other, provided he did not foul it or turn it into the stream heated so as to injure the party below. 'Each,' in the language of the court, 'may take and use what passes through his land, and the proprietor below has no right to any part of that water until it has reached his own land. He has no right to compel the owners above to permit the water to flow through their land for his benefit, and consequently has no right to action if they refuse to do so. * * * If they polluted the water so as to be injurious to the tenant below the case would be different.' But as soon as the water from either of these sloughs had become united with that of the natural stream in its natural water course it par-
6235 took of the character and incidents of a natural stream. Pollock, C. B., in giving the opinion of the court in the above case, gives, as an illustration of the doctrine which he sustains, the case of a drain made through a man's land for agricultural purposes, which

(26)

had continued for twenty years, whereby the water from his own land was discharged upon that of another. This

would not give a right to the latter to insist upon its continuance and thereby to preclude the land owner from altering the level of his drain for the greater improvement of the land. The state of the circumstances in such cases shows that one party never intended to give nor the other to enjoy the use of the stream as a matter of *right.*"

"The above makes this important distinction between the right of the lower riparian proprietor to water flowing in a natural stream and to that created and flowing in an artificial one for a temporary purpose, that in the former case an action will lie for its diversion by an upper proprietor, although done on his own land, whereas in the latter case no action will lie for the diversion of the water unless the same shall have reached and become part of a natural stream."

From this it will be seen that the question at issue was
6236 not presented in that case, and so far as it goes it is an authority in our favor.

It establishes conclusively our right at least on our own land, to divert the waters of our artificial water course.

But the artificial waters considered in this case were not contributed by *either Wood or Waud,* but by *another, who was not a party to that suit.* So that while it may be true that as between Wood and Waud *neither* would have had the right to withdraw from a natural stream water, or a like quantity of water, that had been added thereto by *another,* this case does not decide that if *either* had added artificially to the waters of a stream that he might not, on his own premises, withdraw a like quantity.

If, in that case, artificial water had been added to the nat-

ural stream by means of an artificial channel by the defendant for his own purposes, and for his own use withdrawn from the natural stream before it reached the possession of the plaintiff, and, if, under such circumstances, the court had held that he had no right so to do, the case might support the position assumed by appellee; but as it is it falls far short of so doing. The most that can be claimed on the strength of that case is that the defendant would not have the right of withdrawing,

to the prejudice of the plaintiff, water that had been
6237 supplied to the natural stream by a stranger to him, neither at his request nor through his agency; that is, the stranger who thus added to the waters of the stream by artificial means, not seeking to withdraw it for its own use, had abandoned it for the use of the several riparian proprietors, and for that reason the several riparian proprietors were interested therein to the same extent as if supplied from natural sources, the stranger, however, being at liberty to divert the artificial stream at any time. It was his water, and he had a right to permit it to flow into the natural stream, or elsewhere, as he saw fit.

IV.

Appellee claimed in the court below that no water had been added to the River Desplaines by appellant or those from whom he claims; that the water which was added was by virtue of the improvement of the summit division of the canal; that the purpose of this improvement was *not* to supply water to the canal, etc.; and in support of the position thus assumed, counsel cited *a portion and a portion only* of the preamble of the Act of 1865, under which the deep cut was made.

(28)

The portion cited read as follows, viz.: "Whereas, it has been represented that the City of Chicago, in order
6238 to purify or cleanse Chicago River by draining a sufficient quantity of water from Lake Michigan directly through it and through the summit division of the Illinois and Michigan Canal, would advance a sufficient sum of money to accomplish this desirable object." Here ends the quotation, and counsel in commenting on it say this showed the object of the act to be to purify the Chicago River and to accomplish *this end* water was to be drawn through the summit division of the canal.

It is evident the Appellate Court did *not* read the act or the preamble thereto, but took it for granted the quotation was the *whole* of the preamble, and hence was led into error as to the true object of the passage of that act.

If the *sole* object of making the deep cut was to drain Chicago River, there would be some force in the position taken; but even then, if the water was resumed

before it passed to the point where appellee was entitled to use the same, no action would lie therefor. But it is hardly necessary to discuss that question, as a perusal of the whole preamble and the act itself shows that the object of making this deep cut was to supply the *canal itself with water from Lake Michigan.*

The *whole preamble* is as follows:

"Whereas, it has been represented that the City of Chicago, in order to purify or cleanse Chicago River by
6239 drawing a sufficient quantity of water from Lake Michigan directly through it and through the summit division of the Illinois and Michigan Canal, would advance a sufficient amount of funds to accomplish this desirable object; *and whereas, the original plan of said canal was to cut down the summit so as to draw a supply of water*

(29)

for navigation directly from Lake Michigan, which plan was abandoned, for the time being, after a large part of the work had been executed, ONLY *in consequence of the inability of the state to procure funds for its further prosecution;* and whereas, under the law creating the trust, the plan of the summit division of the canal was changed, the level being raised so as to require the principal supply of water to be obtained through the Calumet feeder, subject to serious contingencies, and by pumping onto the summit with hydraulic works at Bridgeport; now, therefore,

Be it enacted &c. Sec. 1. *That to secure the completion of the summit division of the Illinois and Michigan Canal upon the original deep cut plan, &c.*

Sec. 2. The canal shall be constructed on the plan adopted by the Canal Commissioners in 1836.

Sec. 3. Provides for right of way.

Sec. 4. The amount expended (not exceeding the sum of $2,500,000 and interest) in deepening summit division on the plan adopted by the Canal Commissioners in 1836 shall be a lien upon the canal and its revenues.

6240 Sec. 5. The State may at any time relieve this lien by refunding to the city the amount expended.

The title to this act, as well as the preamble and the act itself, is worthy of consideration, and shows what the *object* of the act was, viz.:

"*An act to provide for the completion of the Illinois*

and Michigan Canal upon the plan adopted by the State in 1836."

In 1871, shortly after the great fire in Chicago (see Session Laws, 1871-2, p. 170), the General Assembly, under provisions of Section 5 of the Act of 1865, refunded this money to the City of Chicago and discharged this lien.

(30)

So it will be seen that the *primary* object for deepening the summit division was obtaining a supply of water *for the canal,* directly from Lake Michigan. To complete the canal ON THE ORIGINAL DEEP CUT PLAN, adopted in 1836, the *secondary* object was to furnish drainage to Chicago. To accomplish the *primary* object the City of Chicago was authorized to *complete the canal on the original deep cut plan,* and was given a *lien* on the canal and its resources for its repayment. The drainage of Chicago was a mere *incident,* a *secondary* consideration.

In this connection and for the purpose of showing more conclusively what was intended by the Act of 1865, authorizing the deep cut on the summit level, it may be
6241 of interest to examine the Act of 1836, providing for the construction of the Illinois and Michigan Canal. (Vide Sess. Laws, 1836, p. 145.)

We quote from Sec. 16 of that act as follows:

"The said canal shall not be less than forty-five feet wide at the surface, thirty feet at the base and of sufficient depth to insure a navigation of at least four feet, to be suitable for ordinary canal boat navigation, TO BE SUPPLIED WITH WATER FROM LAKE MICHIGAN and such other sources as the Canal Commissioners may think proper, &c."

To be supplied with water from Lake Michigan for what purpose? For *navigation* simply? No, for ALL purposes; and one of the purposes *always* contemplated in making such improvements is the supplying of water power when practicable, and thereby aid, from the revenue thus derived, in maintaining, at the least possible expense to the public, these desirable enterprises.

(31)

V.

We desire to consider briefly the opinion of Mr. Justice Pillsbury, of the Appellate Court, as we presume

that opinion will, to some extent, be the basis of the argument that may be made in this court on behalf of appellee.

Justice Pillsbury says (page 11 of abstract) that:

6242 "In construing contracts courts will examine their provisions in the light of the circumstances surrounding the parties, and the subject matter when made."

This is undoubtedly true, and is supported by the authorities cited by us on page 49 of our former brief.

To use the language adopted by Mr. Justice Caton in *Hodden* v. *Shentz*, 15 Ill., at page 582:

"The law must give a common sense construction to grants, and consider the state of things, and the consideration in view of the parties at the time the grant is made which move them to its execution and acceptance."

It becomes, then, for the proper application of this rule, necessary to inquire what the considerations are that were in view of the parties at the time the Havens' release was executed. It is a part of the conceded facts in this case that the Illinois and Michigan Canal was completed and opened for navigation in the spring of the year 1848. (See page 3 of abstract.) So that prior to that time there had been no diversion of the waters of the Desplaines River by the canal authorities. That diversion did not commence until the 20th day of April, 1848.

Canal Trustees v. *Haven*, 5th Gilm., p. 554.

So that of course up that time there can be no claim or pretense that any water was allowed to *spill* from the

6243 summit

(32)

level into the Desplaines River at Lockport. The cases of *Haven* v. *The Canal Trustees*, decided in the 5th of Gilman, was brought to the October Term of the Circuit Court of Will County for the year 1848, and was tried upon an agreed state of facts fully appearing in the opinion, from which, among other things, it appeared (*Canal Trustees* v. *Haven, supra*, p. 554) that

"on the 20th day of April, 1848, the defendants (Canal Trustees) diverted, or caused to be diverted, into the canal for the use of said canal, from the natural channel of the river, the whole or the principal part of the waters of said river by turning the same from the basin in said river by means of a dam on Section 9, being a

canal section, and about half a mile above the dam of said plaintiffs, so that the plaintiffs are wholly deprived of the use of the water at their said mills, and have not since been able to run their machinery. From the time of putting this portion of the canal under contract in 1838, and up to the year 1843, there had been no change in the original plan *of supplying the canal with water from Lake Michigan by the deep cut as originally contemplated,* and all contracts let previous to 1843, and all the arrangements of said canal, were made notoriously upon the plan aforesaid, *and with a view to supply the canal from Lake Michigan."*

6244 In that case the Supreme Court decided that Section 16 was not included in the lands reserved from sale and granted to the State by the Act of 1822; so that the provision of the Legislature reserving a right of way for the canal, did not apply to Section 16, and on the state of facts presented in that case this court held that the Havens were riparian proprietors upon one side of the stream, and as such were entitled to the use of one-half of the natural flow of the stream. (p. 558.) This same case was again taken to the

(33)

Supreme Court of this State upon the assessment of damages, and is reported in the 11th Ill., 554, and the judgment for damages reversed for the reason that they were excessive and that the amount which the Havens were entitled to recover, as the case then stood, was merely *nominal.* The Havens' contract, or lease, which is set forth in this record, was a settlement of this suit, and the preamble to the contract shows that it was intended as a settlement of the matters in controversy in *that* suit and for damages to the Havens occasioned by diverting the waters of said river from their mill and applying it to the use of the Illinois and Michigan Canal above said mill. When we take into consideration the agreed state of facts in the case reported in the 5th Gilman and the reference that is there made to the abandonment of the project for supplying the canal with water from Lake Michigan, and the further consideration that the Havens were then complaining that the

6245 canal was not thus supplied with water, but that on the contrary the trustees were using the natural water of the Desplaines River for that purpose, and the further

consideration that this suit was brought immediately after the opening of the canal, it is evident that the subject matter of that contract was the *natural water* of the Desplaines River, and *not* water that was then or that might any time thereafter *be added thereto from Lake Michigan.* Justice Pillsbury says in his opinion (p. 11 of abstract):

"We think it fairly deducible from the admitted facts, if not stated in so many words, that the hydraulic basin referred to as being at Norton's mills was a part of the original construction of the canal and that before the deepening of the summit level the surplus or waste water from that level was turned into the Desplaines River in the same manner it has been since,

(34)

although in much less quantities."

There is no warrant for this deduction. There is nothing in the admitted facts that directly or indirectly concedes that a drop of water passed from the canal at Lockport into the Desplaines River until the canal and river formed a junction and were united in one stream. There was no *waste water* at Lockport. There could *not* have been from the fact that the summit level was supplied only in part by feeders, and the canal authorities were compelled to and did erect extensive pumping works for the purpose of assisting in supplying that
6246 level with water from the Chicago River at Bridgeport. There is no evidence, therefore, nor any fair inference, that the volume of the water in the river was at the time of the execution of this contract, or the commencement of the suit which this contract settled, increased by the water running in the canal to the slightest extent, except at the point where the canal and river were one; and there could be no inference further from the *true* facts in the case than that drawn by Justice Pillsbury when he says:

"With these facts within the knowledge of the parties and, as we must conclude, taken into consideration by them in adjusting the matters in dispute, it would seem that the trustees treated the right to the exclusive use of the water of the river, increased by their own work, so far as it could be necessary to appropriate it for the purposes of navigation, as a sufficient consideration for the relinquishment upon their part of any claim

to use or divert any portion of the water in the stream, from whatever source derived, not required for such purpose."

The *agreed* state of facts, as appearing in 5th Gilman, upon which the Haven suit was brought (and the Haven contract itself), shows as conclusively and clearly as anything can show that at the time of the execution of the Haven release all idea of making the deep cut *and supplying the canal with water from Lake Michigan had*
6247 *been abandoned*, and the canal authorities were compelled to look elsewhere for their supply of water; and even if a slight quantity of water did escape from the canal into the river at Lockport at this time, the quantity was inconsiderable, and was not taken into account either one way or the other in the execution and acceptance of this release. In fact, it is evident that the Havens never imagined for a moment that they were entitled to any water except that which flowed naturally in the Desplaines River, and the Canal Trustees certainly never imagined for a moment that they were releasing or abandoning their claim to water that might thereafter be added by them from Lake Michigan. So that from the condition of the thing which was the subject matter of this contract and the circumstances surrounding the parties at the time, it is evident that the *only thing* concerning which these parties contracted was the *natural water* of the Desplaines River; and while we doubt not this release can be successfully relied upon as a bar to the claim now made, it certainly would be a strange construction of the release to say that it applied to other and different water than the *natural water* of the Desplaines River or that it applied to waters which, *in the contemplation of the parties at that time, never could become a subject of controversy.*
6248 Again, the language of the release itself confirms us in the position we have taken. The release was executed to settle the suit brought for alleged damages "occasioned by diverting the water of said river," and in consideration of the money received the Havens "released and discharged the trustees from all action, rights of action, and all claims arising out of

any damages heretofore, now or hereafter to be sustained by them *by reason of the use of the waters of the*

Desplaines River for the purpose of supplying said canal in the same manner the same is now supplied at the feeder at Joliet. That is, they released damages on account of the diversion of the *water of the Desplaines River,* but in no manner can it be inferred that they set up any right or claim of right to the *waters of Lake Michigan.* And again, they grant the right to use and appropriate the water of the said Desplaines River at the feeders at Joliet below Guard Lock No. 1, for supplying the said canal for the purposes of navigation *in the same manner the water in said river in connection with other feeders is now used for supplying said canal.* And it is a part of the history of the canal, well known to all citizens at all familiar with its management, that from the opening of the canal in 1848 until the present time it has been one of objects of the canal authorities to supply water power at all points and under all circum-
6249 stances where it was practicable for them to do so; and every act of the Legislature providing for the government of the canal, from the year 1839 to the present time, has made it the duty of the Canal Commissioners or trustees to derive all possible revenue from this source. Again, by applying to this release the well established doctrine that *all grants are to be construed most strongly against the grantor,* a doctrine so thoroughly settled as to be elementary, and we find that under the Havens' release the Canal Commissioners would be entitled to use *all the natural waters of the Desplaines River, so far at least as those claiming under the Havens are concerned, for the purposes of navigation in the canal.* This right continues for all time to come; and if you limit the grant to the use of such waters

to the purposes of navigation alone, still applying the above rule, it could *only apply to the natural waters of the river. Nothing else being in contemplation of the party at the time, leaving, therefore, the Canal Commissioners at full liberty to withdraw from the Desplaines River for the purpose of supplying water power privileges all the water which they had added thereto from Lake Michigan or other sources, provided always that the natural waters of the river afforded them a sufficient supply for the purposes of navigation,* as it is, by the improvement of the state, appellee has been greatly

benefited and his water power largely increased. In
6250 what manner, therefore, can it be said that he has sustained damage? It seems to us clear that the effect given by Justice Pillsbury is unwarranted by the facts, and is in direct conflict with the rule that he himself lays down.

Again on page 14 of the abstract, Justice Pillsbury says:

"From the admitted facts, and from the circumstances surrounding the making of the improvement, or deep cut so-called, the conclusion is rendered certain that the said improvement was *not* made for the purpose of supplying the canal below Guard Lock No. 1 with water for canal purposes, but for the purpose *alone* of improving the drainage facilities of the City of Chicago by making the canal an outlet for its sewers by way of the Desplaines River. All the facts and circumstances negative the idea that it was a part of the plan of the city in making such deep cut, or of the State in allowing the city to do so, to create a water power on the Channahon level, *or to furnish water for canal purposes.*"

It is impossible to believe that the learned judge who wrote this opinion had had his attention called to the act

(38)

of 1836 providing for the construction of the canal, for if he had he would have seen that it was originally contemplated that so far as possible the canal should be supplied from one end to the other with water from Lake Michigan. The original plan of the canal contemplated the use of that water and relied upon Lake Michigan
6251 as the principal source of supply. It is also very evident that the learned judge failed to read the act of 1865, under which the deep cut was constructed, for the title of that act would have disclosed to him his error. It is also very evident that the learned judge supposed that the counsel for the appellee had quoted in their brief in this court the whole of the preamble to the act of 1865, and that he accepted the conclusions to which counsel for appellee had arrived as to the object of this deep cut, without a careful examination of the act itself; for, if the act of 1836 and the title to the act of 1865, *the preamble thereto,* and the act itself, are considered together (and it is necessary to thus consider them in

order to arrive at the legislative intent), it is as clear as the noonday sun in an unclouded sky that the object of the Legislature in causing this work to be done was to supply the canal with water from Lake Michigan, and to supply it for the use of the canal for all legitimate purposes, such as navigation of the canal itself, and the furnishing when practicable of water power along the route of the canal. The State did this work, and not the City of Chicago. It is true that the City of Chicago acted as the agent of the State in so doing. The City of
6252 Chicago had an object to accomplish in which the State had no interest; but being an object of public importance, the State facilitated its accomplishment by allowing the city to advance the necessary funds to complete what the State had already planned,

(39)

giving the city a lien, which lien was subsequently discharged by the State. The State never for one moment surrendered the control of the canal. The State never had in allowing this work to be done any other object in view than the deepening of the canal itself, and the act under which the work was done provided that the City of Chicago should be reimbursed, either from the revenues of the canal or from the treasury of the State. And if the learned judge was in possession of all these facts at the time of penning the quotation last above made, the conclusion arrived at is unaccountable, and must be a surprise to every one conversant with the facts, as well as to himself on further reflection.

VI.

We desire to suggest in closing that the Appellate Court had no jurisdiction to hear or determine this case.

Sec. 88 of the Practice Act, Sess. Laws 1879, p. 222, provides that "All cases relating to revenue, or in which the State is interested *as a party or otherwise*, shall be taken directly to the Supreme Court."

6253 In the case at bar the State is *directly* interested, not as a party, it is true, but in the result. If this judgment is collected the State would be both legally and morally bound to refund the money to the appellant. And then again, if the judgment of the Appellate Court

is affirmed, all revenue to the State from this source will be lost.

Respectfully submitted,
G. D. A. PARKS,
E. F. BULL,
For Appellant.

5260 Counsel for defendant read in evidence the report of the United States Chief Engineer, 1901, Part 5, statements in regard to the Snake river, from pages 3529 to 3542, as follows:

"DESCRIPTION:—The Snake river is a long and very crooked mountain stream flowing from upward of 900 miles down the western slope of the Rocky Mountains. It si extremely irregular in its direction of flow, width, depth, and slope, as well as in its banks and bed. Portions of it are inclosed in steep, rocky canyons where the great slope causes extreme velocities, portions of it include waterfalls and cascades of great beauty, but only in its lower portions are reaches found where navigation is practicable. It rises in the mountains in the southern part of Yellowstone Park, flows southwest through the southeastern part of Idaho until within about 60 miles of the Great Salt Lake of Utah, and then flows westward through southern Idaho. It then turns north and forms for 200 miles the boundary between the States of Idaho and Oregon. At Lewiston, Idaho, where it receives the waters of the Clearwater River, it again flows westward and finally empties into the Columbia River in the State of Washington near the town of Ainsworth. It is subject each summer to very high rises, varying from 18 to 26 feet, due to melting of snow in the mountains, and remains in a state of flood for several months,
5261 usually commencing early in May and lasting until September. There is also usually an autumn rise in November varying from 4 to 10 feet, due to rains in the areas drained. The low water discharge of the Snake at its mouth in the Columbia River is reported to be 26,000 cubic feet per second. (See Annual Report of the Chief of Engineers for 1889, p. 2583.)

The basin drained by the Snake River and its branches comprises the greater part of southern Idaho, large parts of eastern Oregon and southern Washington, and parts of Utah, Wyoming and Nevada. This area is esti-

mated to be 104,000 square miles. (See House Doc. No. 411, Fifty-fifth Congress, Second Session.)

Geologists state that the greater part of all this area has in former geological periods been subject to successive overflows of volcanic lava that now form the basaltic cliffs and mountains found in general over all this region. The river banks are, therefore, rocky and not easily washed, so that the Snake is not what may be properly termed a sediment-bearing stream. Considerable sand and gravel are carried, however, due mainly to the disintegration and wearing away of the rock and boulders forming its banks and bottom. The bottom also is mainly rock and boulders except where the sand and gravel have collected, due to natural causes, thus forming bars and shoals. In its upper portions it is
5262 said to be a typical mountain stream, having a rocky bed and swift currents with many picturesque falls and cascades. Above Huntington, Oreg., it does not appear that any special attempt at navigation has ever been made, probably because impracticable. Below Huntington, which is the western terminus of the Oregon Short Line Railroad, and the eastern terminus of the rail lines of the Oregon Railroad and Navigation Company, there is a reach of about 50 miles where an effort was once made at navigation many years ago, in the endeavor to afford water transportation from the Seven Devils mining regions to Huntington.

The Government spent a considerable sum of money from 1891 to 1896 in improving Snake river in the vicinity of Huntington. This was of no avail, however, as the only boat ever built for this section of the river, the Norma, gave up trying to run, after one trip, on account of the lack of paying business and the difficulties of navigation. Lower down from near Ballards Landing, just below Pine Creek, and as far down as the mouth of the Salmon river, the Snake flows in a deep, narrow canyon of basaltic rock for about 75 miles, where the slope of the river surface, sharp bends, and high irregular banks cause high velocities and cross currents and offer a serious obstruction to navigation that will always be formidable and dangerous, if not wholly unnavigable.
5263 From the mouth of the Salmon river down to the mouth of the Grande Ronde river the difficulties of navigation are somewhat less serious, but still probably render the

river impossible for practicable navigation. The mouth of the Grande Ronde river may be taken as the present head of practicable high water navigation in the Snake. The lower 139 miles, however, from the mouth at Ainsworth, Wash., up as far as Lewiston, is the only part that has been successfully navigated at lower stages.

In former days, before the construction of the railroads, this lower section of the river, in connection with the Columbia river, formed the only quick and safe means of communication with Portland, Oreg., and the Pacific coast, where were located the commercial centers. Light-draft river boats plied from Portland as early as 1858 up the Willamette and Columbia Rivers 45 miles to the obstruction at 'The Cascades,' where a portage railway 6 miles long, at the Washington shore, passed the freight and passengers around these obstructions. For about 45 miles more steamers were operated in what was then called the middle Columbia river, or up to the town of The Dalles, Oreg., and there a second portage road, 13 miles long, on the Oregon shore, enabled freight and passengers to pass the obstruction between The Dalles and Celilo, Oreg., and be transferred to steamers on the 'upper river,' above Celilo. These latter steamers at most favorable stages, and usually for more than half of each year, could ascend
5264 from Celilo up the Columbia to the mouth of the Snake, and up the Snake to Lewiston, which latter place thus became at an early date a center of distribution for a large outlying fertile region. The opening of the locks at 'The Cascades' in 1896, by the Government enabled steamboats to pass around one of the worst obstructions in the Columbia river, leaving the obstructions in the 12 miles between The Dalles and Celilo the only impassable ones to be overcome artificially in reaching Lewiston by water from Portland.

The completion of the Portland-Spokane line of the Oregon Railroad and Navigation Company's Railroad, in 1887, along and adjacent to the Columbia and Snake rivers as far as Riparia, Wash., robbed those two waterways of much of their old-time importance, so that all river navigation and portages on the Columbia above The Dalles and on the Snake were practically abandoned in 1888, except on the 73 miles of the Snake between Riparia, Wash., and Lewiston, Idaho. Between these

two points regular navigation has been maintained by the steamers of the Oregon Railroad and Navigation Company up to the present time, and occasional trips are also made by boats belonging to the Northern Pacific Railway Company and others. Occasional trips on the upper Snake have been made as far as the Grande Ronde river, about 25 miles above Lewiston, when the
5265 stage of water was favorable, but these trips are now so few and unimportant that the condition already existing, especially at boating stages, is believed to be sufficient for all the present needs of commerce. The proposed improvement by the Government of the Columbia river between The Dalles and Celilo will, if undertaken and finished, likely revive some of the old-time importance of the Snake river, especially from Lewiston down to its mouth, providing, as it would, an all-water transportation route during at least a portion of each year from Lewiston to Portland.

A survey of the lower 66 miles of the Snake river from Riparia down to the mouth, made in 1899 under direction of Capt. Harry Taylor, Corps of Engineers (report of survey printed in House Doc. No. 411, Fifty-fifth Congress, second session), renders a further survey of this portion unnecessary at this time, so that the portion from Riparia to Lewiston being the only portion now regularly used by vessels, the subject of this survey and report, is the only remaining part believed to be worthy of consideration at the present time in connection with the improvement of the river for navigation.

In the portion from Lewiston to Riparia (73.5 miles), recently surveyed, the average width is approximately, 750 feet, the discharge 22,000 feet per second, the total fall 196.6 feet, and the slope an average of 2.67 feet per mile.

5266 The low-water depth varies from 2½ feet to 25 feet, with an average channel depth of about 8 feet, and the velocity from 1.3 to 8.8 miles per hour. The banks are about 1,500 feet high and usually slope to the water's edge. In a few places, however, there are found narrow and fertile 'bottoms,' limited in area, usually lying at the mouths of small creeks. These 'bottoms' are the only cultivated lands immediately adjacent to the river, but these when irrigated are very fertile and yield luxuri-

antly a fine quality of fruit, berries, etc., considerable quantities of which are shipped out annually.

The river banks slope back to a height of many hundreds of feet, and the bunch grass found thereon offers a sparse but fairly good grazing for sheep and cattle. On high plateaus, some miles back from the river, are the richly productive wheat fields of eastern Washington and Oregon. Much of the wheat, now amounting to many millions of bushels annually, raised in the Camas, and Clearwater basins, Palouse and Big Bend countries, and the Wallawalla and Wallowa regions now passes down the Snake and Columbia River Valleys by rail. For a further description of the Snake river, including description of the rapids and bars and the work done in past years, attention is respectfully invited to Annual Reports of Chief of Engineers for 1877, page 1037; for 1889, page 2583, and for 1891, page 3218.

5267 PREVIOUS IMPROVEMENT.—The Upper Columbia and Snake rivers having formed one of the most important highways of travel in the region in early days before the railroads were completed, Congress, as early as 1872 made appropriations for the improvement of the Columbia, and in 1876 the Snake was added to the plan of improvement. From that time up to the present a total of $288,500 has been appropriated for both rivers, of which, as near as can be learned from the records, $117,850.57 have been applied to the Snake river from Lewiston down to its mouth, mainly below Riparia. The original project was to secure a depth of 4½ feet at low water from the mouth up to Lewiston. The greater part of this improvement was made below Riparia, as the dangers and difficulties met with by steamboats were greatest there. The method of improvement consisted mainly in blasting out obstructing boulders, removing dangerous ledges, scraping sand and gravel bars, and the construction of dikes to concentrate the river flow in selected channels. This work on the lower Snake below Riparia was stopped in 1888, as the steamboats had abandoned that section upon completion of the railways paralleling it, and the expenditures since then being small have all been devoted to improving the portion in actual use between Riparia and Lewiston.

In 1892 $20,000 and in 1894 $25,000 were, as before re-
5268 ferred to, appropriated for the improvement of the

Snake and Huntington bridge down to the Seven Devils mining district. Considerable work was done in freeing the river from obstructions in this locality. Considerable plant was collected, including drill scows, tools, etc., and the work of removing ledge rock and boulders was carried on for several seasons. Only one steamer, the Norma, was ever built for navigating this section of river, and she made but one trip, and then the owners abandoned the idea of running. In 1896 all the Government plant in this portion of the river was sold and the river improvement abandoned.

Before the improvement of the Lower Snake was commenced there were many shoal places where there was not over 2 feet depth at low water. At many rapids the channel besides being shoal, was rocky and thickly studded with outstanding boulders, and was very crooked and intricate. The current was very swift at places, and the early attempts at navigation were accordingly attended with frequent delays, much risk, and occasional loss. The effect of the improvement has been to remove ledge rocks from many places below Riparia, partially straightening the channel, and freeing the river of many obstructing points. Many boulders have been blasted, and sand and gravel bars scraped, both above and below
5269 Riparia. At several places considerable benefit has been obtained by the construction of dikes, closing undesirable channels and directing the river flow into selected places to occasion scour and increase the depths.

Above Riparia the present condition meets fairly well the present demands of navigation at all stages except at and near extreme low water. Extreme low water is seldom reached and only occasionally are boats prevented from using the river for this reason, and then for only short periods. Much delay is experienced near low-water stages, however, by having to 'line' the boats over bars and by having to run with only partial loads.

Previous Examinations and Surveys.—An examination of the Upper Columbia and Snake rivers was made in 1866 by Lieut. (now Lieut. Col.) W. H. Hener, Corps of Engineers, and an estimate of cost of improvement made (see Annual Report, Chief of Engineers, 1866, Part IV, p. 330), amounting to $166,686, with $6,000 annually for dredging. In 1877 a further examination, with estimate of cost of improvement, amounting to $132,000,

was made by Maj. (now Brig. Gen.) John M. Wilson, Corps of Engineers. No continuous survey of the Columbia and Snake rivers has ever been made up to the present day. The plans of improvement proposed in these prospects were for the benefit of the special places found most troublesome by steamboats, and only special, limited surveys of the localities to be improved were made.

5270 In 1897 a survey from Riparia to the mouth was made under direction of Capt. Harry Taylor, Corps of Engineers, and a project and estimate of cost submitted under date of January 27, 1898 (House Doc. No. 411, Fifty-fifth Congress, second session). The project of improvement as stated in this report was for securing at low water at least navigable depth of 5 feet everywhere from Riparia down to the mouth, a distance of 66 miles. The cost was estimated at $165,000, with $3,000 every two years for maintenance.

PRESENT SURVEY.—The present survey was commenced July 28, 1900, and the field work was completed September 24, 1900. The party, numbering 15, was under charge of Mr. Frank Gilham and was composed of a transit party and a level party, with the necessary boatmen, cook, and laborers. The party, using four batteaux, commenced at Lewiston and drifted downstream from time to time with the current when it was necessary to change camp sites. A line of levels, checked by a duplicate set of readings, was carried through the entire distance, the zero being the level of mean low water at the sea, assuming as correct the corresponding elevation of law water at Lewiston (708.6) as observed by the Oregon Railroad and Navigation Company.

Low-water level was obtained from the zero of the gauge at Lewiston on the Oregon Railroad and Navigation Company's waterhouse and from that of the gauge on the central pier of the drawspan of the Riparia Railway bridge. These gauges were read daily at noon during the survey, and were found to indicate fairly well the corresponding stages of water at the two places. These gauges were put in place by the railway companies and have been read for many years by them. The zeros give the best information available of the level of extreme low water.

5271

5272 Present condition and improvement proposed. The description of the shoals, rapids, and other obstructed places between Riparia and Lewiston, where trouble in navigation is experienced at the present time, is as follows:

5274 DETAILED DESCRIPTION OF SHOAL RAPIDS AND PROMINENT POINTS IN SNAKE RIVER FROM LEWISTON, IDAHO, TO RIPARIA, WASH.

Beginning of the survey is 0.25 miles above Oregon Railroad and Navigation Company's warehouse at Lewiston, Idaho.

LEWISTON, a city of about 5,000 inhabitants, is situated at the confluence of the Snake and Clearwater rivers, on the right bank of the former and left bank of latter.

1. LEWISTON RAPIDS:—This rapids is opposite Lewiston. It has a length of 0.57 of a mile and a fall of 4.1 feet, or at the rate of 7.19 feet per mile. The river just above the rapid has a low-water width of about 900 feet, narrowing down, with an almost square-shouldered gravel bar on the right, to a width of 230 feet. The gravel bar has a height of about 5 feet above low water, and width of about 900 feet. On the left bank of the river is a gravel bluff about 40 feet high. This sudden narrowing of the river, together with a shoal place extending across the river just above the head of the rapids, causes a current of 7.93 miles per hour. The least depth of water is 7 feet. No improvement is deemed necessary at this place, as the only difficulty experienced now is caused by the strong current.

The Clearwater river empties into the Snake from the
5275 northeast, 0.60 miles below Lewiston. It has a low-water width of about 350 feet and a depth of about 7 feet. It is the only stream of any importance emptying into the Snake river between Lewiston and Riparia.

2. RIFFLE No. 1 (1.71 miles below Lewiston).—It is 0.20 of a mile in length and has a fall of 15 feet, or at the rate of 7.5 feet per mile, and at least depth of water of 10 feet. No special impediment to navigation was found here and no improvement is necessary.

3. DEAD MARCH (3.2 miles below Lewiston).—It has a length of 0.76 of a mile and a fall of 7.3 feet, or at the rate of 9.3 feet per mile. The least depth of water found was 4 feet. The river, which above the rapid is about 900 feet wide, is here divided by an island, which throws the main body of water into a channel on the south side about 450 feet wide. This sudden narrowing produces a current of 6 miles per hour. The other channel to the

north of the island is about 150 feet wide, and 1.2 feet deep and is blocked by shoals and boulders and not available for navigation at low stages. No special difficulty is experienced here now, but to secure a 5-foot channel it will be necessary to dredge near the lower end.

4. Dry Gulch Shoal.—This shoal is just above Dry Gulch Rapid and 4.45 miles below Lewiston. The river at this point makes a turn to the left and a tongue-shaped
5276 point reaches out from the left bank terminating in a shoal which extends across the river. The deepest water found on this shoal was 2.5 feet. It is proposed to dredge a channel 5 feet deep and 120 feet wide through this shoal.

5. Dry Gulch Rapid (4.66 miles below Lewiston).—It has a length of 0.10 of a mile and a fall of 3.4 feet, giving a rate of fall of 34 feet per mile, and a current of 8.8 miles per hour. A depth of 8 feet was found at the shoalest place. The swift water is caused by insufficient cross section, the river narrowing from 800 feet to 230 feet between a low gravel bar on the right bank, about 500 feet wide and 2 feet deep above low water, and a low rocky bluff on the left. The only impediment to navigation is the strong current. No improvement is proposed.

Alpowa (9.4 miles below Lewiston).—A small settlement on the left bank of the river at the mouth of Alpowa Creek. A current ferry is maintained at this point.

6. Alpowa Rapid (9.42 miles below Lewiston).—It has a length of 0.19 of a mile and a fall of 1.1 feet giving a rate of fall of 5.79 feet per mile. Seven feet was the shoalest water found here. No special obstruction to navigation exists.

7. Steptow Rapid (11.06 miles below Lewiston).—It has a length of 0.55 of a mile and a total fall of 5.3 feet, or a rate of fall of 9.64 feet per mile. The difficulty here
5277 is the strong current, 7.1 miles per hour, and the crooked, narrow channel. Five and five-tenths feet depth at low water was found at the shoalest point. The river at the head of the rapid has a width of about 750 feet between high banks, and is divided by a low island 500 feet wide and 1.5 feet above low water. This throws the main body of water into a channel on the right about 250 feet wide, the other channel on the left being only about 120 feet wide and 1 foot deep. This reduction of the sec-

tion, taken in connection with a shoal just above the rapid, has a damming effect, the channel acting as a spillway. The improvement proposed at this place includes the deepening and straightening of the channel by dredging.

8. Little Pine Tree Shoal (13.01 miles below Lewiston).—It is probably caused by the river attaining the extreme width of 1,000 between low-water shore lines with a very uniform cross section. The depth of water varies from 2 to 7 feet, and falls at the rate of 4.5 feet per mile with a current of about 4 miles per hour. Dredging is necessary at this place.

9. Little Pine Tree Rapid (13.12 miles below Lewiston).—This rapid has a length of 0.28 of a mile and a fall of 6.9 feet, or at the rate of fall of 24.64 feet per mile. The only special impediment to navigation is the strong current, which flows at the rate of 7.5 miles per hour.
5278 The least depth of water found here was 8 feet. The rapid is caused by a low gravel bar which extends out from the right bank about 400 feet. This has the effect of diminishing the width of the river from 900 feet just above the bar to 350 feet opposite it. No improvement is proposed at this place.

10. Riffle No. 2 (15.03 miles below Lewiston).—No difficulty is now experienced in navigating the river at this point. The rate of fall per mile is but 1.5 feet, with a slow current; 4.5 feet was the least depth found. No improvement is thought necessary at the present time.

11. Tramway Rapid (16.06 miles below Lewiston).—This place offers now no special difficulties to navigation. The rapid has a total fall of .8 feet, or at the rate of 8 feet per mile. It is but 0.1 of a mile in length. The least depth found was 13 feet.

Bucket Tramway (17.36 miles below Lewiston).—Consists of a system of buckets hung on a wire rope for bringing wheat down from the farming land, about 1,500 feet above the river, to the steamer landing on the south bank of the river.

12. Rapid No. 8 (19.73 miles below Lewiston).—It is 1.17 miles in length and has a total fall of 5.2 feet, or at the rate of 4.45 feet per mile, with a current of 5.2 miles per hour. It has never been considered a difficult place to navigate. Four feet was the least depth found. Sev-
5279 eral boulders should, however, be removed at this place.

13. Rapid No. 9 (23.73 miles below Lewiston).—It has a length of 0.17 of a mile and a fall of 2.4 feet, or at the rate of 14.12 feet per mile. It has a current of 7 miles per hour. The only impediment offered to navigation is the strong current, there being 5 feet of water at the shoalest places.

14. Granite Pine Rapid (25.13 miles below Lewiston).—It is 0.41 of a mile in length and has a fall of 4.9 feet, or at the rate of 11.95 feet per mile. It has a current of 5.35 miles per hour. The only important obstruction to navigation at this point consists of two rocks about 1.5 feet below low water. These rocks aggregate about 50 cubic yards. The rapid is caused by a sunken ledge of rocks extending across the river which has caused a bar about 600 feet wide to form on the right bank. The effect of this is to reduce the distance between the water lines from 900 feet above the rapid to 400 feet at its narrowest place. There are many sunken rocks and boulders in this stretch, but a fair channel is open near the left bank. The soundings gave 5 feet of water at the shoalest place. The two boulders above mentioned should be removed.

Granite Point (26.51 miles below Lewiston).—A granite ledge cropping out about 150 feet below the level of the water at the north side extends across the river,
5280 showing on the opposite bank. The granite in this quarry is of an excellent quality. It has been worked for about twenty years. Among other structures built of this stone might be mentioned the piers for the bridge across Snake River at Ainsworth, and the new Custom House at Portland, Oreg. The water at this place has a depth of 45 feet, being the deepest water between Lewiston and Riparia.

Tramway (28 miles from Lewiston).—A tramway on the left bank of the river which is operated by the gravity system, the loaded cars coming down pulling the empty cars up. It is for the purpose of bringing wheat down to the river from the farming lands on the high plateaus.

Wawawa is a small settlement on the right bank of the river, 29.3 miles below Lewiston. A current ferry is operated at this point, it being one of the crossings of the Pomeroy-Colfax wagon road.

15. Ofields Bar (31.56 miles below Lewiston).—The

river at this place has a low-water width of 800 feet, and a high-water width of about 2,500 feet. It has a fall of 6.2 feet in 0.5 of a mile, or at the rate of 12.4 feet per mile, and has a current of 6.3 miles per hour. About 100 feet out from the right bank there is a long, narrow island exposed for a width of about 20 feet at low water, which parallels the shore for about 1,000 feet. This terminates at the lower end in a bar which ex-
5281 tends diagonally across the river, connecting with a small island near the right shore about 1,200 feet below. The water on this bar has a low-water depth of 1.5 feet. Between the upper end of this narrow island and the left shore of the river the water has a depth of 4 feet, and a point about opposite the lower end of the island and about midway between it and the left shore the water has a depth of 5.5 feet extending up and down stream for about 400 feet. The method employed in navigating this part of the river at low water has been to keep near the right shore, passing through the chute-like channel between the narrow island and the right shore and following the right bank for about 400 feet above the head of the island (see map). This is necessary on account of shoal water extending above the head of the island. The current is very strong in this narrow passage, necessitating the use of a line on up-stream boats. This narrow channel has a depth of 2 feet at its shoalest place, but owing to its trough-like shape the action of the wheel prevents up-stream boats from getting full benefit of the water. It is proposed to improve this place by cutting through the bar below the island, thus allowing boats to pass into this deep water opposite its lower end. Between this point and the deep water above the shoalest water found was 4 feet.

16. Log Cabin Rapid (32.81 miles below Lewiston).—It has a length of a mile and a fall of 3.3 feet, or at the
5282 rate of 7.33 feet per mile, and has a current of 5.10 miles per hour. By following a tortuous channel a depth of 3 feet was found. Just above the shoal the river, which has a width of about 700 feet, is divided by a low island about 300 feet wide and 1,500 feet long. Near the right shore the water passing to the right of this island has a width of about 250 feet and a depth of about 1.5 feet. This island terminates at its lower end in a shoal which

extends across the river, giving a depth of 3 feet near the left bank. A dike, now in bad repair, has been built by the United States in previous years to prevent the water from passing behind this island and by throwing all the water into the main channel to increase its depth. The method of navigation employed with up-stream boats has been to skirt the left shore until about opposite the lower end of the island, then turn abruptly toward the deeper water about midstream. A crib filled with rock has been erected near the left bank at the point where the turn is made to prevent boats from drifting upon the rocky shore. As the channel is so near the shore, this has always been a very difficult place to navigate, especially during high winds. The proposed improvement contemplated repairing the dike mentioned and cutting a straight channel 5 feet deep through the shoal.

17. ALTOMA DEAD MARCH (33.94 miles below Lewis-
5283 ton).—It has a length of 0.92 of a mile, with a total fall of 5 feet. It has two pitches, one of which falls at the rate of 5 feet to the mile with a current of about 5 miles per hour, the other at the rate of 8.33 feet per mile with a current of 7 miles per hour. This last pitch is about 0.1 of a mile in length. The soundings showed a 3.6-foot channel at low water. The river has a low-water width of about 600 feet and a high-water width of about 1,500 feet. No difficulty is generally experienced in navigating this portion of the river, and no improvement is proposed at present.

ALMOTA (36.30 miles below Lewiston).—A settlement on the right bank of Snake River and is the principal settlement between Lewiston and Riparia. The building of railroads on the table-lands back from the river on each side has robbed it of much of its importance, but large shipments of wheat are still made from this point. A current ferry is operated here, it being on the Pomeroy-Colfax wagon road.

18. ILIA BAR (37.62 miles below Lewiston).—The river at this point has a low-water width of about 1,000 feet and a high-water width of about 1,400 feet. Opposite the lower end of the shoal the river is divided by a large island, the main body of water flowing to the left and a stream about 250 feet wide and 1 foot deep flowing to the right. The shoal connects the upper end of the

island with the left shore. This is not considered a difficult place. A 4-foot channel was found. No improve-
5284 ment is proposed at present.

19. Ilia Rapid (38.13 miles below Lewiston).—It has a length of 0.59 of a mile and a fall of 7.4 feet, or at the rate of 12.53 feet per mile, with a current of 7.6 miles per hour. The least depth of water found was 6 feet. At about the head of the rapid the river is divided by a large island which crowds the main body of water into a channel on the left about 330 feet wide. The channel, which keeps to the right of the island, is about 250 feet wide and 1 foot in depth. The only impediment to navigation at this point is the strong current. No improvement excepting the removal of one rocky boulder is considered necessary.

Ilia (38.57 miles below Lewiston).—A small settlement on the left bank of the river, and is a wheat-shipping point of considerable importance.

20. Lower Ilia Rapid (40.21 miles below Lewiston).—It has a length of 0.12 miles and a fall of 1.4 feet, or at the rate of 11.67 feet per mile. There is no impediment to navigation at this place. The shoalest water found was 5 feet.

21. Wades Rapids (42.61 miles below Lewiston).—It has a total length of 0.59 of a mile and a total fall of 4.5 feet. The upper half falls at the rate of 5.77 miles and has a current of 7 miles per hour. The lower half
5285 falls at the rate of 5.77 miles per hour. The river, which is about 900 feet wide just above the rapid, is divided by Atwood Island, which throws the main body of water into a channel on the right side about 300 feet wide. The channel on the left of the island is about 100 feet wide and 1.5 feet deep. The least water found on this rapid was 6 feet. The only impediment to navigation is the strong current. No improvement is proposed.

22. Rapid No. 16 (46.01 miles below Lewiston).—It has a length of 0.27 of a mile and a fall of 2.3 feet, or at the rate of 8.22 feet per mile, with a current of 4.50 miles per hour. The river has a width of about 600 feet. The least depth found was 5 feet. No obstruction to navigation was found here.

23. Upper Pennewawa Rapid (47.93 miles below Lewiston).—It has a length of 0.36 of a mile and a fall of

3.3 feet, or at the rate of 9.17 miles per hour. It has a current of 7 miles per hour. The shoalest water found was 5 feet. The rapid is caused by an insufficient cross section, the river narrowing down to about 400 feet between low water lines. No improvement is now needed at this place.

24. Lower Penewawa Rapid (48.72 miles below Lewiston).—It has a fall of 1.5 feet in a distance of 0.20 of a mile, or at the rate of 7.5 feet per mile. The river has a width of about 600 feet and a depth of 6 feet.
5286 No improvement is necessary except removing two rocks, aggregating about 40 cubic yards.

Penewawa (49.56 miles below Lewiston).—A small settlement on the right bank of the river. It has a store, post office and hotel. A current ferry is operated here.

25. Willow Rapid (50.74 miles below Lewiston).—It has a total length of 0.66 of a mile divided into 2 pitches. The first has a fall of 2.5 feet, or at the rate of 10 feet per mile, and a current of 8 miles per hour; the second has a fall of 2.8 feet, or at the rate of 6.83 feet per mile, and a current of 7.4 miles per hour. The least depth of water found was 6.5 feet. The river just above the rapid has a low-water width of about 800 feet. It is divided by an island which contracts the main channel to a width of about 300 feet. The main body of water flows to the right of the island. The channel to the left is about 30 feet wide and 1 foot deep. The only impediment to navigation at this place is the strong current, which, setting toward the head of the island on the left, sometimes necessitates the use of a line. No improvement is proposed.

Central Ferry (56.57 miles below Lewiston) is a current ferry at the crossing of wagon road.

26. Dead Man Rapid and Bar (56.86 miles below Lewiston).—It has a length of 0.36 of a mile and a fall of
5287 4.4 feet, or at the rate of 11.28 feet per mile. It has a current of 6.10 miles per hour. The soundings gave a depth of 2.8 feet at the shoalest place. The river at this point is divided by Dead Man Island, the main channel, about 600 feet wide, going to the right. The channel passing to the left is about 200 feet wide and 1.3 feet deep. Dredging to 5 feet depth will be necessary.

27. Diamond Crossing (58.32 miles below Lewiston).

—It is a long, diagonal bar extending from New York Bar on the left to the right bank. Three feet was the least depth found at this shoal. To secure a 5-foot channel it will be necessary to dredge.

28. New York Bar Rapid (59.96 miles below Lewiston).—It has a length of 0.44 of a mile, and a fall of 3.80 feet, or at the rate of 8.64 feet per mile. It has a current of 7 miles per hour. The least depth found here was 6.5 feet. The river above the rapid has a width of about 1,200 feet. It is divided by a low island about 800 feet wide, the main body of water flowing to the right through a channel about 400 feet wide. The channel to the left is about 50 feet wide. The rapid is the result of this narrowing of the waterway. The strong current is the only impediment to navigation. No improvement is proposed.

29. Upper Goose Island Rapid (63.76 miles below Lewiston).—It has a length of 0.47 of a mile and a fall of 4.3 feet, or at the rate of 9.15 feet per mile, with a
5288 current of 7 miles per hour. Three and five-tenths feet was the least depth found. Just above the rapid the river has a width of 1,300 feet and is here divided by the upper island of the group known as Goose Island, which extends down the river for about 4 miles. These islands are three in number, the most elevated being about 16 feet above low water, the river at this point being 2,000 feet wide. The main channel keeps near the right bank and is about 400 feet in width. The channel on the left of this upper island is about 475 feet wide and has a depth of 5 feet. This is again divided. One branch, bearing to the right, passes between the upper island the second of the group. This channel has a width of about 200 feet and a depth of 1 foot. The channel has a width of about 200 feet and a depth of 1 foot. The channel which keeps to the left has a width of about 250 feet and a depth of 1.5 feet. It has a very strong current and is blocked with many bowlders. It is not considered necessary, however, to make any improvement at this place at this time.

30. Goose Island Bar (64.60 miles below Lewiston).—This bar has formed in the pool between upper Goose Island Rapid and Goose Island Rapid proper and near the head of the latter. The water on the bar has a depth

of 2 feet. The river here has a width of about 1,800 feet and is divided by the lower island of the Goose Island group, the upper end of this island being about opposite the bar. A shallow channel flows between the second of the group and this lower island about 400 feet wide
5289 and 1 foot deep. Two dikes have been constructed across this channel for the purpose of contracting the flow of water over the bar. The first built was placed across the channel at a point about 300 feet back of the shoulders of the two islands. This dike is in bad repair. The last constructed is on a line between the shoulders of the island, but lacks about 500 feet of connecting them. The improvement proposed for this place is to complete the last-mentioned dike and cut a channel 60 feet wide and 5 feet deep through the bar.

31. Goose Island Rapid (64.67 miles from Lewiston). —It has a total length of 0.38 of a mile and a total fall of 5.3 feet at its steepest place. It falls at the rate of 29.17 feet per mile, with a current of 8.8 miles per hour. The shoalest water found over this rapid was 6 feet. The river is here divided by the lower island of the Goose Island groups, the main body of water flowing through a channel on the right about 200 feet wide. The river at this point has a high-water width of about 1,800 feet, there being a low bar on the right about 1,100 feet wide. No improvement is contemplated at this rapid.

32. Little Goose Island Rapid (67.75 miles from Lewiston).—It has a length of 0.35 of a mile and a fall
5290 of 3.5 feet, or at the rate of 10.28 feet per mile, and a current of 5.3 miles per hour. The shoalest water found was 3 feet. The river at this point has a width of about 1,500 feet and is divided by Little Goose Island, the main body of water flowing to the right in a channel about 550 feet wide. The branch flowing to the left is about 100 feet wide and 1.5 feet deep. Near the right bank of the main channel there are many sunken rocks. The steamer channel lies near the right bank of the island. No improvement is considered necessary at this place at the present time.

33. Little Goose Island Bar (68.50 miles below Lewiston).—It is a continuation of Little Goose Island. It begins at the lower end of the island and crosses the river diagonally, connecting with the right bank of the river

about 1,500 feet below. The river at this place is about 1,200 feet wide. The water has a depth of 3 feet at its shoalest place. It is proposed to improve at this place by dredging a channel 60 feet wide and 5 feet deep through the bar.

34. Rapid No. 24 (69.01 miles below Lewiston).—This rapid has a length of 0.47 miles and a fall of 3 feet, or at the rate of 6.38 feet per mile, and a current of 6.5 miles per hour. The least depth found was 6.5 feet. The river at this point has a width of about 550 feet. It is flanked on the right by a low gravel bar about 800 feet wide. No impediment to navigation was found at this place.

5291 35. Upper Riparia Rapid (71.03 miles from Lewiston).—It has a length of 0.29 of a mile and a fall of 3 feet, or at the rate of 10.35 feet per mile, and a current of 6.10 miles per hour. The least depth found was 7 feet. The river is here divided by McGuires Island, the main body of water flowing to the right through a channel about 400 feet wide. The channel is about 200 feet wide and 1 foot deep. No improvement is necessary at the present time.

Riparian Bridge (72.85 miles from Lewiston and 73.5 miles from initial point of survey).—This is the Snake River crossing of the Spokane Branch of the Oregon Railroad and Navigation Company's Railroad. It has a length of 1,008 feet and a drawspan at the south end of 350 feet. Its grade is 38.1 feet above low water and 13 feet above high water. This is the initial point of the survey made of Snake River in 1897 from Riparia to the Columbia River, total length 66.7 miles; Lewiston to this bridge, 72.85 miles; Lewiston to mouth of river, 139.55 miles.

Riparia (end of survey, 73.25 miles from Lewiston and 73.5 miles from initial point of survey).—A station on the Spokane Branch of the Oregon Railroad and Navigation Company's Railroad. At this place all freight to and from river points between Lewiston and Riparia is transferred to rail, it being the lower terminus of the steamboat line to Lewiston.

5292 The vessels now in Snake River, between Lewiston and Riparia, are all stern wheel, flat-bottomed boats, a list of which, with their dimensions is as follows:

	Length.		Beam.		Depth.		Draft. Light.		Loaded	
	Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.	Ft.	In.
Spokane	100	4	38	6	6	3	2	0	3	8
Lewiston	165	0	34	4	5	3	1	0	2	6
Almota	157	0	36	0	5	0	1	8	3	6
Norma	160	0	32	6	5	6	1	11	3	4
	191	0	36	4	6	0		27	3	9

The difficulties encountered arise in all cases from insufficient depths, occasional obstructing bowlders, and swift currents. Near low water stages the steamers find it necessary at present to lay out ropes fastened to trees or to posts conveniently placed and haul themselves with steam windlesses over shoal places and through rapids too swift to be navigated otherwise. The boats being all flat-bottomed and the bars in this part of the river being all sand and gravel, this can be done without damage until the depth of water becomes insufficient, when navigation ceases. The dimensions of the above steamers are said to be those found best by experience for the conditions to be met in this river, and will not likely change much in the future unless the conditions are decidedly altered.

5293 The comparatively large cross section of the river, the large discharge (22,000 feet per second), and the relatively high average slope (2.67 feet per mile) render the effect of the proposed dredged channels unimportant in changing the area of cross section so as to injuriously alter the currents or levels above, especially as the depth of cut to obtain 5 feet at low water is in most cases slight and not over 3 feet at the worst places. The dikes proposed to not increase the currents above what can be easily ascertained by the present boats. The river bottom at all these places is composed of coarse sand and gravel and small cobblestones which, if not found practicable to remove by increasing the currents by contracting dikes, can probably be easily dredged with a grapple bucket operated by a hoisting engine from a small derrick scow, especially if the bottom should be first loosened with small charges of explosives. In for-

mer years a heavy scraper towed by a steamer gave fairly satisfactory results in scraping bars.

A depth of 5 feet at low water has been selected in the project for the improvement of the river below Riparia (see House Doc. No. 411, Fifty-fifth Congress, second session), and any extensive improvement above
5294 Riparia to be effective should provide no less depth than this over all the above named shoals. The thorough improvement of this section would therefore probably require a deepening of the channel through all these shoal places, the construction of a number of deflecting dikes to secure and maintain the depths, and the removal of all the boulders and rocky points likely to interfere with vessels at low water.

The navigation of this section of river, however, is at present limited to one vessel each way daily, and it is not deemed advisable to include more points for improvement at the present time than necessary to relieve the most troublesome places. Low water periods are of short duration, and present conditions are satisfactory except at low stages. For these reasons the extent of improvement proposed in this report provides only for the following, the dredged channels being 5 feet deep at low water and in most cases 60 feet wide."

5370 Thereupon counsel for defendant read in evidence extracts from the report of the Chief of Engineers for 1876, part 2, as a supplement to the part theretofore read by counsel for complainant upon pages 204, 206, 207, 209 and 234 to 239.

5371 Page 204:

"The river" (says Marquette) "on which we embarked is called Meskousing," (Wisconsin). "It is very broad, with a sandy bottom, forming many shallows, which render navigation very difficult. It is full of vine-clad islets. On the banks appear fertile lands diversified with wood, prairie and hill. Here you find oaks, walnut, whitewood, and another kind of tree with branches armed with long thorns. We saw no small game or fish, but deer and moose in considerable numbers."

5371 Pages 206-7:

The limestone bluffs and highlands begin on the Wisconsin about 8 miles below the portage. Just above

Prairie du Sac appears to be the apex to the highland of the Wisconsin and the head of the great valley through which that river winds. The river is full of islands, formed by the sand-bars, which are constantly increasing in number. The general depth of the river is, at the ordinary height of the water, 4 to 5 feet, but the sand-bars often extend entirely across the river, and have not more than 8 or 10 inches of water; the sands, however, are quick, and oppose but little resistance.

5372 Page 209:

The Wisconsin may be rendered navigable by the removal of the timber from its banks where it overhangs the channel, and occasionally contracting its waters by closing the heads of the sluices or shallow channels around the islands. * * * Its general width is about a mile; these improvements, therefore, will permit the steamboats which navigate the Upper Mississippi to ascend this river to the Great Bend nearest to Lake Michigan.

5372 Pages 234-9:

The Lower Fox forms the outlet of Lake Winnebago, a body of water 35 miles long, from 9 to 14 miles wide, with depths varying in the deepest parts from 12 to 25 feet. Over the 15½ miles of lake navigation, between the Upper and Lower Fox Rivers, there is a depth of over 20 feet. This lake is a great reservoir, and prevents any sudden changes in the volume of the outlet from freshets —the extreme fluctuations in the Lower Fox not exceeding 3 or 4 feet. The level of the lake does not reach more than 3½ feet above the ordinary level maintained by the dams at the outlets, but it is occasionally drawn down by the water-power mills nearly 2½ feet below this level. The total fall from Lake Winnebago to Green Bay is about 170 feet, and the distance 37½ miles. The minimum volume of the Lower Fox is given by Mr. Westbrook at 2,320 cubic feet per second.

5373 The following table is made up from the figures of Major Suter's report, as modified by me in arrangement in the foregoing abstract:

TABLE IN REGARD TO THE LOWER FOX RIVER IN THE AUTUMN OF 1867.

Place	Intermediate Distance.	Distance from mouth of river.	Number of locks.	Elevation overcome.
	Miles.	Miles.		Feet.
Depere, dam	7	7	1	8
Little Kaukana, dam	6	13	1	8
Rapid Croche, dam	6	19	1	8
Grand Kaukana, dam	4½	23½	5	50
Little Chute, dam	2½	26	4	38
Cedars, dam	0¾	26¾	1	10
Appleton, lower dam	3	29¾	1	8½
Appleton, upper dam	0¾	30½	3	29½
Menasha, dam	5	35½	1	10
Lake Winnebago	2	37½	.	.
Total	37½		18	170

(Continued next page.)

5374 TABLE IN REGARD TO THE LOWER FOX RIVER IN THE AUTUMN OF 1867.
(Concluded.)

Place.	Height above Green Bay.	Cost of making navigation from one dam to next above. For 4 feet draught, locks 160 x 35.	For 6 feet draught, locks 220 x 35.
	Feet.		
Depere, dam	8	$45,000.00	$83,300.00
Little Kaukana, dam	16	3,000.00	27,730.00
Rapid Croche, dam	24	4,000.00	41,000.00
Grand Kaukana, dam	74	22,800.00	111,670.00
Little Chute, dam	112	17,530.00	77,200.00
Cedars, dam	122	3,930.00	23,400.00
Appleton, lower dam	130½	.....	11,000.00
Appleton, upper dam	160	18,870.00	63,870.00
Menasha, dam	170	13,270.00	54,200.00
Lake Winnebago	170	.....	.....
Total		$118,400.00	$493,370.00

5375 Condition of the Upper Fox River and improvement in 1866.—The present traveled route between Oshkosh and Fort Winnebago is 104 miles, the air-line being 54 miles. As near as can be estimated, there have been 18,000 feet of cut-off by dredging making a saving of about three-fifths of the distance. The total fall is about 33-1/10 feet. In most places there is a fall of a foot in 2½ miles, but there are long reaches where the fall is scarcely perceptible. Several lakes occur on the course of the river, which are generally shallow and full of wild rice.

The mouth of the Fox River at Oshkosh is very deep; the channel has upward of 20 feet of water, which continues along the whole river-front of the town; thence to Lake Buttes des Morts, and through that lake there is over 12 feet of water; the river is broad and deep, with no perceptible current. About 10 miles from Oshkosh the Fox is joined by the Wolf River, a stream of nearly its own size. This river is navigable for about 50 miles; it penetrates into the lumber regions in the northern part of the State, and a great quantity of logs and sawed lumber is floated down the river to Oshkosh.

After passing the mouth of Wolf River 6 feet is the least depth until we reach Omro Bar, half a mile below the town of that name; thence to the town, 4½ feet of water. This portion of the river is quite crooked,
5376 but this is of no great importance to small vessels, on account of the depth of the water. Two miles below Omro a cut about a mile long, carrying the waters of the Fox straight to Lake Buttes des Morts, would save 7 or 8 miles of distance. From Omro to Delhi there is about 5 feet of water; never less, except in small spots. Above Delhi there is the same depth to Eureka Bar. From here to the town of Eureka 1½ miles, there is only from 4 to 4½ feet, with occasional deep spots. In front of the town there is 6 feet of water. At Eureka there is a permanent bridge, the only one between Berlin and Oshkosh. There are several floating bridges, however, where country roads cross the river. From Eureka to Sacramento there is an average depth of 6 feet. The river is quite narrow.

Above Sacramento there is an average depth of 5 feet

halfway to Berlin; then from 4 to 4½ feet as far as a floating bridge three-quarters of a mile below Berlin. Above this bridge, and also in front of the town of Berlin, there is about 5 feet of water. Between Sacramento and Berlin there is not much marsh along the river, and the banks are generally high. Above Berlin, the average depth is from 5 feet to 6 feet for 8 miles. At this point there is a short bar on which the water is only 3½ feet deep. The average depth above here is from 5 feet to 6 feet, until the mouth of the Puckeyan River is reached.
5377 Just above the mouth of this stream is a short bar with 3½ feet of water. At the lower end of Willow Bend is another short bar with 3½ feet of water. At the mouth of White River is a bad bar 300 yards long, and having only 3 feet of water on it. In the west side of the first bend above White River is a flat bar caused by a sudden widening of the stream. It is 200 yards long, and has 3½ feet of water on it. (The lowermost wing-dam is about 2 miles below State Centre.) There is a bar below this lower wing-dam with 3 feet of water. Above this wing-dam there is from 3½ to 4½ feet of water; usually 4 feet and often more. The banks of the stream from Berlin to the lower wing-dam are generally low and marshy, but above this point they are quite high, and continue so to the mouth of the Mechan River. There is a second wing-dam at State Centre. At Saint Mary are the ruins of a bridge. From Saint Mary to Princeton the river is quite shoal. The average depth is 4 feet, but on the bars there is less than 3 feet. There are two more wing-dams at Princeton. There is also at this point a good, permanent bridge across the Fox.

Between Princeton and the mouth of Mechan River there are three wing-dams. In this portion of the river
5378 the water is quite shoal, not more than 3 feet deep. From Omro to the mouth of Mechan River the fall is about 1 foot in 2½ miles, and there is quite a strong current. Above Mechan there is slack-water to Lake Puckaway. The river is very wide, with 6 feet or 8 feet depth of water or more. Within the Big Bend, above Princeton, the ground is quite high, about 30 feet above the level of the river. If a canal could be cut through here about 10 miles would be saved, as the neck is only a mile wide.

Lake Puckaway is a sheet of water 8¼ miles long and

from 1 to 2 miles wide. The lower end of the lake is very shallow and full of reeds and wild rice. A channel, running northeast from Marquette, has been cut through for steamers. It is from 3 feet to 3½ feet deep. A channel, having 4 feet of water, leads along the eastern shore of the lake. The bottom of the lake is very soft, black mud, through which a channel of any depth can be easily dredged. For about a mile to the westward of Marquette the lake is filled with rushes. A channel exists, however, which has about 4½ feet of water. After getting out of the rushes, there is from 5 feet to 6 feet of water to the end of the lake.

At the mouth of the Fox, that is, where it enters Lake
5379 Puckaway, there is a bar half a mile long, where there is only from 3 feet to 3½ feet of water; above this there is 5 feet or 6 feet for about 3 miles. Just below the large bend there is about 4½ feet; then for a mile from 6 feet to 7 feet. The rest of the way to Montello the river is shallow. Three and a half feet is the average depth, and 3 feet is the least. There are a good many sand-banks just below Montello which wash into the stream and cause bad bars. The current between the lake is quite rapid.

At Montello, a lock and dam are being constructed to raise the water above Lake Buffalo. As shown by the plan, it is designed to cut the canal through into a bayou, which has a depth of about 7 feet. The Montello River has also been turned into this bayou.

The dimensions of the lock, dam, and canal when finished will be as follows: Dam, 151 feet long; canal, 650 feet long and 90 feet wide; lock-lift, 3 feet; depth on lower miter-sill, between 8 feet and 9 feet; height of lock, 15 feet; length, 160 feet; width, 35 feet; composite lock, with head-walls of masonry.

Above the mouth of Montello River there is from 4 to 4½ feet of water as far as the lower end of Lake Buffalo. Lake Buffalo is a large rice-field, about 13½ miles long
5380 and half a mile wide. The Fox crosses it in a very tortuous but deep channel. After entering the lake there is from 6 feet to 9 feet as far as Packwaukee, and even as deep as 15 feet. This is a pile-bridge across the lake at Packwaukee. From Packwaukee a good channel leads to the end of Buffalo Lake. The water runs from 7 feet to 9 feet in depth. Between Lake Buffalo and Lake

Menomin there is a channel of about the same depth, and also through Lake Menomin. This channel is exceedingly crooked. Lake Menomin is a large wild rice-field like Lake Buffalo. It is 1½ miles long by half a mile wide. After leaving this lake, and especially after passing Merritt's Landing, just above Moundville, a series of small, but bad, bars are met with. They are caused by the washing of a high sand-bluff on the river-bank. These bars have barely 3 feet of water on them. The worst of them could be avoided by a cut-off. In the last mile below Roslyn the channel is as a general rule quite deep—from 6 to 8 feet; but shoal spots occur, where only 4½ feet is to be found. The channel is exceedingly crooked and narrow. A great many cut-offs should be made in this portion of the river.

From Roslyn to the first cut-off there is from 5½ to 7 feet of water. Just below this cut-off is a short bar with only 3 feet of water. In the cut itself there is about
5381 4 feet. Above the cut is another bar with 3 feet depth. This first cut-off is only about 40 feet long; but it saves nearly a mile of distance. From the first to the second cut-off the depth is about 4½ feet. In the cut-off there is a bar with about 3 feet of water. The rest of the cut has a depth of about 4½ feet. From the second to the long cut-off there is from 6 to 9 feet of water. At the lower end of the long cut-off there is 5 feet of water; at the middle, 4 feet; at the upper end, 3 feet, with a short bar having from 2 feet 8 inches to 3 feet. From the end of the cut-off to Governor's Bend lock there is about 5 feet of water. Between Governor's Bend lock and Roslyn the stream is very crooked, and several long cut-offs should be made. The cut-off just below Governor's Bend is about a mile long, and saves about 3 miles. Governor's Bend lock, dam about 4 feet high and 69 feet long. Canal, 570 feet long and 57 feet wide. Lock, composite; lift 4 feet; depth on lower miter-sill, 5 feet 6 inches; height, 15 feet; length, 160 feet; width, 35 feet; new and in good order. From this lock to Winnebago lock there is slack-water. The channel leads almost entirely through cut-offs, and is quite free from sharp bends. The width of these cut-offs is about 60 feet. The depth will average 4½ feet to within a mile of Winnebago lock. In this last distance the channel is
5382 full of sand-bars. The water gradually shoals from 4½

feet to 2½ feet. At the foot of Winnebago lock there is 8 feet of water.

At Winnebago lock the lift is 7 feet; depth on lower mitersill, 6 feet 1 inch; height, 17 feet; length, 160 feet; width, 35 feet. Composite lock with masonry head-walls; all in good order.

The canal which connects the Fox and Wisconsin Rivers is quite shoal. At the lower end it is 5 feet deep for about 200 feet; then 3 feet deep to within 500 feet of the first railroad-bridge; then 2½ feet deep to the second railroad-bridge; then 2 feet deep to the town of Portage. At the upper or Wisconsin end it is about 18 inches deep. The mill at the lower end draws the water down about 1 foot. At the upper end of the canal is a guard-lock, which is used as a lift-lock when the Wisconsin is high. It is in a very dilapidated condition, and should be rebuilt. It is 2¼ miles (12,400 feet) in length, and 75 feet in width. It is cut through a flat, sandy plain which separates the waters of the Fox from those of the Wisconsin. The Fox River is about 5 feet lower than the Wisconsin in ordinary stage of water. During high water the Wisconsin overflows this neck of low ground at Portage, and also 5 or 6 miles above, and a large portion of its waters are thus diverted to Green Bay. The spring rise in the Fox is principally owing
5383 to this cause, for the Fox itself fluctuates very little. About 7 miles below Portage a stream called Big Slough comes into the Fox. During high water this connects with the Wisconsin and becomes a very considerable stream, bringing a large volume of water into the Fox. In fact, the greater part of the low country between the two rivers is overflowed by the Wisconsin at this time. It will be seen that the canal is not straight, but makes a considerable bend to the westward. The object of this was to place the mouth of the canal on the Wisconsin side, above an island. It was afterwards proposed to give it a different direction, but the idea has never been carried out. At present the main bulk of the Wisconsin runs through the inshore channel, and the whole of it can be diverted through there if desirable. It is also much easier to protect the mouth of the canal in the proposed position than in the one it occupies at present. But the change is not a matter of any great importance.

The canal at present is almost filled up with sand, but it is being dredged out.

The only plan of improvement of the Upper Fox River which gives promise of permanency is to create slack-water navigation throughout the whole length of the stream by means of locks and dams. As a great deal
5384 of valuable property would be overflowed and ruined by putting in high dams and locks of great lift, it appears preferable to use low dams, say 3 feet high, and then lower the bed of the stream above and below the dam by dredging sufficiently to destroy the current. Further dredging will give the requisite depth for navigation, and the channel thus made will remain permanent.

Three locks appear necessary between the mouth of Mechan River and Omro. Above the former and below the latter point there is slack-water already, or will be when certain improvements in progress are finished; notably the Montello lock and dam.

The total fall between Mechan River and a point 1½ miles above Eureka is 12.87 feet, which it is proposed to distribute as follows: one lock at Princeton, 4 feet lift; one lock at Fiddler's Bend, 4 feet lift; and one lock 1½ miles above Eureka, 5 feet lift.

Ten feet of this total lift is included in the 12.87 feet, the remainder of that sum being allowed for backwater and flowage.

Details from Winnebago lock to Governor's Bend lock; distance, 5½ miles; fall not accurately known, as the bed of the stream has been much lowered by dredging since the last survey was made. The lock has about
5385 4 feet lift, so that the fall is probably between 4 and 5 feet. Slack-water exists above Governor's Bend dam.

Governor's Bend lock to Montello lock; distance 21 miles; fall, 5.95 feet, as nearly as can be computed. This is thought to be too much. The Montello dam is to raise the water 3 feet, and it is proposed to lower the bed below Governor's Bend lock 1 foot by dredging. This will, it is hoped, give slackwater back to Governor's Bend lock; but, in case it does not, the Montello dam can be raised 1 foot more. It will probably be necessary to lower the bed of Governor's Bend lock 2 feet to enable a vessel drawing 6 feet of water to get through it; but this cannot be stated positively until a new set of levels has been run to ascertain the exact amount. The

Montello dam can be raised, if necessary, without overflowing a great extent of country.

From Montello lock to head of Lake Puckaway: distance, 7 miles, fall, 4.93 feet. Bed of stream to be lowered 4 feet by dredging below the Montello lock, leaving .93 foot fall in 7 miles, or about .13 foot to the mile. From the head of Lake Puckaway to the mouth of Mechan River there is slackwater.

From mouth of Mechan River to Princeton lock: distance, 5¾ miles; fall, 2.57 feet. Water to be raised 2 feet by a dam, and lowered below the dam 2 feet by dredging. Lock, 4 feet lift; flowage, .57 foot.

5386 Princeton lock to Fiddler's Bend lock: distance, 12 miles; fall from foot of Princeton lock, 2.92 feet. Water to be raised 2 feet by the dam, and lowered 2 feet below the dam by dredging. Lock, 4 feet lift; flowage, .92 foot.

Fiddler's Bend lock to Eureka lock: distance, 15¼ miles; fall from foot of Fiddler's Bend lock, 3.38 feet. Water to be raised 2 feet by a dam, and lowered below the dam 3 feet by dredging. Lock, 5 feet lift; flowage, 1.38 feet.

From Eureka lock to Oshkosh: distance, 24 miles; fall, 5.80 feet. Water to be lowered 3 feet at upper end of level by dredging, as stated for Eureka lock. This will reduce the fall 2.80 feet in 24 miles, or a little less than 12 foot to the mile, which is practically slackwater.

The volume of the Upper Fox at low water is not stated by Major Suter, nor have I seen it stated for any point of its course. At the lock near Fort Winnebago it is a very small stream at low water, merely sufficing as a feeder to slackwater navigation. Its amount is of no practical importance in this view, for any needed supply can be drawn from the Wisconsin River, which is the feeder for the canal connecting the two streams.

Major Suter states the lift of the lock at Fort Winne-
5387 bago to be 7 feet, and the height of the Wisconsin above the Fox at this point to be 9½ feet. This fall of 2½ feet in 2⅛ miles is inadmissible in a canal for navigation, and is only allowable for supplying water-power. The guard-lock at the head of the canal communicating with the Wisconsin is also a lift-lock even at low water, and enables vessels to pass into the Wisconsin. To the preceding amount of elevation between the Wisconsin and

Lake Winnebago, as stated by Major Suter, must be added 2½ feet for the Portage Canal guard-lock, and he makes this allowance in his table of total elevations."

5544 SURVEY OF LIEUTENANT G. K. WARREN.

Page 1438.

In 1853, under direction of Lieut. Col. S. H. Long, a survey of the Rock Island Rapids was made by Lieutenant Warren, the report of which was transmitted to the House of Representatives May 20, 1854.

From Lieutenant Warren's report we gather the following:

"Louisville, Ky., April 6, 1854.

Sir:

Having completed the drawings of the rapids of the Mississippi, constructed from surveys made by order of Lieut. Col. S. H. Long, I have the honor to submit this report on the subject. The instructions required such surveys at the *lower rapids* (Des Moines), and at the upper rapids (Rock River), as were necessary to determine the best and most economical route along the bed of the river for forming a continuous navigable channel, 200 feet wide and 4 feet deep at the lowest stages. It is hardly necessary to state that this required an entirely new survey, the maps made in 1837 by Lieutenant Lee being on too small a scale to exhibit the character and extent of the channels and their obstructions.

5545 The time was too limited with the means at hand for a thorough survey of the river-bed, and it was determined, after a careful examination and consultation with some of the ablest pilots, to confine the more accurate survey to the vicinity of the channel now navigated. This channel is undoubtedly the most practicable one for improvement.

* * * * *

Upper Rapids.—These, beginning at half a mile above the lower end of Rock Island, extend 13 miles up the river. The principal reefs are known as Lower Chain (at foot of rapids), Rock Island Chain (2 miles from foot), Duck Creek Chain (4½ miles from foot), Campbell's Chain (7½ miles from foot), Saint Louis Chain (10 miles from foot); Sycamore Chain (12 miles from

foot), and Upper Chain. Unobstructed spaces intervene between these chains, the greatest being 2 miles, between Campbell's and Saint Louis Chains.

Much of the rock is a very friable limestone, and when quarried breaks up in the smallest pieces. A very soft yellow sandstone is also common and a little slate. Large granite boulders are found in many places.

Owing to the softness of the rocks composing the reefs, they have been much more worn away and dislocated by the ice and currents than at the lower rapids, and do not form as great an obstruction. Small steamboats drawing 2½ feet of water pass them at the lowest stages towing their barges. The navigation, however, is attended with great risk, and every year that has low
5546 water sees several steamboats sunk and others seriously injured.

Duck Creek and Campbell's chains are particularly dangerous. The current is moderate at both (about 3 miles per hour), but the boat to avoid the prominent rocks is required to make such sudden turns as cannot often be performed, especially by stern-wheeled boats.

These two chains claim the earliest attention. Sycamore and Upper chains should have the next. Rock Island chain is a continuous flat reef across the riverbed, with a low-water depth of 2½ feet. To make 4 feet a cut through it 600 feet long will be required. The water was raised here about 10 inches by building the dams connecting the islands with the Illinois shore. The width of the river was thus considerably reduced. In the narrowest part it is but 400 yards wide. The average width of the rapids is about half a mile. * * * The chutes behind Campbell's and Fulton's Islands are not navigable, and could not be made so as easily as the channel now used. But slight benefit would result from closing them. The only method of improving the upper rapids is to remove the rocks that now obstruct the channel and close some of the side chutes whose tendency is to produce cross-currents. The following tables show the amount of rock to be removed to make the present channel 4 feet deep.

5547 Davenport, Iowa, December 20, 1866.

Sir:

In obedience to your orders of the 5th of October, 1866, * * * I have the honor to submit the following report, with the accompanying drawings:

I left Keokuk, Iowa, on the 6th of October, 1866, arriving at Davenport, Iowa, the next day, and immediately commenced organizing my parties, and in order that the work might be pushed forward with the greatest dispatch consistent with the importance of the work, and inasmuch as the season for work would be of short duration, I put into the field all the force that could work to advantage.

The hydrographic party was placed under the immediate charge of Mr. J. E. Abbott, civil engineer. Their work included all that related to the topography of the bed of the river, and other information concerning the flow of the water over the rapids.

A large party was placed under the charge of Mr. W. D. Clark, civil engineer, with a view of making an accurate survey of the valley on both sides of the river, showing the meandering of the shores and gathering all other information necessary for the investigation of the several projects for the improvement of the navigation on the upper rapids. Lines of levels were run on
5548 both shores from a point about 4 miles below Rock Island to a point about 4 miles above LeClaire; perpendicular offsets connecting with the main line at various distances from 50 to 500 feet apart, according to the changes in the general feature of the shore, were run.

As the time allowed us would not warrant an entire resurvey of the bed of the river, and moreover, as General Warren's map, wherever tested, proved to be sufficiently accurate, I caused Mr. Abbott's party to restrict themselves at first more particularly to a thorough examination of the bottom on the chains, in order to get the most accurate possible data for estimating the amount of rock excavation necessary to make a channel of 200 feet width and 4 feet deep in low water. A favorable season has, however, enabled us to accomplish more hydrographic work than could reasonably have been anticipated.

The upper or Rock Island Rapids begin at a point near the lower end of Rock Island, and extend 14.26

mile up the river to a point near the lower end of the town of LeClaire. The bed of the river throughout this entire distance consists of a hard surface of limestone rock, worn in many places into deep furrows by the long continued action of the water and the material washed along the bottom. This rock crops out along the shores,
5549 and is generally found stratified in thin layers. The lower strata in the bed of the river appear to be harder, and of different thicknesses—from 4 inches to 2 feet and upward. There are also a number of large, erratic boulders of granite to be met with, but these, as a general thing, do not prevent serious obstructions, but in some cases as at Campbell's Chain, they rather serve as guide marks for pilots, who would protest against their removal on that account, unless replaced by other equally permanent marks.

The only difficulty in the way of navigating the rapids consists in passing over the chains, of which there are seven, viz.: the upper or Smith's Chain, Sycamore, Saint Louis, Campbell's, Duck Creek, Moline and lower chains. At these places the rocky bed of the river projects out from each shore like a bar, the projecting points sometimes overlapping each other, leaving only a narrow, tortuous channel between them, and in some instances extending like a dam or rocky bar entirely across the river. Between the chains, throughout almost the entire distance, is a wide and navigable channel, with plenty of water for boats that navigate the upper Mississippi and at such places the velocity of the current is much less than on the chains.

Between the head and foot of the rapids, a distance of a little more than 14 miles, nearly eleven miles, are good navigation in the lowest stages, the obstructed portion
5550 covering a distance of only more than 3 miles. * * *

The steamboat channel, beginning at the head of the rapids, runs in close to the Iowa shore, with plenty of water till it strikes the upper chain, generally called by pilots Smith's Chain; here the channel is narrow, crooked and the current swift, having a velocity of more than 3 miles an hour. A large reef or rocky bar, known as Asprey Patch, stands in the middle of what would otherwise be a wide channel. This chain is not considered, however, as difficult or dangerous as most of the others.

Passing Smith's Chain, the channel inclines gradually towards the Illinois shore, until it comes to Sycamore Chain, which is conceded to be the most difficult place to pass on the whole rapids. Here the rocky ledges project out from each shore, leaving between them only a narrow and crooked waterway. The current being swift and the turns short, boats in passing are exposed to strong cross-currents, which tend to sweep them on the lower ledge; besides, in one of the sharp bends a deep pocket has been cut, and a large amount of water runs through it, which, by its action, tends to draw boats into it, where they sometimes become fastened, and to extricate them involves a loss of much time, and is a labor of great difficulty.

The difficulties at Sycamore Chain are not the result of a want of sufficient depth of water, for there is a good
5551 depth in the channel, but they rise from its narrowness and crookedness, together with the strong cross-current that sweeps over it.

After passing Sycamore Chain, the channel runs close to the Illinois shore, passing inside of Crab Island, where it becomes very narrow, and then inclines toward the Iowa shore until, at Saint Louis rocks it reaches a point about mid-way between the Illinois shore and Fulton's Island. Passing the Saint Louis rocks, it again inclines toward the Illinois shore until it reaches Saint Louis Chain, where the channel becomes narrow again, but boats that pass the chains above or below this seldom experience great difficulty here. Below this chain the channel opens up gradually into a stretch of 3 miles, perfectly navigable at all times. In front of Hampton the current becomes quite sluggish.

Opposite the head of Campbell's Island the channel crosses Campbell's Chain, which is not only crooked and exposed to cross-currents, but the rocky ledge extends entirely across the river. In the channel pursued by steamboats across this chain the water is not much deeper than on either side of it. The slough behind Campbell's Island is not used for navigation.

After passing Campbell's Chain, with the exception of
5552 the rocks near Winnebago Island, which are somewhat of an obstruction, the channel is wide and easily navigated until it comes to Duck Creek Chain, nearly 3 miles below. Here it is crooked and narrow, so much so as

frequently to necessitate the use of anchors at low water for the purpose of working boats through. This is another difficult chain to pass through.

Below Duck Creek the channel widens out again, giving good navigation, with the exception of one narrow place for about 2 miles, when it comes to Moline Chain. Here again the ledge of rock extends entirely across the river, and forms in low water an impassible barrier to boats, drawing more than 30 inches. The water passes over this chain at a mean surface velocity of 3.878 feet per second at low water, and a maximum velocity of 5.0545 feet per second, as determined by actual observation with floats.

The dams of Moline and Benham's Island cut off a large body of water that would otherwise flow out of the main channel, and the universal testimony of the pilots establishes the fact that they have raised the water on this chain some ten inches. It is generally conceded that the navigation has been materially benefited in low water, but the increased volume of water has no doubt increased the velocity of the current, also. During the low stages, however, when the velocity of the current is less than at high water, this increase is of little account in com-
5553 parison with the advantages of getting the increased depth.

From Moline Chain the channel widens out again, becomes deep, inclining towards the Iowa shore, and is perfectly navigable for the largest boats on the upper Mississippi until it comes to the lower chain. The channel here is very crooked, but the current is not so swift as on some of the other chains, and consequently not so difficult to pass. This chain is about half a mile above the Chicago and Rock Island Railroad bridge, and no more natural obstructions present themselves below this point in the ordinary low stages. * * *

The average length of the boating season is about 260 days. During the winter, as a matter of course, navigation is closed by the ice.

When the river is opened to navigation, about one-third of the whole time is rendered dangerous by the shoalness of the water on the rapids and sometimes impassable for boats drawing more than 2 feet. In the year 1864 the water was lower than has been known be-

fore in many years, attaining its lowest point September 2.

From the record of the stages of water kept at the Chicago & Rock Island railroad bridge, it is found that the greatest range between high and low water during
5554 the last 7 years is 15 feet 9-1/2 inches, being the high water of 1862 and the low water of 1864, the mean range during the same period being less than 12 feet.

The range between the highest floods and the lowest water at other points along the rapids, from the best authority that could be obtained, are at Valley City, opposite Hampton, 13 feet 8 inches, and at LeClaire 12 feet, which, if correct, shows a diminution of only 3 feet, 9 inches, in the fall at high water as compared with that at low.

The average width of the river on the rapids is about 1/2 mile. At LeClaire it is only 1,500 feet in one place, but widens out above and below. Below the rapids the river is wider than on them, as may be seen from the map. A line of levels, from the head to the foot of the rapids, shows a fall of 21.46 feet in a distance of about 14 miles, or an average fall of 1.53 feet per mile in low water.

The greatest fall is on Moline and Sycamore chains.

The area of a cross-section at the head of the rapids, where the river is only 1,650 feet wide, is 30,220 square feet; at a point near Sycamore chains, 12,408 square feet; at Moline Chain, 6,829 square feet.

Careful experiments were made on the velocity of the current in order to determine the amount of discharge over the rapids in ordinary low water. For this pur-
5555 pose the stations were taken and a number of velocities between them at different distances from the shore determined by floats; a mean of these was taken as the surface velocity.

The mean area of the two cross-sections at the stations was taken as the rear of the cross-section, and by applying this to D'Aubisson's formula for the approximate discharge of a river, it was found to be 36,456 cubic feet per second. The approximate discharge behind Campbell's Island was also determined in the same manner, and was found to be 10,726 cubic feet per second.

With the exception of the places where the bluffs ap-

proach close to the river the banks are usually steep and rocky. * * *

5556 The question is often asked by men who have navigated this river during many years, and was once asked me by a very distinguished engineer, why I should be in such a haste to get 6 feet of water in this canal at low stage, when the radical improvement of the river is so far from being complete. There are two reasons for this: The first is that the falls of the Ohio are the worst obstructions on the whole river. The works, to give the navigation the relief which it deserves here, should be of a permanent character, and will cost a great deal of money. The normal depth fixed for the improved Ohio River near this obstruction is 6 feet at low-water. The works here should therefore be arranged for such a depth on general principles. The second reason is of more present importance than the first. Everyone who has any knowledge of this river knows that if there were no more water in the canal at the lowest stage than on the bars above and below it, it would fail just when every inch of water is needed in it, that is, when the river has risen 4, 5, or 6 feet above the lowest stage. As the river rises the surface of water in the canal rises equally with the surface of the river at the head of the falls. Now when the river rises above the lowest water stage and begins to be used by navigation, there is a rise of more than 1-1/2 feet on all the bars above and below for every

5557 single foot rise at the crest of the falls of water surface of the canal.

If the depth of water in the canal at the lowest stage were therefore left at 3 feet, when there would be 7, 8 or 9 feet in it due to a rise, there would be 9, 10-1/2 and 12 feet, respectively, over the bad bars above and below. There would then be a deficiency in the depth of the canal of 2, 2-1/2 and 3 feet, respectively. But in determining the available depth of water through the canal, we should always allow at least 1 foot for mud to prevent delay. So that the real deficiency in the depth of the canal at these stages in comparison with what it should be would be 3, 3-1/2 and 4 feet, respectively, at such times. Now, the deeper boats can load at these stages the better it pays them. To keep them a less depth than 6 feet in the canal at the extreme low stage

of the river would be a great injury to commerce, and particularly from now until the whole river is improved.

5558 The Ohio River Basin, according to some bulletins relating to the census of 1880, which I have been able to see, still maintains its supremacy over any other of the portions of the great Mississippi Basin. It still yields enormous quantities of iron, steel, coal, petroleum, wheat, corn, oats, salt and tobacco, and its numerous manufacturing interests are on a steady and healthy increase.

The total internal-revenue collections for the fiscal year which ended June 30, 1881, were over $135,000,000. Of this amount over $87,000,000 were collected in the eight states which, wholly or in part, lie in this basin.

No toll has ever been paid on the Des Moines and Rock Island Rapids in the Upper Mississippi, and Congress has appropriated $5,955,350 to improve them, against $2,600,000 expended here.

In order to improve the navigation to Lake Superior, the Government in 1852 gave the State of Michigan 750,000 acres of land and the right of way to build a canal around the falls of Saint Mary's River, and has appropriated $2,616,000 since for its enlargement and the improvement of the river.

As the work now stands, it is inadequate to serve the interests of the commerce of the Ohio River, and it will become more and more so each year until the additional works suggested by me are completed."

5559 "SPECIAL REPORT.

UNITED STATES ENGINEER OFFICE,

ROCK ISLAND, ILL., March 15, 1880.

GENERAL:

I have the honor to acknowledge the receipt of a letter from your office, dated March 9, 1880, containing a resolution of the House of Representatives calling for certain maps and reports in reference to a proposed widening of the Rock Island Rapids.

The accompanying map (Atlas, p. 3923) (For copy of said map see Appendix, ...), which shows the present 200-foot channel and the work required for increasing this width to 400 feet, was prepared last winter, but as

yet no reports on the subject have been made. I would therefore submit the following:

The Rock Island or Upper Rapids of the Mississippi River extend from Le Claire, Iowa, to Rock Island, Ill., a distance of 14 miles. The river over this reach consists of a succession of deep pools separated by chains of rocks, through which the water, in the course of centuries has cut irregular channels.

The fall from the head to the foot of the rapids is about 20 feet, giving a velocity of current of from 2 to 10 feet per second at the shoal places.

Previous to improvement the rapids could not be
5560 passed by the larger class of steamboats at a 2-foot stage, and at medium stages boats drawing from 3 to 4 feet could only pass on calm days and by using extreme caution.

Congress caused a survey and report on the improvement of the rapids to be made in 1866.

In 1867 the work of excavation was commenced, in accordance with the approved plan, which was to give a channel over the chains 200 feet in width, with a depth of 4 feet below low-water of 1864. From 1867 to 1879, inclusive, $1,150,650 were appropriated, for which sum about 90,000 cubic yards have been removed, virtually completing the above mentioned plan.

The work already accomplished has greatly benefited navigation, but still certain difficulties are met with.

1. The channel is so crooked that it is not practicable in its present condition to provide a system of lights, and the navigation of the rapids is suspended during the night.

2. The width of 200 feet is not sufficient to admit of 2 boats with barges passing each other, so that either the ascending or descending boat must wait in one of the deep pools until the other has passed through a cut.

3. A fresh breeze, acting against the very long and high Mississippi steamers, endangers, and a strong wind prohibits, navigation through the narrow channels.

5561 A. A large steamer ascending the rapids through the comparatively narrow 200-foot channels draws down the water to such an extent as to materially reduce the depth in the cuts, so that a 4-foot channel is not really available at all parts of the rapids during a low-water stage of the river.

The most available plan that can be suggested for overcoming these difficulties is, as shown on the accompanying map, to widen the present cuts, giving a new channel 400 feet in width. By this widening, the second and third difficulties would be done away with, the fourth would be greatly reduced, and by so straightening the channel as to obtain long reaches, lights could be established which would overcome the first difficulty.

To increase the width of the channel to 400 feet, giving a depth of 4-1/2 feet below low-water, which will insure a grade as low as that of the present cut, will require the removal of 299,811 cubic yards of rock, and will cost approximately $1,258,866.

Boats drawing five feet can pass through the Des Moines Rapids Canal during extreme low water.

If it is deemed advisable to give the same available depth and a perfectly safe channel over the Rock Island Rapids, the cuts should be made 400 feet wide, and excavated to a depth of at least 6 feet below low-water of 1864. This would require the removal of 581,835 cubic yards of rock, which would cost approximately $3,491,010.

5562 I have estimated the cost of removing rock at $6 per cubic yard, which would be sufficient, provided an appropriation was large enough to justify the building of coffer-dams and a systematic method of working.

The plans present could undoubtedly be so modified during the progress of the work as to require cutting on but one side of the channel where it is now supposed to require cutting on both sides; such changes, when practicable, will reduce the estimated cost.

The interests of navigation of course require that in time all the proposed work shall be done, but as the obstructions at the Rock Island Rapids are made up of a succession of shoals, the improvement of each may be considered as separate, complete within itself, and benefiting navigation just so much.

The only point in connection with the proposed widening of the channel which has not yet been considered is the effect which the straightening and improving of present channel would have on the depth of the water and the rapidity of the current."

6337 ILLINOIS & MICHIGAN CANAL COMMISSIONERS' REPORT OF 1900 EMBRACING A DOCUMENTARY HISTORY OF THE ILLINOIS & MICHIGAN CANAL.

This report by the Canal Commissioners is a printed volume of 273 pages.

(THE DESPLAINES RIVER.

Data from the

"DOCUMENTARY HISTORY OF THE ILLINOIS AND MICHIGAN CANAL" PUBLISHED IN THE CANAL COMMISSIONERS' REPORT FOR 1900.

pp. 60-268.

ROUTE OF CANAL.)

From report of J. M. Bucklin, Dec. 18-1830.

6376 "From the mouth of the Chicago river to the point fixed upon as the entrance of the canal, there is no obstruction whatever to its navigation by boats drawing under five feet for that distance, which is five miles, this river forms a perfect natural canal, its banks being low and of uniform heights and its waters supplied by the Lake." (Can. Com. Rep., 1900, p. 73.)

"Leaving the river at the point above mentioned, the line of the canal inclines towards the Regula (as will be seen by a reference to the accompanying map) and follows along the margin of the Portage lake until it strikes the river Des Plaines at the ford, a distance of nine miles; the excavation throughout this distance will pass through a hard ferruginous clay (as has been ascertained by borings) at an average depth of 15.41 feet. From the ford of the Desplaines to the Ausoganashkee swamp, the line runs through the valley of the Des Plaines river, at an average elevation of 16.27 feet above the bottom of the canal. On this part of the route, which is nine miles in length, the excavation to the depth of 6.27 feet is good consisting of sand and clay, but the remaining ten feet composes almost a continuous map of limestone extending with little intermission from the ford of the Des Plaines to the end of the line surveyed, it it probably of the same character as that in the bed of the river, the upper strata only of which appear to be detached." (Can. Com. Rep., 1900, p. 73.)

"The Ausoganashkee or Reed swamp does not present

any insurmountable obstacles to the passage of the canal through it, although with the lake as a feeder, it must necessarily be attended with great expense. The canal is located immediately across its mouth, which is half a mile in breadth, the depth of the excavation rendering
6376a it expedient to select the most direct route. The surface of this swamp is 15.86 feet above the bottom of the canal, 9.80 feet above the level of Lake Michigan and 2.30 feet above the river Des Plaines at its low stage, the excavations through it will consist of 5½ feet of mud and earth and 10.36 feet of rock." (Can. Com. Rep., 1900, p. 74.)

"To carry the canal entirely through the deep cut which terminates about six miles below the Ausoganashkee will probably increase the above amount to two millions and a half, the great expense of time and money thus necessarily incurred in making a feeder of the lake renders it desirable to use for that purpose some stream by which the summit level can be better adapted to the elevation of the ground on the line of the canal. The river Des Plaines when low affords a very considerable quantity of water, but the Calamic river which empties into Lake Michigan about twelve miles south of Chicago, furnishes an abundant supply (320,000 cubic feet per hour) and is in every respect, so far as my observation extends, advantageously situated as a feeder. Too much time was necessarily consumed in the survey of the line of the canal to admit of as particular an examination of this river as from the facts collected respecting it, it undoubtedly deserves." (Can. Com. Rep., p. 74.)

"It is evident from the nature of the ground as well as from the representations of the inhabitants of the country, that there is in times of high water, a communication between the river Des Plaines and Calamic, through the valleys of the Ausoganashkee swamp and Stoney Creek, as neither of these rivers rise more than ten or twelve feet, and as there is no perceptible current between them when both are up, it is reasonable to conclude that the intermediate ground is low enough to admit of the waters of the Calamic being brought into the valley of the Des Plaines at a small expense, provided a dam can be made in the former at a sufficient elevation to give the feeder its proper descent."

THE SECTION OF LANDS UNDER THE U. S. LAND GRANT.

From Reports of ROBERTS, JAYNE AND DUNN, CANAL COMMISSIONERS.

December 27, 1830.

6377a "The commissioners selected each alternate section having an odd number, commencing with township No. 32 north range No. 1 east of the third principal meridian, within five miles of each side of the canal, making in all four hundred and ninety sections." (Can. Com. Rep., p. 76.)

PLATTING OF CHICAGO,

ITS COMMERCIAL IMPORTANCE.

6378 "That means might be realized as early as possible to commence the work of excavation, the commissioners determined to bring into market the remaining canal lands, on the 27th day of September at Chicago, and on the 4th day of October following at the rapids of the Illinois river. In the meantime they laid off into town lots part of section 9, T. No. 39 N., R. 14 E., lying on the Chicago river near Lake Michigan, and part of section No. 11, T. 33, N., R. No. 3 E., situated at the mouth of Fox river on the Illinois." (Can. Com. Rep., 1900, p. 77.)

"A portion of these lots were with the remaining canal lands (except fractional section 15, T. 39 N., R. 14 E.) after public notice given, offered for sale at the times and places specified. The report of the Treasurer before referred to, embraces a satisfactory and detailed account of these sales. The sales of lots in the town of Chicago on section 9, T. 39 N., Range 14 E., amounted to about $4,363 and were so flattering as to inspire the Commissioners with a confident hope that the remaining lots, say about three-fourths, would with proper care and management, yield a very handsome increase to the canal fund. This town is situated on the Chicago river near its mouth and possesses many advantages, natural and advantitious. It is the only eligible site for a town on the lake shore within the limits of Illinois surrounded by a beautiful champaigne fertile country, surpassed by none in the richness of its products and from the long

experience of its inhabitants is decidedly healthy. (Can. Com. Rep., 1900, p. 77.)

Its prominence in a commercial point of view has already prompted merchants from the northeastern part of the State and northwestern part of Indiana to take their produce to Chicago, ship for Detroit, Buffalo and New York and return by the same route, as the safest and cheapest. Saving on the transportation of goods 1.25 per hundred weight and performing the trip ten days sooner than by either of the other channels, through which merchandise is brought into these sections of the two States. The circumstances of Chicago being located at the head of the contemplated canal will make it the future depot of all the surplus products of the country on the Illinois river and its tributaries. These advantages point out its importance and at once elicit the fostering care of the Legislature of this State. Nothing would conduce more to the prosperity of this place than the construction of a safe harbor at the mouth of the Chicago river." (Can. Com. Rep., 1900, p. 77.)

WATER SUPPLY OF RIVERS.

THE DEEP CUT AND SHALLOW CUT.

6378a COST OF CANAL.

"From the estimate embraced in the engineer's report, it will be discovered that the cost of construction of that part of the canal, included within the points mentioned, will exceed one million and a half of dollars. This estimate is founded on the presumption that the water required, say four and a half feet in depth, is to be supplied from the Lake; and that the dimensions of the canal are twenty-six feet in width at bottom, with a slope on the sides (in earth) of one foot and three-quarters base to every foot perpendicular rise. The law on this subject has prescribed that the dimensions of the canal shall be as follows: "At least forty feet in width at the summit water line, twenty-eight feet wide at the bottom and of sufficient depth to contain at least four feet water." The difference in the dimensions assumed by the engineer, for the purposes of calculation, and those

prescribed by law, is so slight that the estimate predicted on the first may be safely relied on as appreciable to the latter." (Can. Com. Rep., 1900, p. 78.)

"The great expense of construction that must be incurred on the plan of using the waters of the lake to supply the summit level induced the commissioners to make such examination and inquiries as time permitted into the practicability of procuring a sufficient supply of water from some other source, that would raise the summit level sufficiently high to avoid rock excavation. It is believed that the river Calamic which emptied into the Lake about twelve miles south of Chicago, furnishes an abundant supply of water (320,000 c. feet per hour) and is in other respects advantageously situated for the purpose. Too much time was necessarily consumed on the canal line to admit of a particular examination of this river during last fall, but the information communicated by the engineer in his report and such observations as the Commissioners have been able to make, convince them of the practicability of the plan of using the Calamic as a feeder." (Can. Com. Rep., 1900, p. 78.)

"When we reflect that the cost of constructing the first eighteen and a half miles of the canal, will not, on this plan exceed $160,000 and that on the other it will amount to more than a million and a half, the reason in favor of using the waters of the Calamic will appear too obvious to require comment. The report of the engineer is referred to for more satisfactory information on this subject." (Can. Com. Rep., 1900, p. 78.)

RAILROAD VS. CANAL.

Act of 1831, Section 2.

6381 "It shall be the duty of the superintending commissioner, to cause the engineer employed by him, to ascertain as early in the spring as the weather will permit, whether the Calamic will be a sufficient feeder for the part of the canal between Chicago and Des Plaines river, "or whether the construction of a railroad is not preferable, or will be of more public utility than a canal." And if the commissioners shall seem satisfied of sufficiency of said river, and that a canal will be of more

public utility than a railroad, it shall be their duty to commence the excavations without delay. And if they should be of opinion that it would not, all further proceedings in relation to said canal and sales of land, shall be deferred until the next meeting of the Legislature." (Can. Com. Rep., 1900, p. 83.)

FROM REPORT OF ACTING COMMISSIONER DUNN.

6382 "The engineer is of the opinion that 'the facts elicited by the examination of the route of the proposed canal are unfavorable to the practicability of its safe and
6382a economical construction.' But represents that the route examined for a railway was found extremely favorable for the adoption of that sort of improvement. These statements of the engineer but confirm a conviction that I had for some time labored under." (Can. Com. Rep., 1900, pp. 85-86.)

FROM REPORT OF CANAL COMMISSIONERS.

RAILROAD VS. CANAL.

"They regret that it is not in their power to make a report in detail. This cannot be looked for from them until they have all the means which the subject is susceptible of furnishing, necessary to satisfy the expectations of the public. They deem it a sufficient reason to say that the engineer in their employment has been constantly and indefatigably engaged in the execution of the work for nearly seven months past, notwithstanding the season were exceedingly unpropitious. But their convictions justify them in stating that the work has been executed with great pains and fidelity and which they think, merits, in reference to its accuracy, the confidence of the country." (Can. Com. Rep., 1900, p. 86.)

"It would be premature in the undersigned to say unqualifiedly that either one of the improvements contemplated should be preferred to the other, without the aid they would derive from the estimates of the cost. But from the convictions that at present influence them, they cannot hesitate to say that a railway on the route

referred to, is decidedly preferable to a canal." (Can. Com. Rep., 1900, p. 86.)

"The maps, profiles and estimates of a railway and canal will be made out by Mr. Bucklin without delay, but which will necessarily, however, occupy some time to enable him to accomplish this part of his labor. But we state it as our present convictions, undecided by his report, that unless there are some facts hereafter presented which we do not now anticipate) we should feel it our duty to recommend to the Legislature the adoption of a railway in preference to a canal." (Can. Com. Rep., 1900, p. 86.)

WATER SUPPLY.

6383a FROM REPORT OF J. M. BUCKLIN, ENGINEER, JAN. 1, 1833.

"The discharge of the Calamic river in the fall of 1830 a season of extreme drouth, amounted to 320,000 cubic feet per hour, which may be safely relied upon as its minimum discharge. This quantity was considered sufficient for the upper portion of the canal, but by the late survey the length of canal to be supplied from the summit until relieved by the river Du Page proving to be much greater than was anticipated, an additional supply of 102,400 cubic feet per hour will be required for its consumption. The river Des Plaines in most seasons would alone make up the deficiency, but in the fall of 1830 its discharge was at one period reduced to 60,000 feet per hour. Relying upon its contributing this quantity of water in the dryest seasons, there will still remain a deficiency of 42,400 cubic feet for which there is no resource but the establishment of an artificial reservoir on the Summit Level. The Ausoganashkee swamp presents great advantages for this purpose, as it receives the drainage of the country to a great extent, and is susceptible at a comparatively small expense, of being rendered more secure from breaches and other casualties than most works of a similar description. It will form an area of 1,194 acres, capable of being filled to the average depth of ten feet and of containing a body of water more than adequate after the deduction of a large allowance for evaporation and leakage to all demands

made upon by the above mentioned deficiency. (Can. Com. Rep., 1900, p. 88.)

"Discharge of the Des Plaines river per hour in cubic feet 60,000."

6384 "The entire length of the canal being 92.75 miles there will then remain 56.25 miles to be supplied from other sources. Forty-one miles of this distance will devolve upon the river Du Page and the remainder upon Fox river. The river Du Page or Tokoquenonc empties into the river Des Plaines 3.67 miles above its junction with the Kankakee. By an imperfect and hasty measurement of the Du Page in the fall of 1830, its minimum discharge was estimated at 415,000 cubic feet per hour, the succeeding summer and fall being remarkably wet did not afford an opportunity of ascertaining its discharge at a low stage, but it is obvious to the observer of both streams, that its discharge must, at all times, be greater than that of the Calamic. We may rely upon its capacity to furnish the same quantity of water, that is, 320,000 cubic feet per hour, from which deduct 246,000 cubic feet, the quantity required for evaporation and leakage in forty-one miles of canal at 6,000 cubic feet per hour for every mile, and there will remain a surplus of 74,000 cubic feet per hour, which being insufficient for the consumption of the remaining 15.25 miles, the waters of Fox river can be brought into requisition to supply the deficiency. As far as the results of experience can be applied in calculating the quantity of water expended by a canal located on ground of ordinary permeability, an ample supply of water is thus provided for the whole route. Nevertheless it must be acknowledged that in the upper levels where from the scarcity of water it is most important to restrict the loss of water within the usual limits, the canal passes through so rocky and porous a section of country that it is impossible to anticipate what may be the extent of the leakage or how far the precautions ordinarily adopted may succeed in enabling the canal to retain the water." (Can. Com. Rep., 1900, p. 89.)

RAILWAY AND CANAL IN DES PLAINES VALLEY.

"Resuming the survey of 1830, at the Ausoganashkee swamp the line of the late survey continues in the south-

east valley of the river Des Plaines until within half a mile of Hickory Creek, it then crosses the river and encroaching upon its bed for a short distance to avoid rock excavation, is conducted by means of a narrow valley to Mount Joliet, where it falls in with the line of railway and terminates the second division, a distance of 19.75 miles. The rock excavation which forms a large item in the cost of this division, is occasioned by the gradual rise of the rock on the summit level, and the difficulty in procuring earth from embankment on the lower levels, which in some instances renders a depression of the level and the consequent excavation of the rock more advantageous than a continuation of the level and the
6384a substitution of embankment, although under the circumstances it would be preferable. The broad valley of this singular stream in places where it has much descent seems in its whole extent (far beyond the present rise of its waters) to have been swept bare of everything that was not sufficiently ponderous to resist the effects of a violent current. In these situations with the exception of occasional mounds of gravel, materials for embankment cannot be found within a distance that would justify their use except in a case of absolute necessity. Besides the expense accruing from these causes, the cost of keeping this part of the canal in repair after it is finished, must be necessarily great on account of the immense deposits of earth and the breaches to which it will be annually subjected by the numerous small streams which intersect the route and must be received into the canal as they cannot be passed under it or disposed of in any other way. The whole line is more or less exposed to this defect, but it is of more frequent occurrence in this division than in any other part of it. It is here that the rocky district of the country before alluded to, as exciting so much apprehension respecting its probable effect in exhausting the supply of water is situated. (Can. Com. Rep., 1900, p. 90.)

"The third division which is included between Mount Joliet and the river Au Sable (a distance of 15.234 miles) affords a better location than the preceding. With the valley of the Des Plaines it pursues on very favorable ground, a southerly course from Mount Joliet to the river Du Page which it crosses some distance above its mouth, receiving a feeder from it on the north side. Beyond

this point, the bluffs, just above the confluence of the Kankakee and Des Plaines rivers oppose serious obstacles to the construction of an economical and permanent work. On this section of the division the level is unavoidably too low to admit of the passage of many of the small streams under the canal by which means and the drainage from the hills, it will be subject to the same inconveniences and danger in wet seasons to which the division above is exposed. The soil also from being mixed with sand adheres together very slightly and when saturated with water has a great tendency to slip over where the inclination of the hill is moderate. Considerable embarrassment to the navigation of the canal may be expected from this cause besides the expense of repairs." (Can. Com. Rep., 1900, p. 90.)

DEEP CUT PLAN

ROCK EXCAVATION

USE OF DES PLAINES.

6385 "In making a feeder of Lake Michigan, by cutting through the dividing ridge between the lake and the head waters of the Illinois river the location of the canal is the same throughout as the foregoing, it being important in both plans to choose the lowest ground for the Summit Level, the arrangement of the lower levels being governed by the same indications in each. In the survey of 1830 of the upper part of the route, assuming the bottom of the canal at the head of the Chicago river, to be four and one-half feet below the level of the lake, no rock excavation is encountered until the line strikes the river Des Plaines, where it was ascertained by the boring to average about ten feet and the earth excavation about six feet in depth throughout the remaining distance of nine miles. By the late survey, beyond the Ausoganashkee Swamp, the rock excavation was found to increase in depth for several miles, on account of the greater elevations of the rock which I have before had occasion to advert to in describing the location of the second division. The divisions of the route upon this plan, are the same as in the former, of which first and second division it will be observed by referring to the

estimates, are liable to any increase in the cost of construction, arising from the difference of plan, yet this increase amounts to upwards of two millions and a half, a fact that may be thought sufficient of itself to put the execution of the work on this plan entirely out of the question. Still it may not be superfluous to remark that although in the estimate of the probable cost of the work, a liberal place is allowed for the rock excavation, the most important item; besides a sum amply sufficient to cover the ordinary contingent expenses, yet it is hardly possible to anticipate the limits of the expenditure when we consider that the bulk of the rock excavation lies below the rocky bed of the river Des Plaines and the interruption that the work will consequently be liable to form the water of the river finding its way through the numerous fissures of the rock into the canal." (Can. Com. Rep., 1900, p. 91.)

DES PLAINES RIVER—WHY NOT USED FOR CANAL—RAILROAD PREFERRED.

"It has been also proposed to effect a water communication between the Lake and the Illinois river by means of dams and locks in the river Des Plaines, forming a still water navigation, knowing the minimum discharge of this river, the impracticability of the scheme is so evident that the subject is here noticed more as a mat-
6385a ter of form, than with any expectation of rendering it clearer. It will be recollected that the quantity of water provided for the passage of 96 boats over the Summit Level every 24 hours in the canal, is 86,400 cubic feet per hour, that is one lock chamber full of water every 15 minutes, ascending and descending." (Can. Com. Rep., 1900, p. 92.)

"The minimum discharge of the river Des Plaines, is only 60,000 cubic feet per hour. Of course, it is not competent to supply even the lockage (which on this plan cannot be less than that required for the canal) without taking into consideration the loss by evaporation and leakage, which would alone consume at least seven times the quantity of water discharged by the river Des Plaines at its lowest stage." (Can. Com. Rep., 1900, p. 92.)

ANY WATER COMMUNICATION WHATEVER THOUGHT IMPRACTIBABLE.

"In the rocky and cavernous district of country to which the location of the great part of the route of the canal is confined, there are too many difficulties to be reasonably apprehended in carrying it into successful operation, to justify the establishment of a water communication on any route or plan whatever, while however, so many obstacles are opposed to the construction of a canal, the examination of the route for a railway was very successful in developing its great advantages for the adoption of that species of improvement. The line of the canal commencing at the Chicago river and occupying the south bank of the river Des Plaines, being of very exceptional character for a railway, and the inclination of the grades of the latter admitting of greater latitude in its location, the route for a railroad was commenced at the junction of the north and south forks of the Chicago river in the town of Chicago on Lake Michigan, and from thence run in a sight line through a level open prairie, north of the Portage Lake to the upper ford of the river Des Plaines, commonly called Laughton's ford, a distance of ten miles from Chicago; it crosses the river at this point which is advantageously situated for that purpose, and pursues the northwest valley of the river Des Plaines until it forms a junction with the line run for a canal, a short distance below a remarkable natural mound called Mound Joliet, 38.258 miles from Chicago. This distance includes the 1st and 2nd divisions of the line of the railway, the remaining part of the route (57.742 miles) corresponds in the limits of its division with those of the canal, although the location is not entirely the same, the inclinations of the railway frequently allowing a better selection of ground than that to which the levels of the canal are confined." (Can. Com. Rep., 1900, p. 92.)

"The graduation of the first ten miles through the Chicago prairie, generally conforms to the surface of the ground which varies in its inclination from 2 to 13 feet to the mile. The want of stone and timber which

exists on this part of the line can in a great measure be obviated by commencing the construction of the railway at the river Des Plaines, where these materials can be obtained in abundance, stone or a very good quality. The estimates of the probable cost of this section of the 1st division are founded upon the adoption of this expedient for lessening the cost of the transportation of materials. Beyond the river Des Plaines, the 1st division extends to Flag Creek which empties into it 9.618 miles below the upper ford. The ground upon which this part of the line is located, is generally very level, the graduation which does not require much excavation or embankment, not exceeding 13 feet to the mile. Curves are, however, frequent, but not very abrupt, the minimum radius of curvature being 955 feet. Materials are found in sufficient quantity in the vicinity of the line." (Can. Com. Rep., p. 92.)

"Crossing the above mentioned creek obliquely about a mile and a half above its mouth, the line of the railway descends the valley of the creek to that of the river Des Plaines, where it continues its course until it strikes a succession of swamps, occupying the whole breadth of the valley of the river and running nearly to the top of the bluff. They are about two miles in extent, but from the favorable circumstance of their being generally shallow with a rock foundation, no great difficulty of expense is anticipated in passing them by an embankment. The line as first run, in order to avoid them as much as possible and to obtain firm ground, ascends the side of the bluff which involves the necessity of a graduation of 24 and 31 feet to the mile, but as the survey of the entire line has developed the fact that 20 feet to the mile may be considered the maximum rate of graduation on every other part of the route it becomes necessary even at a great increase of cost to equalize the graduation at this point. For whatever propelling power is used on the road it will, of course, be calculated to overcome the greatest resistance to be met with on any part of the road, consequently it is of great importance to avoid the necessity of providing a propelling power to overcome an ascent of 31 feet to the mile at one point only, while on no other part of the route a greater power is required

than that necessary for an ascent of 20 feet to the mile." (Can. Com. Rep., p. 93.)

6387 "In reviewing the capabilities of the country between Chicago and the foot of the rapids of the Illinois river for the construction of a canal or railroad, it would seem (laying aside the great difference of expense) that the obstacles opposed by nature to the foundation of a good canal on any route or plan whatever, are such that nothing could justify the undertaking, but the fact of its being the only means of attaining the accomplishment of so important an object as the improvement of the communication between the above mentioned points. For this reason the unparalleled advantages presented on the route of the railway for the construction of a very perfect and prominent work, are invested with additional value in inviting the adoption of an alternative, the ultimate success of which is warranted by experience in the successful operation of many similar works both in Europe and the United States, none of which can compete with it in economy of construction or perfection when finished." (Can. Com. Rep., 1900, p. 95.)

Effects of the Railroad Scheme

Canal Commissioners Abolished

Memorial to Congress by State Legislature

6391a An Act to Abolish the Office of Canal Commissioners. Approved March 1, 1833.

"The General Assembly of the State of Illinois in session December 20th, 1832, adopted the following memorial:

"To the Honorable, the Senate and House of Representatives of the United States in Congress Assembled:

"The memorial of the General Assembly of the State of Illinois, respectfully represents, that by 'An act entitled an act to grant a quantity of land to the State of Illinois for the purpose of aiding in opening a canal to connect the waters of the Illinois river with those of Lake Michigan, approved March 2d, 1827,' Congress

has granted to this State a quantity of land, on the line of the proposed canal, to assist in the accomplishment of the work. Since the passage of this law, the State has caused the route to be surveyed, and the cost of the work to be estimated, from which it appears that the expense will greatly exceed the amount originally contemplated; that a railroad or turn-pike will be, upon the whole, more useful and less expensive, and can be accomplished in much less time. Nevertheless, the act of Congress limits the donation to the purpose of making a canal so as to restrict the Legislature from making any other application of it. Your memorialists therefore pray your honorable body to pass an act enabling this State to apply this donation to a turnpike, railroad or canal, as either of them shall be found to be most advantageous or convenient." (Can. Com. Rep., 1900, p. 104.)

From Act of Congress Approved March 2, 1833.

"Provided, That if a railroad is made in place of a
6392 canal, the State of Illinois shall be subject to the same duties and obligations, and the government of the United States shall be entitled to, and have the same privileges on said railroad, which they would have had through the canal, if it had been opened." (Can. Com. Rep., 1900, p. 105.)

"Approved March 2, 1833."

"In January, 1835, the General Assembly of Illinois passed an act entitled 'An act for the construction of the Illinois and Michigan Canal.' Under this act Governor Joseph Duncan nominated Edward Coles, president; Gurdon S. Hubbard, Joel Manning, William Linn, and William B. Archer, commissioners, who were duly confirmed as the Board of Canal Commissioners. This act, however, proved defective in so many particulars that nothing was accomplished by this commission." (Can. Com. Rep., 1900, p. 105.)

"From 1831 to 1835 a strong effort was made to secure the construction of a railroad instead of a canal. This effort, however, while it was advocated by many of the leading men of the State, met with little encourage-

ment from the people." (Can. Com. Rep., 1900, p. 105.)

"The Congressional acts of 1827 and 1833 extended the time limit for commencing the canal to 1837 and for its completion to 1852, it being apparent at this time that prompt measures must be taken for the commencement of the canal or the rights under the act of 1822 and 1827 be lost and the land grant of 1827 thereby revert to the general government; that the Governor of Illinois by proclamation convened the General Assembly in special session December 7, 1835.

A CONTINUOUS CANAL AS AGAINST SHORT CANALS AND RIVER IMPROVEMENT.

6394 "Chicago, June 23, 1836.

To the Honorable, The Canal Commissioners of the State of Illinois.

Gentlemen:—

At a meeting of the citizens of the town of Ottawa the undersigned were appointed a committee to address a note to your board to ascertain whether it is contemplated by you to cause a survey of the Illinois river or any part of it to be made, in order that estimates may be made with a view to its ultimate improvement for slack water navigation." (Can. Com. Rep., 1900, p. 109.)

PRESIDENT TO CITIZENS OF OTTAWA.

Canal Office, Chicago, July 11, 1836.

Committee of the Citizens of Ottawa.

Gentlemen:—

Your communication of the 23d ult., was laid before the board of canal commissioners at their first full session, after the receipt of it, and I hasten to apprise you of the result. You inquire 'whether it is contemplated by the board to cause a survey of the Illinois river, or any part of it, to be made with a view of its ultimate improvement for slack water navigation,' and we presume that you allude more especially to that part of the river lying between Ottawa and the western boundary of the canal lands."

"By reference to the 44th section of the act for the construction of the Illinois and Michigan canal approved the 9th of January, 1836, it will be seen that the Legislature have ordered the canal to terminate "at or near the mouth of the Little Vermillion river, in Lasalle country, and on lands owned by the State."

"When this act was passed, the question was not new, whether a continuation of the canal or an improvement of the river below Ottawa by lock and dam was most advantageous to the general interest. The Legislature had accumulated a large fund of information in order to judge of the comparative advantages and disadvantages of each plan, both in relation to the safety and stability of navigation, and to the increased revenue derivable from State property by terminating the canal as low down the river as was contemplated in the grant of lands from the Government of the United States. Nor can it be doubted that the tenor of that grant had some influence on the decision." (Can. Com. Rep., 1900, p. 109.)

6394a "The commissioners shall have power, says the law, to cause an engineer to examine the Illinois River, from the mouth of Fox river, down to the head of steamboat navigation; and if, in their opinion the navigation of the Illinois can be improved by locks and dams, or otherwise, so as to secure its navigation as far upward as the mouth of Fox river, with as little expense and as much utility as cannalling from the Fox river to the Little Vermillion or the foot of the rapids, they shall have power to terminate said canal at mouth of Fox river." In 1833, the same engineer reported that a comparatively good route could be obtained for the continuation of the canal from the mouth of Fox river to a place now known as Utica and that great difficulty and expense would attend a further progress. In examining the rapids of the Illinois below the mouth of Fox river he says,

"It was ascertained that the establishment of a still water navigation was the most certain and effectual method of improving them." But in his zeal to demonstrate the superiority of a railroad over either mode of water communication, he admitted a steamboat canal around the rapids, "to be of too precarious a nature to be recommended with any degree of confidence in

its permanency and usefulness." He estimated an independent canal between Fox river and Utica at $580,000; and a still water navigation of the same distance at $200,000; and it is worthy of remark that notwithstanding this great disparity of cost necessarily enhanced by the difficult country between Utica and the mouth of the Little Vermillion, the Legislature have thought proper to repeal the eighth section, just cited, and to adhere to the first plan. In fact, they have presented the termini in language not to be misunderstood, while they have given great latitude and almost everything else connected with the subject, hence the commissioners deem themselves unauthorized at this time to cause a survey of the rapids of the Illinois river" "with a view of their ultimate improvement for slack water navigation"; nor would they be justified to any premeditated suspension of that particular line for the sole purpose of bringing the matter again before the Legislature, unless the engineers (who have recently ascertained that a safe canal and suitable termination are entirely practicable) should prove by their estimates that the cost will so far exceed any previous calculations as to render it prudent, on the part of the commissioners, to report that fact to the Governor and pause for additional legislation." (Can. Com. Rep., 1900, p. 110.)

6395 "Taking this view of the subject, the commissioners can make no pledge " 'To cause any part of the river to be surveyed, with a view of slack water navigation,' except in the contingency before mentioned or, in the further one, of the Fox river feeder, and the division along the Rapids not being not under contract during the present season. Should either of those events take place, an accurate survey from Ottawa down will be made this fall when the water is low, and plans and estimates submitted to the Legislature." (Can. Com. Rep., 1900, p. 111.)

"In coming to this conclusion, the board of commissioners are influenced, in the first case, by the consideration that if a continuous canal should be shown to be too costly for its benefits, a still water navigation will be the only alternative; and in the second case, by their anxiety to do everything consistent with their duty, to promote the interest and gratify the wishes of the enterprising citizens of so important a town as Ottawa. A

point in which the State is deeply concerned and one which, in no event, can fail to arrive at immense consequence." (Can. Com. Rep., 1900, p. 111.)

"With great respect, gentlemen, I remain,

Your obt. servt.

W. F. THORNTON,

President Board Comms. I. and M. Canal.

(Can. Com. Rep., 1900, p. 111.)

FROM ANNUAL REPORT FOR 1836.

6396 "In the very threshold of their administration, the board were met by appalling difficulties, involving the highest official responsibility, and the most vital interests of the State. They soon became convinced that the magnitude of the undertaking had been miscomprehended both by the Legislature and the people. The largest estimate that had been previously made was about four millions of dollars; and without regarding the enlargement of the plan or the increased value of the means of execution, it was confidently asserted by many members of the Legislature and other citizens, whose opinions were entitled to weight, that even that estimate was far beyond the truth."

"The commissioners had just begun their inquiries when they became satisfied that the four millions would be wholly inadequate; and before they had determined on any definite location, they saw that if the spirit of the law was adhered to, double that sum would be required. The seventeenth section of the act says that "the canal shall be supplied with water from Lake Michigan, and such other sources as the commissioners may think proper." In other words, Lake Michigan must be a feeder; and consequently the water of the lake must be

carried into the valley of the Des Plaines by a through cut, chiefly in stone, of eighteen feet deep, on an average and nearly thirty miles long. It was upon this plan that Mr. Bucklin made his four million estimate; but his canal was to be forty feet wide at the surface, twenty-eight feet base, and four feet deep; while the present law requires "not less than forty-five feet of water surface, thirty feet base, and a sufficient depth to insure a navigation of four feet." It is to be constructed, too, in the manner best calculated to promote the permanent interest of the country, and a discretionary reservation is authorized on each margin with a view to future enlargement." (Can. Com. Rep., 1900, p. 113.)

"To the difficulty which this view of the subject presented, another was added which exercised a strong influence on the movements of the board. It was at first believed by men of experience, and countenanced by the engineer, that steam power would have been freely resorted to in order to divest the Summit level works from the water which might probably flow in through the fissures of the rocks; and that the necessity of such a resort would not only increase the expense of excavation, but deter contractors from making acceptable proposals. Under the circumstances, the board came to
6396a the conclusion that if it were practicable to obtain ample feeders from other sources than the lake, they would direct their operations for the present year to some other division of the work and call the attention of the Legislature to a change of plan. The Calumet and the Des Plaines having been ascertained to be insufficient, the upper region of the Fox river, as the only remaining chance, was ordered to be examined; but after a brief, yet convincing, investigation, the project was abandoned. A reference to the engineer's report will afford all the particulars of the exploration. (Can. Com. Rep., 1900, p. 114.)

"Nothing now remained but to go through the Summit level, or suspend the whole work. (Can. Com. Rep., 1900, p. 114.)

"The next question to be decided was the size of the canal. After mature deliberation the board determined to adopt the recommendation of the chief engineer, and construct it of the following dimensions, to-wit: Sixty feet wide at the top water line, thirty-six feet wide at

the bottom and six feet deep. The fluctuation, or irregular tides, in the lake, occasioned by the action of high winds rendered the depth agreed upon indispensably necessary to insure a navigation of at least four feet, and the commissioners were decidedly and unanimously of the opinion that the adopted width was that "best-calculated to promote the permanent interest of the country."

* * * * *

"There is no avoiding the stupendous cost through the Summit Level. Water must be drawn from Lake Michigan and that water will be of great value, as well for the improvement of the river navigation as for hydraulic purposes. The greater size of the canal will facilitate the passage of canal boats, overcome their burden and cheapen freights. It must have, too, a beneficial effect upon the prices of land and town lots owned by the State; such an effect, in fact, was clearly perceptible at the recent sales in Chicago, and will doubtless be felt at every other point." (Can. Com. Rep., 1900, p. 114.)

THE MACADAM AND PLANK ROAD ACROSS THE SWAMP FROM JOLIET TO CHICAGO.

6398a "But the heaviest item in the contingent account is the Saganashkee road, amounting to $..... At the very commencement of operations it became evident to the board, that, owing to the total absence of a road along the route of the canal, which passes, for several miles, through marshy wet prairie, and heavy timber, some steps must be taken to secure free access to the line, at all seasons of the year. Without it, hardships would at times, be much retarded, and contractors would naturally seek to indemnify themselves by increased prices. At the instance of the acting commissioner he was therefore authorized to make such improvements as, in his opinion, were indispensably necessary. It was believed at that time, that five or six thousand dollars would accomplish the object; but the plan was afterwards extended to its present condition and cost upon the individual responsibility of the acting commissioner. He was confident that a proper discharge of his duty, as the immediate superintendent of the canal, warranted

the expenditures; and the other members were unwilling to withhold the means which the nineteenth section of the law would seem to sanction. The board is unanimous, however, in opinion, that the State will eventually be more than reimbursed by the advantages derivable from so useful a highway." (Can. Com. Rep., 1900, p. 118.)

FROM REPORT OF CHIEF ENGINEER WM. GOODING, Dec., 1836, EFFECT OF CANAL ON THE RESERVOIRS FEEDING THE DES PLAINES.

6399 "Two lines of levels were run across the country lying between Chicago and the Des Plaines river, near the mouth of Portage or Mud Lake, the one commencing near the mouth of a broad slough, on the north fork of the south branch of Chicago river, at the point where the former canal surveys were commenced, the other on the north branch of said river and a half mile above the point or the junction of the north and south branches." (Can. Com. Rep., 1900, p. 119.)

"The former line or the route of the old surveys was found to be far the most favorable, the distance for which the through cut would have to be made, and the depth of cutting being much less. This line passes over the ground but little elevated above the surface of Portage lake at an ordinary stage of water, and which is mostly inundated during the floods of the Des Plaines, the waters of which, it is well known, frequently flows across this low country into the south branch of Chicago river. A particular examination was also made of Portage lake and of the Des Plaines river with the view of occupying portions of each with the canal should the result prove favorable. But it was found that no saving could be effected by such an arrangement. Portage lake is a succession of ponds on the same level, connected with each other and with the Des Plaines river, and extending about six miles toward Chicago river, nearly in the direction of the canal line. The surface of the water at an ordinary stage is 10½ feet above Lake Michigan and the mud in the bottom is generally found 5 to 6 feet above Lake Michigan or from 11 to 12 feet above bottom of canal. To excavate the canal to the requisite depth

through these ponds and the marshes on their borders, would be attended with great difficulty and a cost far exceeding that of making the through cut along the borders of the marshes on ground more favorable."

"The examination of the Des Plaines river resulted no less unfavorable than that of Portage lake. The bed of this stream for 13½ miles below the point where the canal line enters the valley, except in a few places and for short distances only, is from 8 to 12 feet above bottom of canal, and nothing whatever could be gained by occupying any portion of the channel, as the difficulty of disposing of or keeping out the waters of the river to make the necessary excavation would more than balance the diminution of the quantity to be excavated by such a location." (Can. Com. Rep., 1900, p. 119.)

6399a "From the examinations made it soon became apparent that the Summit division was likely to prove far more expensive than any former estimate had made it, and it was believed that if a permanent and adequate supply of water could be provided without cutting down the Summit so as to introduce the waters of Lake Michigan, a change in the existing law should be recommended to the legislature of this State at its next session." (Can. Com. Rep., 1900, p. 120.)

SUMMIT DIVISION.

6400 "This division extends from the north fork of the south branch of Chicago creek to the first lock and is also made to include the creek or river section of five miles and 44 58-100 chains in length. The length of the river section is computed from the pier at the mouth of the river to the commencement of the through cut at "the mouth of the broad slough" on the north fork of the south branch on the line as located for the June letting. Towing path, however, is only estimated from the point on the junction of the north and south branches, and will be constructed on the south side of the south branch four miles and sixty-four chains, where it will cross by a towing path bridge at the mouth of the north fork, up which it will continue to the mouth of the slough before mentioned. Little expense will be required except for the towing path until the south branch is crossed, when it

will become necessary to cut off some points, and in some places to deepen the channel between the mouth of the north fork and the commencement of the through cut." (Can. Com. Rep., 1900, p. 121.)

"But the law requires that the canal should commence on canal land, and if the branch thus improved be not considered canal, it will be necessary to continue the through cut to the south branch, increasing the length of independent canal forty-eight chains or otherwise the law should be so changed as to permit the most judicious location practicable, which is believed to be on the route first described. A survey has, however, been made in pursuance of instructions received, from a point on the south branch 4½ chains above the crossing proposed at the mouth of the north fork to a point near the Des Plaines river where the line first run, and upon which the estimates were made for the June letting, is intersected. Both these lines from the point of starting to the intersection, are straight and occupy similar ground. Upon the first route to the straight line is 7½ miles in length, and upon the other route eight miles and eight chains." (Can. Com. Rep., 1900, p. 121.)

"The prairie over which both lines pass is very level, and extremely wet except in times of severe drought. The cutting is generally from seventeen to nineteen feet, through a stiff blue clay."

"Below the intersection of the tow lines the canal route is down the valley of the Des Plaines. This river for thirteen or fourteen miles has very little descent, the current at low water being scarcely perceptible, and the land so low along its borders as to be overflowed by every rise of water."

"After the line enters the valley the direction is changed by a gentle curve and another straight line obtained of three miles and fifty chains in length. Several other long straight lines are obtained on this division and the curves may all be gentle and uniform."

"The depth of cutting continues about the same down the valley to Brewer's ford as across the wet prairie from Chicago river to the Des Plaines, but the canal will be much more expensive as the excavation is principally rock. The depth of earth on the rock above the mouth of the Saganaskee swamp was found to be much less than was anticipated and less than was represented

in Mr. Bucklin's report but he may have found a more favorable line than that upon which our examinations have been made."

"A different section of canal is presented in crossing the mouth of the Saganskee swamp where there is earth to a depth of five or six feet the most of which is a semi-fluid resting on rock. The cutting is here about seventeen feet." (Can. Com. Rep., 1900, p. 121.)

"From this point to the first lock the rock is generally near the surface and a definite location has been made which it is believed is susceptible of little improvement. The level runs out a short distance after crossing Big Run which is about 1¼ miles above the first lock and in the bed of which the cutting is two feet. This must, of course, be taken into the canal. (Can. Com. Rep., 1900, p. 121.)

6400a "No estimate has been made for cutting down the towing path as the whole drainage of a considerable extent of country on the southeast side of the canal must be received into it, and it was believed that this would sometime be nearly filled so that a towing path below the surface would be useless." (Can. Com. Rep., 1900, p. 122.)

THE DUPAGE-DRESDEN SECTION.

NATURE OF THE CONSTRUCTION.

ENGINEER GOODING'S SUGGESTION THAT THE RIVER BE USED.

6401a "About two miles below the crossing of the Du Page a very difficult and expensive portion of the line commences and extends nearly to Dresden, below the mouth of the Kankakee river. The bluffs which are from 100 to 150 feet in height approach the river so as to be washed by it at their base, and the towing path bank which will be partly or wholly built in the river at the base of the bluffs will require slope wall to protect it against abrasion from the flood waters of the river, for an aggregate distance of 2 miles and 50 chains." (Can. Com. Rep., 1900, p. 124.)

"The most expensive portion of this difficult section commences a short distance above the mouth of the Kan-

kakee river, and continues to the termination of the bluffs. The base of the towing path will be wholly in the river, and the embankment must be formed by earth taken either from the top of the bluff or from the opposite side of the bluff, for the excavation of any portion of the prison of canal in the bluff would increase its tendency to slip and consequently endanger the canal." (Can. Com. Rep., 1900, p. 124.)

"Heavy protection wall will here be required to resist the force of the ice floods of the Kankakee, but it is believed that the estimate of cost presented is sufficient to construct a canal as permanent as it can well be made along clay bluffs which seem so much inclined to slip."

"Another mode of passing the bluffs may be worthy of examination before a final location is made of this part of the line between Dresden and Marseilles."

"A dam may be built at the foot of the bluffs and a towing path constructed along their base so as to pass this difficult portion of the line by slack water at much less expense than the present estimate of an independent canal, and would, undoubtedly, be quite as secure an improvement. By raising the water 15 feet (and a dam of this height can be rendered perfectly secure for there is a good rock foundation) the line would be thrown 10½ feet lower than the survey made to lock No. 8, of 8 feet lift between the Aux Sable river and Nettle creek, and 2½ feet lower than the line surveyed from this lock to locks Nos. 9 and 10, short distance above Marseilles. This would involve the necessity of a change in the plan of crossing the Aux Sable, an aqueduct having been estimated and a dam being required, if the plan suggested hereafter be adopted, and the river would be crossed considerably further down. The line below Dresden would probably be rendered more expensive than it is shown by the present estimate, and some damage would be sustained by the overflowing of land about the mouth of the Du Page, but how extensive this damage would be, how much expense would be saved at the bluffs, and how much additional cost encountered below, are all matters of future investigation." (Can. Com. Rep., 1900, p. 124.)

6402a LOCATION OF WESTERN TERMINAL.

"The termination of the canal is made on the corner of section 21 in township 33, N. R. 1 east of the 3d principal meridian. (Can. Com. Rep., 1900, p. 126.)

HOW ENGINEER GOODING'S SUGGESTION WAS ACTED ON.
6406 SHALLOW CUT HIGH LEVEL WITH RIVER FEEDERS.

"This communication and the reports of the canal Commissioners and their engineer were referred to the committee on canal and canal lands, who on the 15th day of February, 1837, submitted the following report:"

"The committee on canal and canal lands, to which was referred the message of the Governor transmitting the annual report of the canal Commissioners; also a report of the committee on roads and canals of the House of Representatives, have had the various matters submitted to them under consideration, and submit the following as the result of their deliberations."

"From the examinations of those documents it will be seen, that the questions presented for consideration naturally bring before the committee inquiries touching the whole course of many years' legislation upon the subject of the canal. Questions which ought long since to have been investigated and definitely settled, and which it must be presumed have been fully considered and decided upon by previous legislative bodies, are again presented with the view of an almost entire change and total reversion of all previous legislative action. The committee have not thought proper to assume the correctness of the policy and measures heretofore adopted without investigating the facts and reasons urged in favor of the change. In proceeding to the investigation of this subject, the committee will endeavor to divest themselves of all prejudice in favor of preconceived opinions, growing out of previous action in their legislative capacity upon the same subject. It is deemed proper, however, to state that in the opinion of the committee it is incumbent upon those urging and proposing changes of action upon a subject of such vast importance to show that such changes are practicable, and are consistent with the public faith, and the character and dig-

nity of the State. The first change proposed by the committee of the House is upon the Summit division of the canal line, thirty-two miles in extent." (Can. Com. Rep., 1900, p. 133.)

(1) Shallow Cut High Level With River Feeders.

"The proposition is to adopt the high level, as run by Mr. Bucklin, ten feet above the surface of Lake Michigan using the Calamic and Desplaines rivers for feeders."

---

(2) Improvement of Illinois River to Head of Lake Joliet.

"The second is, to substitute the improvement of the Illinois river, from the foot of the rapids to the head of Lake Joliet, for steam navigation by means of locks and dams." (Can. Com. Rep., 1900, p. 133.)

Discussion of High Level Feeder Proposition.

"The reasons urged by the committee of the House in favor of the first changes proposed are: First, the large sum which the canal will cost upon the present plan; secondly, the length of time required for its completion; third, the difficulties of construction; and fourth, that a better plan can be adopted."

"All of these reasons except the last strike at the root of the project, and have been often urged against the policy of engaging in a work of such magnitude, and it is to be regretted that the committee did not turn its attention more particularly to the last reason, because, unless it can be made to appear that the change proposed by the committee is practicable, the arguments with reference to cost, to time and to difficulties of construction, must have their full weight against proceeding further with the canal." (Can. Com. Rep., 1900, p. 133.)

"If the fact can be established, that a canal much less expensive, equally ample, and securing all the advantages and acommodations which could be obtained from the deep cutting, can be constructed upon the plan pro-
6406a posed by the committee of the House, there will be no ground or point left for disputation. No citizen of Illi-

nois would be found contending against the adoption of such a plan. If, on the contrary, the plan proposed is impracticable, no one desiring the completion of the canal would be willing to abandon the present plan for such reasons as are urged against it." (Can. Com. Rep., 1900, p. 134.)

EFFECT OF LOCAL INTERESTS.

"It is a source of deep regret that local and sectional interests of recent origin, should be made to operate upon a question of such vital importance to the character, dignity and faith of the State. A spirit of rivalry is perhaps inseparable from the existence of towns and villages, whose inhabitants imagine that the prosperity of one would be the downfall of the others. Yet whenever such a spirit shall attempt to exert an influence upon legislative action, upon measures involving both State and National policy, it ought to be met by the representatives of the people with the requisite firmness to destroy its influence, and put to shame those who have attempted to use it." (Can. Com. Rep., 1900, p. 134.)

SENATE COMMITTEE'S SUMMARY OF FORMER HISTORY (in 1837).

"In the examination of the questions now under consideration, the committee will first review the legislative action bearing upon this point. In 1823 an act was passed organizing a board of commissioners to consider, devise and adopt the measures requisite to effect the communication by canal and locks between the navigable waters of the Illinois river and Lake Michigan. Five distinguished citizens of the State were constituted the board. An examination and survey were executed under their direction by Messrs. Paul and Post, both of whom stood high as men of science, talents and integrity." (Can. Com. Rep., 1900, p. 134.)

"In January, 1829, an act was passed by which a board of canal commissioners was organized, who were required to locate the canal to effect a navigable communication between Lake Michigan and the Illinois river. The canal to be at least 40 feet in width at the summit of the water line, 28 feet wide at the bottom,

and of sufficient depth to contain at least 4 feet of water; and to be furnished with such locks, aqueducts and dams, as might be required to secure a safe and convenient navigation for boats at least 75 feet long, 13½ feet wide and drawing 3 feet of water. No point is fixed in either of those acts for the termination or commencement of the canal; nor was any direction given as to the waters to be used for feeders. (Can. Com. Rep., 1900, p. 134.)

"In 1831 the last act referred to was amended, and an examination was required to be made of the Illinois river, from the mouth of Fox river down to the head of steamboat navigation, with the view of ascertaining whether the Illinois river could be improved by dams and locks, or otherwise, so as to secure its navigation as far upwards as the mouth of Fox river. An examination was also required of the Calamic river to ascertain its probable sufficiency as a feeder for that part of a canal between the Chicago and Des Plaines rivers. In 1832-3, after an ineffectual attempt to change the character of the improvement, from a canal to that of a railway, the board of canal commissioners was abolished, and all further progress of the work suspended. In 1834-5, another act was passed which provided that the canal shall not be less than 45 feet wide at the surface, 30 feet at the base and of sufficient depth to insure a navigation of at least 4 feet, to be suited for ordinary canal boat navigation, to be supplied with water from Lake Michigan and such other sources as the canal commissioners may think proper. No point of termination was fixed by this act. The act of 9th January, 1836, under which the late canal commissioners acted, provides that the canal shall commence at or near the town of Chicago, on canal lands, and shall terminate near the mouth of the Little Vermilion river, in La Salle county, and on land owned by the State. These acts of the Legislature, are referred to, in order to present before the Senate, in one view, the real points in controversy, and to show the reasons upon which the opinion is expressed, that those who propose changes in the action of the Legislature, are bound to show that such changes are practicable, and consistent with proper regard to the interest of the State. It may here be remarked, that an examination of the various laws will

show that the provisions upon the point under consideration *were not adopted by accident and without design.* The committee of the House in order to prove the practicability of the change proposed, have made calculations as to the quantity of water required to sup-
6407 ply such a canal as is proposed to be constructed, and at page 19 of their report say: 'You committee feel assured that not only a sufficient quantity of water for all the purposes of the canal can be procured from these two sources (the Calamic and Des Plaines) but that a large surplus will still remain." (Can. Com. Rep., 1900, p. 134-5.)

THE SENATE COMMITTEE LEAVE IT TO MR. BUCKLIN.

"No member of your committee having sufficient knowledge of the science of engineering to risk his own judgment upon this question in opposition to the published opinions of gentlemen of acknowledged scientific information, they are compelled to rely upon the opinions of others, in whose judgment they have confidence. Mr. Bucklin, well known to the public, having recently arrived at this place, the chairman of the committee addressed a note to him which together with the reply is as follows": (Can. Com. Rep., 1900, p. 135.)

"Vandalia, Feb. 8, 1837.

Mr. J. M. Bucklin,

SIR:—"I am engaged as chairman of a committee of the Senate, investigating the questions which have recently arisen in regard to the change in the plans in constructing the Illinois and Michigan canal, and particularly the question in relation to the abandonment of the project of supplying the canal with water from the lake, and resorting to the Calamic. Not being an engineer, nor familiar with the calculations in relation to the quantity of water required to supply a canal of the size contemplated, I take the liberty of asking your assistance, and request the favor of you to review the calculations heretofore made by yourself and others in reference to the quantity of water in the Calamic, and to state the quantity required for the canal, as at present proposed to be constructed. You will also state if there is anything peculiar in the character of the coun-

try, to justify the erecting of a canal without providing the usual quantity of water for evaporation and leakage. All the documents, except the report made by you in 1830, will be furnished if desired.

Very respectfully, your obedient servant,

WM. THOMAS,

Chairman of the Committee on Canals, etc."

Can. Com. Rep. 1900, p. 135.

The following is Mr. Bucklin's reply:

"Sir:

It will give me great pleasure to afford you any information that I may possess in relation to the interesting subject which you have before you. I can, however, do little more than recapitulate the information that has been derived from various sources respecting it."

"The river Des Plaines was gauged at Laughton's ford, by Messrs. Post and Paul, in the first survey that was ever made of the route of the Illinois and Michigan canal, and the discharge found to be 72,000 cubic feet per hour. They also gauged it at the Canal Island, eighteen miles below, when they ascertained the discharge to be 117,000 cubic feet per hour. In October, 1829, it was gauged by Dr. Howard, U. S. civil engineer, who places the discharge at 96,480 cubic feet per hour. At the same place (Laughton's ford) it was again gauged by Messrs. Harrison & Guion, on the 8th of August, 1830, and found to discharge 60,000 cubic feet per hour. The Calamic river was gauged by me in the month of September, 1830, and found to discharge estimated at 320,000 cubic feet per hour. It was also gauged by M. Guion, assistant civil engineer, in the service of the United States, about the same time, and the discharge placed by him at 1,033,000 cubic feet per hour. It may be proper to remark here that the fall of 1830 was a season of extraordinary drought." (Can. Com. Rep., 1900, p. 135.)

6407a "The allowance of 100 cubic feet per mile per minute for evaporation and filteration was assumed by me as the basis of all calculations in deliberating the minimum quantity of water to be provided for the Illinois and Michigan canal."

"The surface of the canal as at present proposed to be constructed, is sixty feet, and bears the proportion of one and one-half to one to the surface of the canal as

at first proposed. The depth of water is now six feet whereas it was formerly four feet, consequently, the pressure of water being as the squares of the heights, and the leakage nearly as the square roots of the heights, the pressure will be more than doubled and the leakage (taking into calculation the great surface) increased in proportion to one and a half to one.

"The quantity of water then that will be required to supply the evaporation and leakage in a canal of the dimensions proposed, will be 150 cubic feet per minute per mile; and with reference to the peculiar character of the country through which the canal passes, I know of nothing which would justify a departure from the established rule, in regulating the supply of water. It is true the upper level is situated in a very wet country, but the levels below dependent upon the summit for water, are located on ground very badly calculated to retain it, and it is possible that more than the ordinary supply may be required."

"If the project of supplying the canal from Lake Michigan be abandoned, and the high level resorted to, the length of canal including feeders, to be supplied with water on the upper level is fifty-six miles, which will require 8,407 cubic feet per minute to supply the evaporation and leakage, and a further supply of 2,112 for lockage, making in all a minimum supply of 10,512 cubic feet per minute."

Very respectfully, your obedient servant,

J. M. BUCKLIN."

(Can. Com. Rep., 1900, p. 136.)

RIGHTS OF INDIANA IN THE CALUMET.

"Aside from the fact that, according to the most authentic information, the Calamic and Des Plaines do not afford sufficient water for the use of the canal, it is an admitted fact that the Calamic takes its rise in Indiana. From the latest maps it appears to bend through the corner of Illinois and pass into the lake near the State line. It is contended by some that it formerly passed into the lake in Indiana; it is, however, certain that the State of Indiana may use the water of the river to the exclusion of Illinois. The committee are not advised of

any improvement projected by the State of Indiana requiring the use of this river. But the testimony of Lieutenant Burnett herewith submitted, although not conclusive, tends strongly to prove that a company incorporated by the State of Indiana have projected a canal, which will require the use of at least half the water of that stream." (Can. Com. Rep., 1900, p. 136.)

"Upon the point now under consideration the committee have arrived at the following conclusions:"

"First—That the Calamic and Desplaines do not afford sufficient water for the use of the canal."

"Second—That if they did it would not be prudent or safe to rely upon the Calamic."

"In arriving at these conclusions the committee have relied upon the evidence referred to, consisting of extracts from reports, and other authentic documents. It must be evident to all those who have given the subject an examination that the point on the Calamic where it is proposd to take the water, is below the summit of the canal line, and only 2 feet 81-100 above the level of the lake. The erection of a dam across the Calamic would, therefore, be absolutely necessary, the effects and consequences of which cannot with any certainty be calculated or ascertained. One effect would doubtless be the overflowing of an immense tract of country and a subsequent loss of water by evaporation, absorption, etc." (Can. Com. Rep., 1900, p. 136.)

"Your committee will now proceed to the examination of the second and third reasons assigned why a change should be made in the Summit division of the canal, viz.: the length of time required and the difficulties and cost of construction. There are reasons which have
6408 often been urged and acted upon by those who have been opposed to the policy of the State's undertaking so stupendous a work; but the judgment of the people has long since been pronounced against their sufficiency. Your committee will not pretend but that there are many difficulties to be encountered in the prosecution of the work and that from five to eight years may be required for its completion. Having arrived at the same conclusion with all others who have examined the subject (*except the committee of the House*) that in order to construct such a canal as the nation has a right to expect, the waters of the lake must be used. The ques-

tion naturally recurs, shall the State persevere in the work, or shall the project be abandoned? These are the real question to be considered, in answering the reasons assigned for the proposed change: and as these questions are general and applicable to the whole line of the work, their consideration will be deferred UNTIL THE SECOND PROPOSITION FOR A CHANGE IS CONSIDERED AND DISPOSED OF."

SUBSTANCE OF REPLY. THE NATION HAS PAID WITH A LAND GRANT FOR A CANAL: THEREFORE, WE WILL NOT IMPROVE THE RIVER.

"The second reason urged, viz.: that the cost of the improvement will be greatly diminished will not be controverted, but the value of that improvement compared with the value of improvement, compared with the value of the canal and the comparative advantages of the two descriptions of improvements, have not been discussed in the report." (Can. Com. Rep., 1900, p. 137.)

"It is a work national in its character, and the people of Illinois should rejoice at the opportunity offered of being instrumental in executing a work of such vast magnitude and importance. The eyes of the civilized world are resting upon us with intense interest, for our success in a work which promises such extensive and incalculable advantages to these United States. The people of the United States are looking to the completion of this work, as forming the last link in an endless chain which shall forever hold these United States in the bonds and pledges of union, and your committee ask in the name of the civilized world, in the name of the people of the United States, and in the name of Illinois, that no local, sectional or private interests be consulted in the decision about to be made." (Can. Com. Rep., 1900, p. 137.)

"THE MAGNITUDE OF THE WORK, AND THE DIFFICULTIES ATTENDING ITS EXECUTION HAVE BEEN LONG KNOWN AND CONSIDERED."

"The representatives of the people did not engage in the work without a due consideration of those difficulties. The interest which the nation has taken in the project

is evinced by the act of Congress changing the northern boundary line of the State by the purchase from the Indians of a strip of territory extending from the Illinois to the lake, with an eye single to this project, by the act of Congress granting right of way to the State, and by the subsequent act granting lands of value sufficient to defray the whole cost of the work." (Can. Com. Rep., 1900, p. 137.)

"It has always been regarded as a national work, and the nation having furnished the means for its execution, have a right to expect the work shall be projected and executed *in a manner suited to the character and views of an united and enlightened people.* The fund for this purpose is admitted on all hands to be ample and no citizen of Illinois ought to be willing to see the faith of the State violated, public expectation disappointed, and the beneficence of the national government abused by authorizing any other description of work." (Can. Com. Rep., 1900, p. 137.)

"The question may be confidently asked—why should any one desire to disappoint the hopes and expectations of the nation in regard to the character of this work? Can it be supposed that the nation would have extended assistance by so large and extensive a grant of lands towards the execution of a project purely local, a project which at best would not accommodate the trade of Illinois alone five years hence." (Can. Com. Rep., 1900, p. 137.)

"To engage in such a project would be sporting with the bounty of the nation and degrading to the character of the State. Who among us would be willing to stand forth before an enlightened, liberal and magnanimous nation and proclaim the sentiment; the nation has furnished us with means to execute a great national work, and although by accepting those means we stand pledged to use them for the purpose intended, yet as a work of a totally different and greatly inferior character, can be executed for one-half the amount furnished, we will make such a work, and vest the other half of those means
6408a in bank stock or in improvements of a character purely local. If there be among us any who would be willing to assume such an attitude, and in the face of the world proclaim such a sentiment, it is to be hoped for the honor of the people and dignity of the State, none such can be

found in the walls of the Legislature. Such a sentiment strikes at the very foundation of the public faith, and if acted upon would lead to a total subversion and overthrow of our free institutions. The proposition is too monstrous and involves consequences too disastrous to be entertained for a moment, and your committee will not act upon the presumption, nor indulge the idea that any citizen of Illinois will ever be found giving countenance to such a sentiment. Your committee are satisfied that the canal lands will defray all expenditures required in the construction of the canal, upon the enlarged plan proposed by the canal commissioners, and they hope to see the time when its navigation will be made free to all the people of these United States." (Can. Com. Rep., 1900, p. 138.)

"There should be no question asked in regard to a supply of water from any other source than the lake, so long as it is known that the means furnished by the nation are amply sufficient to execute the work. In the completion of such a project, computations of time should be made with reference to the existence of the Union and not with reference to the growth of a village. If contrary to all calculations eight or fifteen years shall be required for its completion, this would not justify the State or the people in a violation of their plighted faith. The time is not distant when Illinois must stand at the head and in front of all of the western states, and when that time shall arrive, nothing could be a source of greater mortification to her citizens or her sisters than a knowledge that in her infancy she had been guilty of a violation of public faith." (Can. Com. Rep., 1900, p. 138.)

INTERROGATORIES FROM THE COMMITTEE ON ROADS AND CANALS TO THE COMMISSIONERS AND ENGINEERS OF THE ILL. & M. CANAL WITH THEIR ANSWERS.

"Question 1st:—What is the fall from Lake Juliet to the present termination of the canal, and what will be the cost of constructing the canal from said lake to its termination on the present plan?"

"Ans. The fall from the head of Lake Juliet to the present termination of the canal is about 75 feet. Cost

of constructing the canal from the head of the Lake to the termination—$2,213,557.42." (Can. Com. Rep., 1900, p. 138.)

6409 "Question 20.—What would be the cost of construction of slack water navigation from the foot of the rapids on the Illinois, to the head of the Lake Juliet, taking Mr. Hurd's estimate as a basis?"

"Ans. To estimate the cost of making slack water navigation of the Illinois River with any accuracy without a survey is impracticable; and to assume Mr. Hurd's estimate as a basis would show a fair comparison of costs between slack water and the Illinois and Michigan Canal, as now estimated; he having estimated lockage (it is believed at $1,500 per foot lift and the estimate of lockage on the western division of the canal being $3,000 per foot lift. Other items will also show a great difference."

"Q. 29. What quantity of water will the Calamic discharge per hour, allowing the river to be ninety yards wide, average depth eighteen inches, average current two miles per hour?"

"Ans. 10560 x 270 x 1.5—4,276,800 C. feet. (2 miles= 10,560 feet—90 yards=270 feet, 18 inches=1.5 feet.) Multiplying the three together, depth, breadth and velocity gives the cubic feet per time unit." (Can. Com. Rep., 1900, p. 139.)

"Q. 30. What quantity of water do you suppose passes out of the Saganash Swamp and Grassy Lake, also that portion that passes down the Valley of the Stoney Creek as well as that portion of water which empties into the Desplaines River?"

"Ans. In seasons of severe drought, not a drop." (Can. Com. Rep., 1900, p. 139.)

6410 "During the year 1836 the Canal Commissioners constructed by grading and bridging what was then known as the Saganaskee road, now known as Archer avenue and Archer road, extending from State street, Chicago, to Joliet." (Can. Com. Rep., 1900, p. 141.)

FROM ANNUAL REPORT DEC. 13, 1838.

PROGRESS IN CONSTRUCTION CUTTING OFF THE SWAMP ON THE SOUTHEAST.

6412 "The line is now under contract from the Chicago River to the termination of LaSalle, with the exception of about 22 miles of shallow cutting between Dresden and Marseilles and some other detached parts, amounting by estimate to $1,251,103.15, and a mile and a fraction of excavation in the Saganaskee Swamp, which from the peculiar character of the work, as described in the report of the chief engineer, must either be executed in part by agents of the State or wholly deferred until it can be drained through a series of sections below it. To avert the delay incident to the latter course, the first has been adopted, with orders for the immediate preparation of appropriate machinery. Efforts will be made to have everything ready for a commencement by the breaking up of winter. It was once thought that no subdivision of equal length would cost as much or present as many difficulties as the one which stretches through this famous swamp. The semi-final alluvion and vegetable matter of which the swamp is mostly constituted, are not more forbidding in their aspect than they are treacherous in their texture. Hence, for nearly two years it was impracticable at any season by any mode to penetrate it so thoroughly as to ascertain with certainty its true depth and character. The hard freeze of last winter and the low stage of the river and bordering morasses enabled the resident engineer, with a strong party, to traverse and sound every part of them." (Can. Com. Rep., 1900, p. 145.)

"It was found that the Desplaines could be safely turned into its ancient channel below a low island about a mile in length, redeeming by the process some three or four hundred acres of canal land, and securing to the State an important town site, which by any other arrangement, would have fallen on individual property. Convinced of the practicability of turning and dyking the river and that the flood waters of the Saganaskee Valley could be diverted into the Calamic, there was no further hesitation in cancelling the contracts on the

original circuitous route and locating a direct line costing upwards of a hundred and twenty thousand dollars less, and possessing other obvious advantages independent of the town site which at no remote period must be worth a large sum of money. For details, see reports of the principal and resident engineers." (Can. Com. Rep., 1900, p. 145.)

REFUSAL TO MEASURE THE DESPLAINES IN A GOOD YEAR.

6413 "Judge Wright arrived at Chicago in the early part of October, and on the 20th of the same month, Mr. Burnett made a detailed report, with a topographical map and estimates, of the quantities of excavation and other work necessary to effect the object on the most favorable route of the country was susceptible. *At that time and through the whole summer the Desplaines River was generally admitted to be unusually flush,* as was also the Calamic. No gauges were therefore ordered, and consequently those of the Desplaines made by the United States engineers in 1830, and of the Calamic by Mr. Bucklin, were adopted as the basis of the investigation." * * * (Can. Com. Rep., 1900, p. 147.)

"GAUGING IT IN THE DRY SEASON."

"The past dry season rendered the measuring of the Desplaines almost unnecessary, since for nearly four months the tightest dam that could be erected would not, at the point for taking out a feeder, have saved water enough to propel a single pair of ordinary mill-stones. Repeated gaugings from the 20th of July to the 22d of August and it was afterwards still lower, *gave an average* of less than the measurement of 1830." (Can. Com. Rep., 1900, p. 147.)

SWAMPS AND BLUFFS.

6413a "The fifteen sections extending from the Chicago River to the 'Point of Oaks,' eight miles and lying through the low wet prairie periodically flooded by the Desplaines River through Mud Lake, have been com-

pletely defended against any possible danger from surface water; and are now, by means of those defenses, accessible and tenable at any season of the year. The same plan of drainage and defense is gradually progressing from the 'Point of Oaks' to the Sanagaskee Swamp, and enough has been done to inspire the fullest confidence in the practicability and moderate cost of the work." (Can. Com. Rep., 1900, p. 148.)

"The costly and exposed sections around the base of the Kankakee bluffs are in the hands of experienced contractors, who are known to have executed extensive and more difficult jobs on the St. Lawrence Canal. The safety of the plan of construction is now generally conceded, and the price at which the work was taken was fair. From this point to Marseilles nothing has been let; thence to Ottawa the work is advancing steadily and will be finished in good time." (Can. Com. Rep., 1900, p. 148.)

COST OF CONSTRUCTION—VALUE OF LANDS EQUAL TO COST.

6415 "It appears from the estimates of the chief engineer as will be seen by an examination of his report that according to the contracts made, adding a full allowance for the light sections not under contract, the sum of $7,621,442.57 will cover, with very little variation, every expense for a convenient, substantial and elegant canal, such as it ought to be for commercial economy, durability and State character. The original estimate of the same engineer, exclusive of the additions at Ottawa and the enlargement of the basin in Chicago, was $8,654,337.51, being $1,032,894.94 more than will be required to complete the work." (Can. Com. Rep., 1900, p. 151.)

FROM CHIEF ENGINEER GOODING'S REPORT DEC. 10, 1838.
PROTECTION FROM OVERFLOW OF DESPLAINES.

"In conclusion, the Commissioners reiterate the opinion, expressed in the first annual report to the Governor, that 'if these lands and town lots be very gradually and cautiously brought into market, reserving the chief part until the canal shall have been completed, and all its ad-

vantages clearly understood, there is more than enough to build it on the present capacious and permanent plan. But, on the contrary, if sales be forced and all the lands be disposed of before their true value be known, there cannot fail to be a deficit of several millions of dollars. Many tracts of land that would not bring more than five or six dollars per acre if sold immediately may be worth a few years hence, from twenty to one hundred dollars. Innumerable instances of the kind might be adduced, some of them in the vicinity of the canal."

"All of which is respectfully submitted.

W. F. THORNTON,
Late President.
JACOB FRY,
Acting Commissioner.

(Can. Com. Rep., 1900, p. 152.)

6415a "The part of the line from the south branch of the Chicago River to summit or the Point of Oaks is now placed in such a situation as to insure its safety from the hight water caused by the overflowing of the Desplaines River."

"This has hitherto been the cause of much trouble and delay, and occasioned for a considerable length of time, an entire suspension of the work. A small part of the deep earth cutting in the valley of the Desplaines, between Summit and the Saganaskee, has also been protected, so that the work may be successfully prosecuted during the seasons of high water." (Can. Com. Rep., 1900, p. 152.)

USE OF RIVER CHANNEL.

"The location of the canal at the Saganaskee Swamp and the plan of constructing it have materially changed since my first estimate was made, and a very decided advantage gained in the expense, in the symmetry of the line, and in the increase value of State property. The canal as now located occupies as much of the channel of the river as can be made available upon a straight line. A new channel for the river will be opened on the west side of a low island or peninsula which extends the whole length of Sections 42, 43 and 44, and will occupy

nearly the same place where the main channel of the river appears once to have been. An embankment will be made connected with the spoil bank on the west side of the canal at the lower end of Section No. 41 (which is just above the Sag and near the present channel of the river) crossing the river from that point to the island, and running thence across the island to a bayou, which will form a part of the new channel; thence parallel with the canal and about twenty-two chains from it, upon the west side of said island to a point near the lower end of it; and thence across the canal upon Section No. 45, where it will be connected with the protection so as to exclude the waters of the river. Parallel with and near the embankment upon the west side of the island, the artificial channel will be made so as to unite the bayou above mentioned with one that extends up from the lower end of the island." (Can. Com. Rep., 1900, p. 152.)

"This channel will be opened 200 feet and all the earth excavation from it deposited upon the island side. It
6416 is believed that the depth of excavation sufficient only to remove the roots will be all that will be necessary; for the whole river being forced into the channel by the embankment above described, will cause a current sufficiently strong in time of floods to deepen and enlarge it to the requisite dimensions. There is a large, deep basin, or expansion of the river below the channel of sufficient capacity to hold all the deposit that can be washed into it." (Can. Com. Rep., 1900, p. 153.)

A Season of Severe Drought.

6416a "The value of the water power created here and at other points upon the canal, by drawing a supply of water directly from Lake Michigan, can be fully appreciated after a season of *such severe drought as the past.* The Desplaines River and many other considerable streams of the country have been nearly dried up, and probably three-fourths of the water-mills throughout a large portion of the United States have been standing still for the *last three months.*" (Can. Com. Rep., 1900, p. 154.)

LOCATION OF BASIN AND DAMS NOS. 1 AND 2.

6417 "Lock number 4 brings the canal to the level formed by the pool of dam number 1. A short distance below said lock, the line runs into the channel of the Desplaines River, which will here be turned to the right and the whole of the water forced into the channel upon the west side of Norman's Island." (Can. Com. Rep., 1900, p. 155.)

"The rock excavation in the bed of the river, from the point where the canal enters it to the upper end of said island, averages about two and a half feet in depth; but when the river is turned the excavation will be attended with no particular difficulty. The excavation continues across the island running out at the lower end of it, where the towing path crosses the river, and is thence continued down the right bank to the guard lock at dam number 2, where the independent canal again commences. From this point to the termination of the canal, the towing path is upon the left or south side." (Can. Com. Rep., 1900, p. 155.)

"From Norman's Island to dam number 1, which is located upon canal land, just above the town of Juliet, two strong walls with embankments between them, will be constructed upon the east side to confine the water in the pool of the dam. It is proposed to raise these walls and embankments 7 feet above the comb of the dam, to be perfectly secure from the highest floods. From dam number 1, to dam number 2, a similar defense will be required, but of a much less height." (Can. Com. Rep., 1900, p. 155.)

DUPAGE FEEDER.

"A feeder will be taken into the canal from the Du Page about three miles above the crossing. The last season has shown this stream to be one of the most permanent in the State, and it can be introduced as a feeder at a very moderate expense." (Can. Com. Rep., 1900, p. 155.)

SLOPE OF WALL AT DRESDEN.

"From the Du Page to Dresden the line has been but
6417a slightly changed since the first survey, but the quantity of slope wall to protect the canal at the Kankakee bluffs has been considerably increased to render the canal doubly secure at this exposed point." (Can. Com. Rep., 1900, p. 156.)

FROM CHIEF ENGINEER GOODING'S SUPPLEMENTAL REPORT OF DECEMBER, 1838.

6419a PROGRESS OF WORK.

"The number of laborers engaged upon the canal on the first of December last was not far from 350, and the force was not much augmented till the opening of spring navigation. There are now actually employed upon the canal, and in the various operations immediately connected with canal construction, about 1,700 men." (Can. Com. Rep., 1900, pp. 160-161.)

"HIGH WATER IN DESPLAINES—THE STATE SIDE DITCH.

6420 "The streams for a great part of the year have been *very high, particularly the Desplaines River;* but less interruption to the execution of the work has resulted from this cause than might have been anticipated from the unprotected state of most of the sections; and it has been clearly shown that a defense can be made at a moderate expense, that will render the whole work perfectly secure during the highest floods. The high water in the Illinois River has been the cause of serious delay in the excavation of the steamboat basin and channel at the termination, and a large force will be requisite upon the work as soon as a favorable season for operations shall be presented." (Can. Com. Rep., 1900, p. 161.)

"Considerable progress has been made in the deep earth excavation between the Chicago River and the Point of Oaks, but there has been so much water upon the surface since the work was let that the side ditch, which is to be formed on the south side of the canal without the spoil-bank, has not yet been finished, nor but

a small part on the bank on the north side, which is to guard against the water that flows from the Desplaines River in time of floods, and which is to be formed of earth excavated from a ditch within the prism of canal." (Can. Com. Rep., 1900, p. 161.)

6421 "During the past year ditches have been laid out, placed under contract and partly executed from the Point of Oaks to Chicago River, and from the mouth of Saganaskee swamp to Big run; the object of which is to receive and carry off the water which must otherwise drain into the canal, or accumulate behind the spoil-banks. By the aid of these ditches, the water (except what falls behind the spoil-banks) may be effectually prevented from conveying deposit into the canal, and also from interrupting the progress of the work during the construction." (Can. Com. Rep., 1900, p. 163.)

FROM RESIDENT ENGINEER TALCOTT'S REPORT OF DEC. 10, 1838.

"CANAL OVERFLOWED BY RIVER—DITCH TO CUT OFF THE DRAINAGE.

6422 "Upon resuming charge of the line in March, 1837, I found nearly every section, one to fifteen, inclusive, was the second time offered for contract in May, 1837. The unfavorable appearance of the work (nearly one-half of which was *overflowed by the river*) prevented much competition, and the proposals received were considered much above the real value of the work. Sections one, two and three only were awarded. The commissioners then determined to defend the work by a continuous embankment on the north side formed by excavation from the prism of the canal, and on the south by a *ditch* without the spoil-bank *to receive the drainage of the country* which is discharged into the southernmost branch of Chicago River." (Can. Com. Rep., 1900, p. 165.)

"The season was far advanced before much progress had been made, and the imperfect protection proved no defense against the unusual high water in December, 1837. Nearly every section that had been commenced was overflowed and the work generally suspended during the winter." (Can. Com. Rep., 1900, p. 166.)

USE OF RIVER BED.

6422a "That part of the line opposite to the Saganaskee valley was examined with reference to adopting the present channel and changing the river to what appears to have been its former channel on the west side of a peninsula island. These examinations were made at a high stage of water, which rendered it difficult to make them with the desirable precision. The data presented, however, were considered sufficient to determine the location by avoiding the river, yet approaching it somewhat nearer than the original line, and improving its general direction." (Can. Com. Rep., 1900, p. 166.)

DRAINAGE RESERVOIRS.

6423 "Between the Point of Oaks and the Saganaskee Valley, there will be required four receiving reservoirs for the drainage of the country. These will consist of a pit formed in the rear of the spoil bank, about thirty feet square excavated to two feet below top-water line of canal, with the sides and bottom paved, and communicating with the canal by a narrow passage. It is believed that these will receive the deposit usually carried into a canal by the drainage water—forming bars expensive to remove, and frequently proving a serious embarrassment in the navigation." (Can. Com. Rep., 1900, p. 167.)

"PROGRESS OF WORK—OVERFLOW BY RIVER.

6423a "When the amount of work performed during the two past years is contrasted with the expectations then formed by many of its friends, some may feel disappointed, yet, when it is considered that the season of 1837 was unusually wet; that nearly every section that had been commenced was *overflowed by the river* and the work necessarily suspended until the ensuing spring; the sickness that has prevailed through the past season; that the work is now generally secure against the surface water; and that cranes and railroads are now successfully employed for removing the rock on nearly every section—it must be admitted that much has been

done under the circumstances, and that the work presents a truly flattering prospect for its rapid progress in future." (Can. Com. Rep., 1900, p. 168.)

PIVOT BRIDGES.

6424 "Believing that it would be found advantageous to the commerce of the country for the lake vessels to navigate the canal *as far as Lockport* turning or pivot bridges have been estimated." (Can. Com. Rep., 1900, p. 168.)

FROM RESIDENT ENGINEER WM. JEROME'S REPORT, 1838. JOLIET BASIN—MOUTH OF RIVER—LOCATION OF CANAL RIVER WALLS.

"For three-fourths of a mile above and nearly through Juliet, the canal occupies the bed of the Desplaines River and is of increased width. The banks for this distance *are to be raised some feet above the ordinary height*, and to be protected from the wash of the floods by substantial walls on the inner sides."

"The river is to be raised to the requisite height by two stone dams at Juliet. With the upper dam is connected lock number 5, of ten feet lift, with a guard of four feet, making a valuable water power on canal land. With the lower dam is connected a guard lock; at which point the canal leaves the river."

"Owing to the height of the spring floods, it became apparent that the line from Juliet to and over the Du Page River would be benefited by being located on a higher level than the former, of some five or six feet. This location varies the line considerably from the original, although, taking the whole distance, the cost of construction is not materially changed; and it is believed that a better location has been obtained. By this means the Du Page River is passed by an equeduct sufficiently elevated above the highest floods to secure its permanency."

"About three miles above the aqueduct, the Du Page is to be received into the canal by a side cut of twenty chains in length, connected with a dam across said river.

"There is to be guard bank extending from the dam

up the east side of the river twenty-six chains. This bank is deemed necessary to prevent serious injury which would otherwise accrue to the canal at this point, from the high floods. Immediately below the aqueduct, are located locks number 6 and 7, with an aggregate lift of fifteen and a half feet. From thence to Dresden, a distance of five miles, the line occupies nearly the ground of the original location. The greater portion of this distance, the canal passes at the foot of the Kankakee bluffs; some part of the way *in the edge of the Des-*
6424a *plaines and Illinois Rivers*—the towing path bank to be protected from the great floods and extensive ice jams formed by the uniting of the waters of the Desplaines and Kankakee Rivers, *by a strong wall on the river side.*" (Can. Com. Rep., 1900, pp. 169-170.)

1837. Deep Cut or Shallow Cut.

From Consulting Engineer Wright's Report, Oct. 23,

6426a "From an examination of the various canal documents of the last session of the Legislature, it seems that the question stands as follows:

'Shall the feeding water be taken from Lake Michigan by a deep cut? or, shall the summit be raised ten feet above the lake, and fed from streams to be brought into it? It has been supposed, and no doubt correctly, that only three streams of water can be brought on the Summit level: First, the Desplaines River, second, the Calumet River; third, the Fox River.'

'The Desplaines was not in a proper situation to gauge, *as there had been copious rains;* I therefore take the former measurements of the United States engineers, as stated in the reports of the canal committee, at 54,800 cubic feet per hour.'

'By calculation it is found that, if twelve boats pass per hour, the lockage water to lock up and down ten feet will be 475,500 feet per hour. If we then add for leakage at the locks (a small item) and for evaporation, we ought not to say less than 500,000 cubic feet of water per hour will be required, when boats are passing as fast as they can be let through (or twelve per hour). It is true that, if boats passing each way were to meet so as to pass a boat up with the same water which passed one down, then only half the amount of lockage water

should be estimated for the twelve boats per hour, although, I believe twelve boats per hour may be passed each way, if the locks are well attended, and are in perfect order for filling and discharging the water rapidly.'

'These premises being admitted, we have to look for 445,200 cubic feet of water per hour more than the Desplaines gives us at low water.' (Can. Com. Rep., 1900, p. 174.)

"Taking a view of the whole ground, and looking at the probable cost of the deep cutting, of the low level,
6427 and the length of time it will take to accomplish it, and the time the country will lose the benefit; looking also at the great good to the country, and the pecuniary ad-
6427a vantage to the State and the canal, by the creation of water power at Lockport, and Juliet, I have no doubt upon my mind that the present plan of cutting down the Summit, so as to draw feeding water from Lake Michigan, ought to be continued, in preference to any other which I can suggest." (Can. Com. Rep., 1900, pp. 175-176.)

USE OF DESPLAINES AS SUMMIT FEEDER SIDE DITCH TO CUT OFF DRAINAGE.

6429a "I would not fill the summit level with the water from the Chicago but let it fill slowly from other streams before I broke this bar of earth; this can be removed by a dredger."

"4th. Is the present plant of drainage a judicious one, and what difficulty may be anticipated from water in excavating the Summit?"

"The greatest difficulty in working this division is the water, beginning at Chicago River, and from thence to the end of Section 15. If I have understood the plan of the chief engineer, it is his intention to have a large ditch outside of the spoil-bank, on the upper or southeast side, and this to be extended as now partly done, to the south branch of the Chicago."

"It may perhaps be found that some of the sections near the Point of Oaks do not drain freely by this ditch; if so, then they must be drained across the canal. A guard bank of earth must be raised along the north side to keep out the water from the Desplaines River and from the prairie. These precautions will keep out sur-

face water, which is nearly all they have to contend with on this part. From the Point of Oaks, on Section 15 to 45, is the most difficult part to drain." (Can. Com. Rep., 1900, p. 180.)

6430 "But in order to drain this part, from 15 to 45 effectually, a very large drain nearly or quite the size of a forty-foot canal, should be cut from Section 42 or 43, and extend eastward through the whole Saganaskee swamp to Stony Creek. This must be cut three feet at the canal and 8½ feet at the summit of the swamp, 5 miles east of the canal, and then continue 7 or 8 miles further before it will find a free discharge; the water having so far to run must have a large bed, as there will be a great collection of water in heavy rain." (Can. Com. Rep., 1900, p. 181.)

6433 DAMAGE FROM A SUSPENSION OF THE CANAL DEC., 1839.

(Consequent upon the Financial Depression of 1837-8.)
Considered pp. 185-189.

COST OF THE WORK AND VALUE OF LANDS.

From Commissioners' Report of Dec. 21, 1840. (Can. Com. Rep., 1900, p. 187.)

6433a "The lands, towns, water power, coal mines and stone quarries must bring their improved worth or they will not be sufficient to pay the current interest and discharge any considerable portion of the debts. On this subject the board remain firm in the opinion expressed in their first annual report and repeated in several others, that, 'if these lands and town lots be gradually and cautiously brought into market, reserving the chief part until the canal shall have been completed and all its advantages clearly understood, there is enough to build it on its present capacious and permanent plan. But on the contrary, if sales be forced before their true value be known, there cannot fail to be a deficit of several millions.'" (Can. Com. Rep., 1900, p. 188.)

6434a (Can. Com. Rep., 1900, p. 190.)

LEGISLATIVE COMMITTEE'S REPORT. (1840-1.) SUMMARY OF HISTORY—RECOMMENDS COMPLETION.

"By an Act of Congress of March 30, 1832, the state was authorized to construct the canal over the public lands and ninety feet of land was given on each side of the canal to the state. The canal was to be begun in three and completed in twelve years. The act gave the state the right to use any materials upon Government lands, necessary to complete the work. Another act was passed March 2, 1827, which granted to the state a quantity of land equal to one-half of five sections, on each side of the canal, and reserving each alternate section to the United States. Another act of Congress was passed March 2, 1833, granting to the state the right to construct a railroad in the place of a canal, and extending the time to complete either to five years. In consequence of this grant the legislature of Illinois appointed, at the session of 1822 and '23, a board of Canal Commissioners who made an examination and an estimate of the probable cost of the work. This estimate cost, which was only made from a surface survey, without ascertaining the amount of rock excavation, fell a little short of $800,000. The survey cost the state over $10,000. At the same session, a company, with a capital not exceeding one million, was chartered, to complete the canal, which was to be constructed and owned by the company for fifty years—after which the state had a right to purchase it, by paying the cost of construction and six per cent. per annum; but in 1826, this act was repealed.

In 1829, a new board was organized, with power to make further surveys and begin the work. And by a further act of 1831, the commissioners were authorized to lay out towns, and did proceed to lay off and sell lots in Chicago and Ottawa, and sell lands along the route. They also reported separate statements of the cost of constructing a canal and a railroad between Lake Michigan and the Illinois river. By estimates of the first work they reported it cost at $4,043,086.50 and that of a railroad $1,052,488.19. At the next session the legislature abolished the office of canal commissioner, after these efforts had cost the state $16,972.83. Again at the ses-

sion of 1834 and '35, Mr. Forquer, the chairman of the Committee on Internal Improvements, considering the importance of this subject (which had been referred to in the Governor's message), and with the feeling of a patriot and the views of an enlightened statesman, again brought this question, by his report, to the consideration of the Senate, and to every citizen who felt the great importance of this enterprise to the present and future prosperity of our state.

The people of Illinois had, in this manner, and by the sale of the canal lands and the beginning of the work, so far accepted the grant of the General Government, and had duly considered and determined whether they would yield this grant of land to any company, or undertake the canal on the faith and credit of the state.

The lucid report of Mr. Forquer, of 1835, induced another enactment of the legislature which seemed conclusively to fix the settled policy which the state had determined to pursue, on the acceptance of this grant from the United States, and the manner in which the work was to be commenced and completed—that is, on the sole responsibility of the state. But owing to the imperfection of the act of 1835, the Governor was not entitled to borrow the money necessary to begin the work.

Again in 1836 the people, impressed with the magnitude and value of this work to the growth of our infant but fast settling state, asked the legislature to pass another law, empowering the Governor to negotiate a loan on the sole faith of the state. This last act created an-
6435 other board of canal commissioners, who commenced new surveys and estimates preparatory to renewed exertion to its completion. Contracts were let, and labor performed to the amount of $35,744.83. In this year the commissioners laid off town lots, at Chicago and sold them to the amount of over $1,000,000 with a common understanding that the canal was to be completed. The action of the legislature thus far, and in 1836 especially, had furnished to citizens of sister states and to foreigners, sure reasons for emigration here, and the inducing and powerful motives for the investment of their capital. • • •

Again in 1837, the legislature, coming afresh from

their constituents, after the work was begun, and impressed with its importance, passed an amendatory act of 1836, to aid in its completion. This year there was expended on the canal $356,899.43. The commissioners also sold additional town lots and lands, to assist in paying off the canal debt. These lots and lands, also were sold, as the others had been, with the common understanding that this enterprise was not to languish or fail, by our neglect to put in requisition the available means, so ample, and which had been looked to ultimately, for the final completion of this work. The close relation then, which exists between this long contemplated improvement and the lasting interests of our citizens, and so universally acknowledged and by few questioned, induces the committee, with the more confidence, to ask its final completion."

CANAL VS. RAILROADS.

"The committee will not dwell longer on this branch of the subject but will hasten to answer a question which has been recently made by some gentlemen of standing, in and out of the legislature, 'whether it would not be the part of wisdom now to abandon this canal and construct a railroad along the route?' The committee are not insensible to the benefits arising to the country from the completion of well planned railroads. But they have no difficulty in coming to a conclusion to prefer canals over railroads." (Can. Com. Rep., 1900, p. 191.)

GOV. FORD'S MESSAGE DEC. 8, 1842.

RECOMMENDS COMPLETION.

RECOMMENDS CHANGE TO HIGH LEVEL—SHALLOW CUT.

6437a "The canal lands and lots and other property belonging to it, stand upon a different footing. This property was first given to the state in trust to make the canal. It was afterwards appropriated by the General Assembly to that specific object, and solemnly pledged to creditors for the payment of money heretofore borrowed, and which money has been used in the construction of

the canal so far as it has proceeded. Those creditors, therefore, have such a separate and exclusive right to its avails as would not without their consent justify throwing it into an aggregate fund for a general payment of debt. If they should require it we would be bound in duty and honor to surrender it to them. It is, however, believed that no such requisition will be made. They understand their true interest too well; they know as well as ourselves the importance and profitable character of this great work, and would prefer looking to its probable completion rather than an immediate sacrifice of the means of carrying it on, for ultimate payment. They must, and do understand, that if this property should be sacrificed, the state will have no means or payment for a long time to come; whereas, if the canal progresses, to completion, the lands and lots and water power will be quadrupled in value, and the tolls alone would in a short time pay interest on all the debt contracted for its construction." (Can. Com. Rep., 1900, p. 196.)

6438 "The sum of four million eight hundred thousand dollars, or thereabouts, has already been expended on this work in its construction, and in the payment of interest; seven hundred and fifty thousand, five hundred and thirty dollars and forty-two cents, of which has been raised by a sale of lands, lots, timber and stone; 10,580 acres of land were sold in 1830 for $14,204.87; also at the same time 126 lots in Chicago and 9 lots in Ottawa were sold for $4,594. Since 1836, 40,295 acres have been sold for $302,248.40; and about 189 lots in La Salle, Ottawa and Lockport for $77,793; stone and timber to the amount of $9,659.00 and sales were made in Chicago and Ottawa in 1836 for which cash has been received to the amount of $544,074.97; and there is now due the canal fund on account of sales, the sum of $207,682.53.

In addition to this balance, the property belonging to the canal fund is as follows: Two hundred and thirty thousand, four hundred and sixty-seven acres of land, 370 lots in Chicago, 679 in Lockport, 914 in Ottawa, 1,528 in La Salle, other town property to be laid out at Juliet, Du Page and other places; and the water power on the entire line of the canal; the whole, valued by the

Acting Canal Commissioner, from whom these statistics were derived, at the sum of $5,050,000.00. It is, however, due to the subject to state, that this valuation is predicated upon the hypothesis that the canal is to be completed, or insure prospects thereof.

I therefore, respectfully recommend to the General Assembly, that the further measures to be adopted for the prosecution of the work should be upon the *plan of a moderate sized high level canal.* I am fully sensible of the great responsibility assumed by me, in making this recommendation, nothing but a full conviction of our inability to proceed with the enlarged work would justify a *change of plan after it has progressed so far as it has.* But, in view of our present and prospective want of credit and resources, it does seem that the enlarged work is not to be achieved by any means now in our power; and, indeed, it does seem that we are to choose between reduction and no canal of any description." (Can. Com. Rep., 1900, p. 197.)

LEGISLATIVE REPORT—1842; THE MORTGAGE TO CANAL TRUSTEES PROPOSED.

6438a "After careful investigation and close examination of the various plans and suggestions for carrying on the canal the committee have come to the conclusion that there is but one plan which, at the present time, appears practical and worthy of consideration; they have come to this conclusion from an examination of different letters and plans from the most distinguished citizens and capitalists in the City of New York and also from London. The views given in the letters and plans referred to are judicious, sound and practical, and if carried into effect would undoubtedly secure the completion of the canal and the ultimate payment of the whole debt of the state. * * *

If we attempted to rear a structure of too gigantic proportions, one which fell of its own cumbrous weight, it does not become us to spend our time in vain regrets and grieve in idleness over our disappointments, but let us gather what yet remains uninjured from the ruins and erect a fabric more proportionate to our means.

The proposition for carrying on the canal made by many of the creditors of the state, is as follows:

First, the state to convey all the canal lands, town lots, water power, coal beds, stone quarries, and all the canal property, together with all the tolls that may be derived from transportation upon the canal to trustees, who shall hold the aforesaid property in trust for the canal bondholders. The aforesaid trustees to be appointed as follows: Two on the part of the creditors and one on the part of the state. The canal bondholders are to subscribe a sum sufficient to complete the canal to be disbursed by the trustees in the construction of the canal. The trustees to have all the power given to the Canal Commissioners. After the canal shall be completed the trustees are to proceed to sell the canal property from time to time as the demand may require. All receipts of moneys are to be paid, first, to reimburse the subscribers for the new advance, and second to pay the bonds they now hold against the state. Those bondholders subscribing to have a preference over all others, and those refusing to subscribe to be paid last. After the creditors, who may advance the required means, are paid the amount of subscription and the bonds they now hold, the duties of the Board of Trustees shall cease, and the state again to have the entire control of the canal and its property." * * * (Can. Com. Rep., 1900, p. 198.)

FROM SENATE REPORT DEC. 14, 1842. PROPOSES ASKING NATIONAL AID.

6439a "That in consequence of the present embarrassed condition of the canal the total suspension of the work and the utter inability of the state to afford any aid, they deem it right and proper to ask Congress further aid in *carrying on and completing this great and noble improvement.* Your committee would respectfully suggest the propriety of so framing the memorial as to place the requisition upon the ground of this canal being a national work, and that it was in consequence of the donation from the General Government that the state was induced to commence this gigantic undertaking, under the belief that the apropriation of land was

sufficient to complete it. That the donation was based upon the estimates of the United States engineers, and that time and further developments have shown that their estimates covered but a small part of the real cost of this canal. That they believe it was the intention of Congress to have the donation cover the cost of the work, and that now, the state having become involved and unable to progress with it, Congress are in honor bound to render further aid." (Can. Com. Rep., 1900, p. 200.)

FROM ENGINEER GOODING'S REPORT DEC. 1842.

"The cost of the canal may now be represented as
6440 follows, to-wit:

The amount of work which has been completed and that which is now under contract	$6,751,006.21
The amount of work not under contract	906,665.11
For superintendence and contingencies	350,000.00
Total cost of the canal	$8,007,661.32

(Can. Com. Rep., 1900, p. 201.)

6440a (Can. Com. Rep., 1900, p. 202.)

The total amount of work done is	$4,699,492.03
Cost of superintendence and contingencies properly chargeable to construction, account to this time about	210,000.00
Total expense incurred	$4,909,492.03
Total amount remaining to be done	3,098,169.29

Of the amount to be done $2,958,169.29 is for unfinished work, and the balance ($140,000) for superintendence and contingencies.

From the time the Illinois and Michigan Canal was first projected there seems to have been a difference of opinion amongst its friends in relation to the proper size of the work and plan of its construction. As this difference of opinion still prevails, in order, in some measure to account for it, it may not be improper to allude to the different surveys which have been made, and the different opinions entertained and expressed by those who made or directed them, in relation to this great work.

The first survey was made in the autumn of 1824, by Colonels Post and Paul, under the direction of Messrs. Sloo, Brown, West and Smith, Canal Commissioners. An examination of the reports of these gentlemen will show that notwithstanding their ability, their survey and estimates did not give a correct idea of the obstacles to be overcome in the construction of the canal. In fact, the little that was known of the country previous to the commencement of the examinations, and the very imperfect knowledge which the best informed in this country at that time had in relation to public works of this character, rendered it almost impossible that they should have formed very correct opinions of the magnitude of the undertaking. But low as were their estimates, it is obvious they were higher than the public expected; for the Commissioners, after giving the estimates of the engineers, remark, that 'these estimates, it is true, exceed considerably the general expectation, and the Commissioners are too well aware of the financial embarrassments of the state, at present, to indulge a well founded hope that immediate measures can be adopted for executing a work of so much importance.

The estimates of the five different routes marked out, were as follows, to-wit:

First route is estimated at.....	$716,110.71
Second route is estimated at.....	639,542.78
Third route is estimated at.....	668,289.68
Fourth route is estimated at.....	682,610.20
Fifth route is estimated at.....	689,746.96

On the fourth route the supply of water was to be drawn in part from Lake Michigan and on the fifth, entirely from this source; though upon both plans or routes the deep cut of our present plan must have been encountered.

The canal, as estimated above, would have been two feet in depth, and twenty in width, less than our present canal.

The gauges of the different streams from which a supply of water would have been drawn, are given as follows, to-wit:

Desplaines river	at	Cache	Island..	117,000	feet	per hour.
DuPage	"	"	"	..114,000	"	"
Aux Sable	"	"	"	.. 60,000	"	"
Fox	"	"	"	..450,000	"	"

The engineers remark in relation to these gauges that the 'results are predicated upon the present stage of water,' and that the quantities may sometimes be lower.

From the foregoing extracts it is plain that no difficulty was anticipated in relation to a cheap supply of water for the canal. If the streams on the route would not afford sufficient water, it would cost no more to procure a never-failing supply from Lake Michigan than from these sources.

The surveys of the canal route by the United States engineers in 1830 and in 1831, seem to have been made more to ascertain the practicability of the work and the general character of the route, than with a view to obtain data for a particular estimate of cost. In fact, I
6441 believe that no estimate of the cost of the work was submitted until the summer of 1834, at least I have never seen one of an earlier date. Gen. Gratiot submitted his estimate in June, 1834, of the cost of constructing a steamboat canal from Chicago to the mouth of the Little Vermilion river. The dimensions were as follows, to-wit:

For the first twenty-seven miles from the lake, *or to the running out of the lake level, the canal, except two miles, is one hundred feet wide and ten feet deep.* The remaining two miles to be distributed in short sections at convenient distances, 'to be *two hundred feet wide;* to accommodate boats while detained in changing cargoes without interruption to the navigation.' The remaining distance of sixty-five miles 'to be not less than *one hundred feet at the surface and six feet deep.* The total cost of this canal was estimated at $4,299,439.81.

The contest in the winter of 1836-7 closed by the passage of a law authorizing the Canal Commissioners to prosecute the work upon the present plan, but requiring them to procure a skillful engineer from abroad to examine and report whether 'a supply of water from sources within the legitimate authority of the State of Illinois,' could be procured without resorting to the lake, or *in other words, whether a shallow cut, or high level canal could be supplied with water,* and if so, whether enough could be gained to make it for the interest of the state to change the plan which had already been adopted by law, after a considerable portion of the work had been placed under contract.

Judge Wright was the eminent engineer whose services were secured by the Commissioners, and the substance of his report upon this subject is well known to the public. From the time his report was published until the work was nearly suspended on account of the financial embarrassments of the state, little was said about a change of plan. It was supposed that there was nearly or quite canal property enough to complete it upon the deep cut plan, and so long as the state could procure the money to carry on the work, little solicitude was felt as to the plan, though it was still believed by many that it should have been changed, or that the high level should have been adopted at the outset.

It never having been made a part of my duty to investigate this subject I have hitherto deemed it improper to allude to it in my reports, but at this important crisis in the affairs of the canal, when the work is nearly suspended, the state credit gone, our citizens discouraged, and no hopes entertained of brighter prospects until the completion of this important improvement is rendered certain, I shall present a few facts and conclusions which I believe may be of some public utility, and which certainly can do no injury to the best interests of the canal.

The length of the canal from Chicago river, or the waters of Lake Michigan to Marseilles is seventy-four miles. The demand for water upon this line, assuming the usual data (as far as adapted to the present work), adopted by experienced engineers in other states, and obtained by actual experiments on several different canals, may be calculated as follows, to-wit:

From Section No. 1 to Section 64 inclusive, for evaporation and leakage at lock gates, there being no loss by filtration.....	400	cubic per min.
From Sec. 64 to Marseilles, 47 miles, at 150 cubic feet mile.....7,050	"	" "
Lockage water for locks at each end of the line, on plan of the high level 2,174	"	" "
Total demand 9,924	cubic per min.	

(Can. Com. Rep., 1900, p. 203.)

6441a I have calculated no loss by filtration from Chicago river to Section 64, because I have supposed that the canal upon the high level will be sunk so low that the surface of the water, in all cases, will be below the natural surface of the ground and on a level, for most of the distance, as low as the surface of the Desplaines river. The soil, too, and the rock through which the excavations are made, are of such a character that no danger need be apprehended that any water will leak out or be absorbed on this portion of the work. The evaporation is in reality, almost too small an item to be taken into the account at all, but it is mentioned because it is usually estimated in computing the demand for water upon canals.

But the evaporation upon the whole of our canal, calculating the length at ninety-six miles, *and the width at sixty feet* would be but 264 cubic feet per minute, estimating the evaporation during a season of navigation of 240 days to be three feet (which is about the average annual evaporation in this country), or it would be less than three cubic feet per minute per mile.

The leakage at the lock gates will be but a small item, if the work be properly executed and the allowance made is undoubtedly sufficient.

In calculating the amount of lockage water necessary, I have estimated water sufficient to fill the locks (one of eight and one of ten feet lift) *one hundred times in every twenty-four hours.* But it is not probable that this amount of water will be necessary for the *passage of* 100 *boats.* As nearly an equal number of boats must pass each way during the season of navigation, it is obvious that the chances are nearly equal that a single lock full of water would pass one boat up and another down. Or, in other words, it is as likely that the two boats will meet passing in oppostie directions, as that one will closely follow another going in the same direction. It is, therefore, possible that the quantity of water estimated for 100 lockages across the summit, would be sufficient to pass 150 boats.

Gauge of Calumet river by U. S. Engineers—17,281 per min. by Bucklin, 5,323 per min.

S. Desplaines river Post & Paul, 1950 by Bucklin 1,000 per min.

S. DuPage river U. S. Engineers, 1665 by Bucklin 6916 per min.

The aggregate minimum discharge of the three rivers would then be shown thus:

Calumet, 5,333; *Desplaines,* 1,000; DuPage, 1,665= 7,998 cubic feet per minute.

This quantity of water was to supply the filtration and evaporation of seventy-four miles of canal, the necessary lockage water, and the loss at the dams and upon the Calumet feeder. It is, therefore, obvious that there would have been barely a supply for a canal of ordinary dimensions, admitting that the water could be introduced (as it might have been) at the points desired.

The Calumet was gauged on the 17th of May and was found to discharge 8,296 cubic feet per minute, and again on the 24th of September, when the quantity was 6,137 cubic feet per minute, and still again on the 17th of October, when the discharge was reduced to 5,634 cubic feet per minute.

A very satisfactory measurement of the DuPage was obtained on the 21st of September and the discharge of water was then found to be 2,928 cubic feet per minute. (Can. Com. Rep., 1900, p. 204.)

6442 The construction of the perfectly water tight dam at Joliet has enabled us to ascertain with precision the quantity of water flowing in the Desplaines. This river has been nearly dried up; the measurement on the 20th of September showing 338 *cubic feet* and on the 21st of the same month 373 cubic feet per minute.

The quantity of water in all these streams continue to diminish till the first of November, when the probable quantities would have been about as follows, to-wit:

In the Calumet river.....	5,300	cubic	feet	per	min.
In the Desplaines river.....	200	"	"	"	"
In the DuPage river.....	1,888	"	"	"	"
Total	7,300	"	"	"	"

The necessary quantity of water to supply the canal from Chicago to Marseilles, is 9,924 cubic feet per minute. This would show a deficiency of 2,624 cubic feet per minute, admitting that all the water could be turned into the canal. There will be some loss at the dam at

the Calumet and upon three or four miles of the feeder, and also at the DuPage dam. It would, however, be safe to calculate that there could be introduced into the canal from these rivers the following quantities, to-wit:

From the Calumet river.....4,500 cubic feet per min.
From the Desplaines..... 200 " " " "
From the DuPage.....1,600 " " " "

Total supply .....6,300 " " " "
Total supply .....9,924 " " " "

Total deficiency .....3,624 " " " "

There would not, it is true, be so large a deficiency except in *extraordinary dry seasons, and in most seasons probably none at all."*

Were the deep cut plan to be carried out at an average stage of Lake Michigan there would be an abundant supply of water drawn from the lake, not only for navigation, but for water power. There would be no locks to obstruct the passage of boats or lake vessels of good size between Chicago and Lockport. The water power at Lockport and Joliet would be greater and more permanent (at the usual stage of the lake), than it would be upon the shallow cut plan. The navigation of the canal would not be liable to interrupt from breaches in dams or embankments, and the plan is much more magnificent. Besides, if the waters of Lake Michigan do not get through this channel to the Mississippi, there is no other through which they can be conducted, and a great deal will have been said for nothing about mingling the waters of the lakes and with those of the Gulf of Mexico.

In constructing the Illinois and Michigan Canal of the dimensions *now adopted,* reference has generally been had to a future enlargement. Through all the towns and proposed town sites, as Lockport, Juliet, DuPage, Ottawa, etc., the canal is nearly double, and in some instances more than double, the ordinary width. In the deep cutting, the spoil-banks were removed a sufficient distance to leave room for the widening of the canal, and in a few instances, if any, would there be any additional damages to be paid for property. However remote the period may be when an enlargement of this

work will take place, it is certainly the part of wisdom to provide for it now. That it will be enlarged, sooner or later, there can be no doubt, and also that *the Illinois river will be so improved (an indispensable improvement) as to meet the enlarged capacity of the canal.* (Can. Com. Rep., 1900, p. 205.)

6443a Feb. 21—1843—Enactment of "An Act to provide for the completion of the I. & M. Canal and for the payment of the canal debt."

March 1—1845—Supplemental Act providing for execution by Governor of "a deed of trust to the said trustees of all the property and effects mentioned in the tenth section of said act; which said conveyance shall include the lands and lots remaining unsold, donated by the United States to the State of Illinois to aid in the completion of the said canal; to be held in trust as in said act stipulated."

"The provision of the above act having been fully complied with, a meeting was held at the American Exchange Bank of New York on the 27th day of May, 1845, and William H. Swift and David Leavitt were elected trustees by the subscribers to the loans; William H. Swift being by ballot designated as president of the board. (William H. Swift was continued as president of this board until the termination of the trust in 1871.) On the 10th day of June following, his Excellency, Governor Ford, appointed Jacob Fry trustee on behalf of the State of Illinois." (Can. Com. Rep., 1900, p. 208.)

FROM REPORT OF BOARD OF TRUSTEES, NOV. 30, 1848.

(Can. Com. Rep., 1900, p. 209.)

6444 "On the 24th of April, the board while in session at Chicago, received a report from the chief engineer, stating that the canal was so far completed as to be in navigable order, that the first boat (the General Fry) had passed over the Summit level from Lockport to Chicago on the 10th of April, and that the first boat which had passed through the entire length of the canal from La Salle to Chicago (the General Thornton owned by Isaac Hardy) had arrived at Chicago on the 23rd of April."

"As a matter of some interest connected with the arrival of this boat, it may be stated that sugar, etc.,

from New Orleans, brought by the General Thornton to Chicago was received at Buffalo (via Mackinaw) on the 30th of April, some two weeks before the first boat had reached Buffalo by the Erie Canal.

The chief engineer states that all the work upon the main line of the canal is fully completed according to the original intention of the board, except three inconsiderable items, to-wit: First, some timbers for coping the towpath wall on the Summit; second, the painting of several bridges and aqueducts; third, the excavation of some 2,500 cubic yards of earth, and the building of 300 cubic yards of work on Sections 195 and 197. The whole cost of these is stated at $3,900. The two first will be finished in the course of the winter, but the last cannot be conomically done until the water in the Illinois river is low.

"All the feeders are completed with the exception of the Calumet, which is the main feeder for the Summit level. Very unusual difficulties have been encountered in the excavation of this line, being for a great portion of the distance through a swamp, the material has been dredged out by means of steam excavations, as it was too soft to remove it by digging in the ordinary method, and hence the delay in its completion. It will be done in February and with the opening of navigation in the spring the waters of the Calumet river will be dis-
6444a charged upon the Summit level. The following table exhibits the cost of completing the canal and the feeders according to the report of the chief engineer:

Canal proper, including pumping engines, etc.		$1,159,652.44
Calumet feeder, work done	$68,397,22	
Calumet feeder to be done, estimate	23,102.78	
		91,500.00
Kankakee feeder		84,573.29
Superintendence and contingencies		66,527.06
Total cost of completion		$1,401,192.79

From Woodruff's history of Will County: 'The Project of a ship canal to connect the waters of Lake Michigan with the navigable waters of the Illinois river was first suggested during the war of 1812, by

some writer in the Niles Register in 1816. The title to a strip 20 miles wide was obtained of the Indians with a view to such work.'

From the Northwest and Chicago, by Rufus Blanchard:

Previous to 1816 the united tribes of Indians known as Ottawas, Chippewas and Pottawattomies, claimed all the land between Chicago and the mouth of the Fox river. In order to secure undisputed possession of the river between these two points, a treaty was arranged between these tribes and Ninian Edwards, William Clark and August Chonteau, Commissioners Plenipotentiary of the United States; this treaty was consummated the 24th day of Augst, 1816, and was signed by the above named Commissioners and F. Assikinock, otherwise known as Black Partridge, chief of the united tribes. The object in securing this strip was to construct a military road to facilitate the building of the proposed ship canal.

From the history of Chicago, by Bross, Book B, 1370, Chicago Public Library:

At the first session of the legislature in 1818, Governor Bond brought up the subject of a canal from Lake Michigan to the Illinois river. By an act passed July 14, 1823, a Board of Canal Commissioners was appointed, and in the autumn of that year a portion of the board, with Col. J. Post of Missouri, as chief engineer, made a tour of reconnoissance, and in the autumn of 1824, Col. R. Paul, an able engineer residing in St. Louis, was also employed. Five different routes were surveyed and estimates made of the cost of the canal. The highest estimate was $716,110.00. In the autumn of 1829 the Commissioners came to Chicago, have employed James Thompson to survey and lay off the town. His first map bears date of August 4, 1830.

The beginning of the canal was celebrated July 4, 1836, by nearly the whole City of Chicago going up to Bridgeport on the small steamer George W. Dole, towing two schooners. Dr. Wm. B. Egan delivered the address and the Hon. Theophilus W. Smith began the ditch by throwing out the first shovelful of earth.''

LOCKPORT, ILL., March 22, 1871.

Messrs. Hoyne, Horton & Hoyne,
Chicago, Ill.

GENTS:—

Yours of the 20th inst. asking for 'certified copy of survey or location of the canal in 1836 and also in 1846 in Section 29 and 30, T. 39 North, Range 14 E.' I send you herewith a diagram showing the location as you desire, certified by A. J. Matthewson, the engineer who made the survey. The change in the location from the survey of 1836 to that upon which the canal was finally constructed was made in 1845 (not in 1846) when operations were commenced under the trust and was authorized by Section 13 of 'the act to provide for the completion of the Illinois and Michigan Canal, and the payment of the canal debt,' approved February 21, 1843.

Truly yours,

WILLIAM GOODING."

(Can. Com. Rep., 1900, p. 210.)

6448a

KANKAKEE FEEDER.

(Can. Com. Rep., 1900, p. 218.)

"A navigable feeder from the Kankakee river was surveyed in 1845 and ordered constructed in 1846. The width to be 40 feet at top water line, 26 feet at bottom, 4 feet deep except at lower end where the depth was to be 5 feet. The slope to be 2 to 1 raised 3 feet above top water line—delivery 2 inches to the mile. This feeder was completed in 1848. The termination of the feeder was at a point on the canal 1,820 feet S. E. of the N. W. corner of Section 31, Tp. 34 N., R. 9 passes in a southwest course across the Du Page river where it enters Section 36, Tp. 34 N., R. 8; thence S. W. 1,056 feet to the center section line 538 feet west of the east line of the section; thence south to a point 792 feet north of the south line of Section 36; thence southeast entering Section 3-34-9 again at a point 264 feet north of its southwest corner; crossing this corner it then passes through Section 6, 4 and 5 to a point near
6449 the center of the southeast quarter of Section 9; all in Tp. 33 N., R. 9, whence a dam was constructed across

the Kankakee river and from which it received its supply of water.

The 90 foot reserve was surveyed in 1848 by Artemus J. Mathewson, a plat was made of the feeder and reserve and appears in the plat book number 2, Canal Records.

The total cost approximately very nearly to $50,000." (Can. Com. Rep., 1900, p. 219.)

FROM A LETTER BY A. J. GALLOWAY, DATED APRIL 20, 1846.

"Canal Office, Lockport,
April 20, 1846.

"*To the Board of Trustees of the Illinois and Michigan Canal.*

"GENTLEMEN:—The Secretary of our board has submitted to me the following order to which I have the honor to reply:

> 'Ordered, That the Chief Engineer be requested to report to the board the results of the surveys of the several feeders which have been made since the adjournment of the board on the 24th July last, together with the estimated cost of constructing each feeder; also that he communicate his opinion in reference to the most advantageous disposition to be made of the several feeders, and the best mode of supplying the different levels with a sufficiency of water for the purpose of navigation.'

The surveys of the feeders were commenced on the 14th of July last, and finished on the 6th day of November under the immediate direction of the principal assistant, who was aided by Messrs. Benjamin, Mathewson and Elder, Assistant Engineers, Mr. Elder, however, was not called into the service, until the surveys of the Columet had been completed.

Two feeders from the Kankakee river were surveyed; one commencing at the dam near Wilmington and terminating near lock No. 6 on the main line of canal, and the other at Goose Island, terminating at the main line nearly opposite the upper part of the town of Kankakee. The feeder from Wilmington would be received into the canal on the Joliet level, and the other upon the Dresden level; the former being 10.43 and the latter 4.44 miles in length.

The feeder from Wilmington is rendered expensive by the necessity of constructing more than a mile of it where the base of the tow path will be in the river and the outer slope will require protection, and also by the difficulty of procuring suitable earth for embankment for about three miles of the distance, and the expensive nature of the embankment across the valley of the Desplaines.

The aqueduct across the Desplaines on this line will also be an expensive structure. The estimated cost of this feeder is $159,401.52.

The lower Kankakee feeder commences at a point very favorable to the construction of a permanent dam, and the route passes over ground well adapted to the cheap and permanent construction of the work, until it reaches the Desplaines river, which must be crossed by an aqueduct that will form much the most expensive part of the work. Every part of this feeder, however, can be made permanent at a very moderate cost, the whole estimate amounting to but $48,363.68.

The feeders are all intended to be navigable and will be 40 feet wide upon the surface of the water, 26 feet wide upon the bottom, and 4 feet deep, except lower Kankakee feeder, in which the water is intended to be 5 feet deep. The slopes of the banks will be two to one, and they will be raised 7 feet above bottom or 3 feet above the top water line. A declivity of 2 inches per mile is given on each of the feeder." (Canal Com. Rep., 1900, p. 219.)

FROM E. W. WILLARD'S HISTORY, IN REPORT OF 1900:

"The Kankakee feeder has not been used for several years. The aqueduct that carried the water over the Desplaines and Du Page rivers has long since gone to decay. There are, however, over 125 acres of good land used for this feeder that now belongs to the State of Illinois." (Canal Com. Rep., 1900, p. 220.)

6454 "In the years 1847 and 1848 Artemus J. Mathewson, a surveyors and engineer, under the authority and direction of the Canal Trustees, surveyed and marked the lines of the 90-foot strip on each side of the canal

from one end thereof to the other and prepared and filed in the office of the Board of Trustees, maps and profiles of said survey." (Can. Com. Rep., 1900, p. 229.)

6457 "The Mathewson survey of 1847 and 1848 gave the width of the canal and the lines of the reverse the entire length of the canal. See plat books 1, 2 and 3 canal records. From La Salle to Joliet the towing path is located on the south side of the canal, and from Joliet to Bridgeport it is on the north side. From Bridgeport to the center of Section 21, Tp. 14 N., R. 14 East, there was reserved from sale 16 feet in width on the south side of the Chicago river for towing purposes, and for a long time this reserve was used for that purpose. The State of Illinois secured title to the canal, its feeders and reserved land through Section 16, known as school sections, Ottawa Center, Marseilles, Joliet, Lemont and Canalport section (30-39-14), by the congressional acts of 1822, 1827, and 1831, and the legislative enactments of 1823, 1829, 1831, 1836, 1837 and 1839. See also La Salle County, Will County and Canal Records 1836 to 1845." (Can. Com. Rep., 1900, p. 235.)

4684 Counsel for defendant then offered in evidence a volume containing the issues of the Chicago American published in the years 1835 and 1836, in Chicago, Illinois; a weekly paper; from the issue of May 14, 1836, of this paper, an advertisement appearing therein and reading as follows: The heading of the advertisement is:

"1836

Western Transportation.

The New York and Oswego Line.

The proprietors of the above line will be prepared on the opening of navigation to forward property from New York by the Eckford Line of tow-boats to Albany daily; thence by the above line of canal boats daily to Oswego, and thence by steamboats and vessels of the first class to any point on Lake Ontario and via the Welland Canal to all ports on the upper lakes. William Sabine having connected himself with a line of transportation wagons from Chicago to the head of Navigation on the Illinois River will forward goods consigned

4685 to him by the above line to any point on the Illinois River or St. Louis."

There is a date under that: "March 28th."

Then signatures:

"R. J. Van Dewater, New York.
Johnston Howlett & Co., Foot of State Street, Albany, Up Stairs.
Henry Fitzhugh, Oswego, (Proproprietors)

Refer to A. B. Meech and Co., Herriman and Nash, Doremus, Suydam and Nixon, and S. Grosvenor and Co. New York: Meech, Jackson and Co., Albany; Sulter Livingston and Co., Utica; B. B. Hyde and Co., Rome; Noble and Palmer, Manlius; Dan'l Spencer and Co., Syracuse; Buckley and Clark, Sacketts Harbour; J. W. Fuller and Co., Alexandria Bay; White and Hooker, Morristown; R. T. C.; Truax and Phillips, Kingston, U. C.; E. P. and D. Smith, W. Barnham, Port Hope; A. Land and D. C. Gunn, Hamilton, U. C.; H. and S. Jones, Brockville, U. C.; Tracy and Harrison, Erie, Penn.; T. Richmond and Co., Richmond, Ohio; John E. Lyon, Cleveland; J. W. and T. Wickham and J. Fleeharty, Huron, Ohio; M. L. Babcock and Co., Sandusky; John W. Smith, Perrysburg; John L. Whiting, Detroit.

William Sabine, Chicago.

R. J. VanDewater, agent,
Corner of Water and Broad Sts., New York."

4686 Counsel for defendant then offered:

"The same advertisement appearing in the issue of May 21st, 1836, of this same paper; and also in the issue of May 28th, 1836, of this same paper."

Counsel for defendant then produced another volume containing the issues of the Daily Chicago American published in the year 1839; and offered in evidence from the issue of this paper published September 14, 1839, the following advertisement:

"Notice to Travelers.

The traveling public are informed that the mail stage from Chicago to Galena leaves the general stage office at Chicago every Sunday, Tuesday and Thursday and arrives at Galena every Monday, Wednesday and Friday, making it through in two days, and fare reduced to $12.50 for a distance of 156 miles. Fare from Rockford to Chicago $6. Mail stages leave for Dixon's Ferry
4687 every Monday, Wednesday and Friday, and for Naperville, Warrenville, Geneva and St. Charles same days and return every Tuesday, Thursday and Saturday. From St. Charles the mail line is continued on direct, three trips a week, for De Kalb, Court House, then to Oregon City and Buffalo Grove and there connects with the Peoria and Galena Mail stage, making the line direct to Galena. The mail stage for Milwaukee leaves the general stage office at Chicago every Sunday, Tuesday and Thursday and returns every alternate day. Last, though not least, a daily mail stage leaves the above named office for Peoria and makes the trip from Chicago to Peoria, 170 miles in from 30 to 35 hours, by steamboats and stages—stages from Chicago to Peru and steamboat from Peru to Peoria. Fare, whole distance, $11, and found on board the boat. This line passes through Lockport, Juliet, Ottawa and Utica to Peru.

Extras furnished at all times for nine seats at regular fare. The proprietors will spare no pains to make the traveler comfortable, and safe, and hope that if they do justice to the public, by the public they will be supported.

(Signed) E. C. STOWELL,
Agent for the Proprietors.'

Dated, 'September 4th.'

4688 It is stipulated by counsel that the same advertisement as last read appears in each issue of the Daily Chicago American published after September 14, 1839, up to and including the issue of November 9, 1839.

AT A SUPREME COURT, Begun and held at Springfield on Tuesday, the Fifth day of October in the year of our Lord One Thousand Nine Hundred and Nine, within and for the State of Illinois.

Present:

WILLIAM M. FARMER, *Chief Justice,*
JAMES H. CARTWRIGHT, *Justice,*
ALONZO K. VICKERS, *Justice,*
FRANK K. DUNN, *Justice,*
JOHN P. HAND, *Justice,*
ORRIN N. CARTER, *Justice,*
GEORGE A. COOKE, *Justice,*
WILLIAM H. STEAD, *Attorney General,*
WARREN C. MURRAY, *Bailiff.*

Attest:

J. MCCAN DAVIS, *Clerk.*

Be It Remembered, that afterwards, to-wit, on the 26th day of October, 1909, the opinion of the Court was filed in the words and figures following to-wit:

People *ex rel.* C. S. Deneen, *Appellant,*
No. 6242 *vs.*
Economy Light & Power Co.
} Error to Appeal from Circuit Court, Grundy.

Docket No. 6242—Agenda 1—June, 1909.

People of Illinois *ex rel.* Charles S. Deneen and William H. Stead, Appellant *vs.* Economy Light and Power Co., Appellee.

Mr. JUSTICE VICKERS delivered the opinion of the court:

This is a direct appeal to this court from a decree of the circuit court of Grundy county dismissing for want of equity an information in the nature of a bill in equity filed by the Attorney General on behalf of the People, on the relation of Charles S. Deneen, Governor of the State of Illinois, against the Economy Light and Power Company, to restrain said company from erecting a dam across the Desplaines river and to cause the removal of that portion of the dam already constructed, and to prevent other injuries to the prop-

erty of the State which it is alleged will result from the construction and maintenance of said dam.

Appellant bases its claim to relief on three propositions, as follows: (1) That the State of Illinois owns the bed of the river at the point where it is proposed to build said dam; (2) that the Desplaines river is a navigable stream, and that the proposed dam would constitute an obstruction to navigation; (3) that certain contracts executed by the commissioners of the Illinois and Michigan canal, under which appellee claims certain rights in connection with the construction of said dam, are void, and that no rights were acquired by or can be asserted under said contracts.

It is conceded by appellee that if the State of Illinois owns the fee in the bed of the Desplaines river at the point where the proposed dam is to be located, or if said river is a navigable stream at that point, appellee has no right to build the dam. Whether the same result would follow if the instruments referred to in the third proposition were held invalid is one of the controverted questions between the parties. The questions involved in each of appellant's propositions arise out of facts which have but little, if any, bearing on the other contentions. It will therefore conduce to a clearer understanding to examine these propositions separately, in the light of the facts applicable to each.

THE TITLE OF THE STATE TO BED OF THE RIVER.—The validity of appellant's claim of title to the bed of the river at the point where the dam is located depends upon the construction of certain statutes passed by the legislature in relation to the Illinois and Michigan canal. The consideration of the legal questions involved in appellant's claim of title to the bed of the river will be facilitated and the ultimate result clarified by a brief review of the history of the Illinois and Michigan canal prior to the passage of the particular statute a construction of which is involved in this question.

The possibility of connecting the waters of Lake Michigan with the Illinois river by means of an artificial channel, thence through the Mississippi river to the Gulf of Mexico, thus establishing a continuous waterway for commerce from the lakes on the north to the gulf on the south, was at a very early time appreciated and its consummation cherished by the early traders and explorers as a work of first importance, both from a commercial and military standpoint. The portage between the south branch of the Chicago river and the Desplaines was only a few miles, and it was confidently be-

lieved that these two streams could be connected by an artificial channel at a cost that would be trifling in comparison with the commercial benefits that were expected to result. Experience has shown, however, that the cost of the canal, first and last, has been nearly twenty times the original estimate and that its practical benefits have fallen much below its promoters' expectations. The subject of constructing the canal was first brought to the attention of the Federal Congress in 1801 by Albert Gallatin, in a report recommending its construction by the general government. In 1816 a government survey was made of the proposed route, and after Illinois was admitted into the Union the attention of the new State was turned to the proposed connecting waterway. In 1822 Congress passed an act authorizing the State of Illinois to survey and mark through the public lands of the United States the route of a canal connecting the Illinois river with the southern bend of Lake Michigan, and vesting in the State the perpetual use of a strip of land ninety feet wide on each side of said canal for canal purposes, subject to certain conditions which have either been complied with or waived by subsequent acts and therefore need not be stated. (Stead's Canal Laws, p. 1.)

During an extra session of the Illinois legislature, in 1826, a memorial was addressed to the Congress of the United States in which the great advantages, both to the nation and the State, of the proposed canal were eloquently set forth and the liberality of Congress was appealed to to make a grant of public lands to aid the State "to commence and complete this great and useful work." In this memorial it was stated that "your memorialists have caused the route to be explored and estimates to be made of the probable expense of the work, from which it appears that the cost of constructing the canal will not be less than $600,000 and may possibly amount to $700,000." The effect of this memorial was to attract the attention and awaken the generous patronage of the Federal Congress, and on March 2, 1827, an act was passed granting to the State of Illinois, for the purposes stated, a quantity of land equal to one-half of five sections in width on each side of said canal, from one end thereof to the other. The lands thus granted to the State, when selected and set apart, were found to contain approximately 300,000 acres, which were subject to the disposal of the State legislature "for the purposes aforesaid and no other." In 1829 the legislature passed an act authorizing the appointment of

a board of canal commissioners to explore, examine, fix and determine the route of the canal, and dispose, by sale, of the lands and lots and commerce the work. Under this act Gov. Edwards appointed Charles Dunn, Dr. Gersham Jayne and Edmond Roberts as commissioners. For lack of funds the commissioners were able to accomplish but little. February 15, 1831, an amendatory act was passed. Under the provisions of these two acts the board of commissioners laid out the towns of Chicago and Ottawa and caused a new survey and estimate to be made by engineer Bucklin, whose estimate showed that the canal, instead of costing $600,000 or $700,000, as the legislature had stated in its memorial, would cost $4,043,386.50,—and this estimate proved to be too low by half. In view of the unexpected increase in the cost of the canal the plan of substituting a railroad for the canal was favorably considered for a time, and with this in view a survey and estimate for the railroad were made, a law passed abolishing the office of canal commissioners and the consent of the Federal government to use the land granted in constructing a railroad instead of a canal was obtained.

In 1835 the canal proposition was again taken up and an act passed authorizing the Governor to negotiate a loan, not exceeding $500,000, solely on the pledge of the canal lands and tolls. Certificates were to be issued, called "Illinois and Michigan canal stock," which were to be sold at not less than face value. This effort to raise money proved a failure. Ex-Gov. Coles, who then resided at Philadelphia, was appointed agent of the State to negotiate the loan, and in April, 1835, he wrote that capitalists were unwilling to take the stock certificates because they were not based upon the faith of the State. To obviate the objections thus raised the act of January 9, 1836, was passed, which repealed the act of 1835 and authorized the same loan of $500,000 on the credit of the State, which was irrevocably pledged for the payment of both principal and interest. The money thus borrowed, together with the proceeds of canal lands and lots, constituted a fund with which the actual construction of the canal was commenced, and on July 4, 1836, ground was first broken for the canal.

Two general plans of construction had been estimated and recommended. One, which is described as the "deep-cut" plan, provided for a channel six feet below the water level of Lake Michigan, and contemplated the maintenance of a channel sixty feet wide at the top and forty feet at the bottom and

a depth of six feet, supplied by the direct flowage of water from Lake Michigan. The cost of the canal under the deep-cut plan was estimated at more than $10,000,000. This excess in cost over the available funds led to the consideration and adoption of the "shallow-cut" plan, which provided for a channel twelve feet above the water level of Lake Michigan, and contemplated to supply the channel with water by feeders from the Calumet or Desplaines river. Up to the first of January, 1839, the gross expenditures on the canal derived from loans and the sale of lands and lots amounted to $1,400,000. All of the canal, except about twenty-three miles between Dresden and Marseilles, was under contract, and the jobs let were roughly estimated at $7,500,000. In this situation the legislature directed the commissioners to borrow $300,000 and the Governor to make a further loan by the sale of $4,000,000 of State bonds. These bonds were disposed of to irresponsible parties, some of whom paid a portion, others practically nothing, so that the State lost several hundred thousand dollars in the sale of these bonds.

On February 26, 1839, the General Assembly passed an act which is of special importance in this connection, since it is upon this act appellant rests its claim of title to the bed of the river at the point where the proposed dam is located. Section 1 of the act of 1839 provided that the sales of canal lands and town lots heretofore authorized by law shall be regulated as follows: Under the title of "conditions of sales" it was provided: "In all sales of lands and lots under the provisions of this act the following conditions shall be annexed and shall compose part of the contract." By condition 9 it is provided as follows: "That no stream of water passing through the canal lands shall pass by the sale so as to deprive the State from the use of such water, if necessary to supply the canal, without charge for the same." Condition 11 is as follows: "Lands situated upon streams which have been meandered by the surveys of public lands of the United States shall be considered as bounded by the lines of those surveys and not by the stream." At the time this act was passed the State of Illinois owned the lands on both sides of the Desplaines river where the dam in question is located. If the title to this land had passed out of the State under the act of 1839 there would be much force in appellant's contention that the riparian owners would only obtain title to that portion of land within the meander lines, the effect of which would be to reserve the title to the bed of

the stream in all odd numbered sections bordering upon either side of the river in the State, and this, as we understand, is appellant's position.

The proposed dam is located in the south-east quarter of section 25, township 34, range 8, east of the third principal meridian, in Grundy county. Section 25 was one of the sections embraced in the government grant of 1827. Both parties concede that the title to the bed of the stream passed to the State under the government grant. The point at issue between the parties is whether such title passed out of the State when it sold said south-east quarter of section 25, or whether the grantee only took title to the meander line, as is provided by condition 11 in the act of 1839.

Returning again to the further history of the canal, we find that, owing to the panic of 1837 and the general shrinkage of values, the State was seriously embarrassed and its credit impaired. At this time $1,000,000 of State bonds bearing six per cent. interest were sold in London for eighty-five cents on the dollar. In 1841 the State defaulted in the payment of interest on her public debt and her financial embarrassment became alarming. The situation was greatly aggravated by the collapse of the State banks, in 1842. The State refused to take State bank paper for taxes, and the taxpayers did not have coin or the means of procuring it. There was a general stagnation in business and values rapidly declined. The State at that time owed $14,000,000, on which it was unable to pay interest. Repudiation was openly advocated, and for a time "the fair name of Illinois became freely associated with dishonor." There was a crisis in the affairs of the State as well as in the affairs of the projected canal. Strange as it may seem, the Illinois and Michigan canal, in aid of which the credit of the State had been pulled down, was now confidently looked to as the only means of lifting it up. It was argued the advantages and facilities to be afforded by it would cause immigrants and wealth to pour into the State. To meet the dire situation and to insure the completion of the canal, Justin Butterfield, of Chicago, first suggested the idea of inducing the holders of canal bonds to advance the money for its completion upon the pledge of the canal, its lands and revenues to the bondholders in the nature of a first mortgage, and Gov. Ford recommended the adoption of this plan in his first message to the General Assembly. Accordingly, on February 21, 1843, the legislature passed an act authorizing the Governor to negotiate a

loan of $1,600,000 solely on the credit and pledge of the canal property, its tolls, revenues and lands, for a term of six years, bearing six per cent. interest. Said act provided that the holders of canal bonds and other evidence of indebtedness of the State, for the purpose of aiding in the construction of the canal, should be first entitled to subscribe for said loan in proportion to the amount held by the several creditors. It was provided in said act that a board of canal trustees should be appointed, to be known and designated as the "Board of Trustees of Illinois and Michigan Canal," one of whom should be appointed by the Governor and the other two elected or appointed by the subscribers to the said loan. Section 10 of said act provided that for the purpose of placing in the hands of the trustees full and ample security for the payment of said loan, and the interest thereon, and for the purpose of securing a preference in the payment of the debts held by the persons who would subscribe for the new loan, the "State does hereby irrevocably grant to the said board of trustees of the Illinois and Michigan canal the bed of the said Illinois and Michigan canal and the land over which the same passes, including its banks, margins, towpaths, feeders, basins, right of way, locks, dams, water power, structures, stone excavated and stone material quarried, purchased, procured or collected for its construction, and all the property, right, title and interest of the State of, in and to the said canal, with all the hereditaments and appurtenances thereunto belonging or in anywise appertaining, and also all the remaining lands and lots belonging to the said canal then or which hereafter may be given, granted or donated by the general government to the State to aid in the construction of said canal, and the buildings and erections belonging to the State thereon situated; the said board of trustees to have, hold, possess and enjoy the same as fully and absolutely, in all respects, as the State now can or hereafter could do, for the uses, purposes and trusts hereinafter mentioned." The only property excepted from this act were "all canal lands and lots heretofore sold by the board of commissioners upon which moneys are now due or may hereafter become due," which were reserved to the State. After considerable delay and difficulty the creditors of the State finally advanced $1,600,000 on the faith of the act of 1843, and the final completion of the canal was at last an assured fact.

On June 26, 1845, Thomas Ford, as Governor of the State of Illinois, executed a deed to William H. Swift, David Leavitt

and Jacob Fry, trustees of the Illinois and Michigan canal, under authority vested in him by section 21 of the act of 1843, conveying to said trustees, in the language of said act, all of the canal property which the State then owned, including "the lands and lots remaining unsold, donated by the United States to the State of Illinois to aid in the completion of the said canal, * * * to have, hold and enjoy the said property, with the right of controlling, managing, selling and disposing of the same." There is no restriction in the act itself, or in the deed made by the Governor under it, which lends support to appellant's claim that the bed of the river was reserved to the State.

On October 22, 1860, the canal trustees sold and conveyed to Charles E. Boyer, for a consideration of $1556, 196.61 acres of land in section 25, township 34, range 8, in Grundy county, and by *mesne* conveyances the title of said tract is now vested in appellee. The proposed dam is located wholly on this tract. Conveyance to Boyer was made by the canal trustees "under authority vested in said board by an act of the legislature of the State of Illinois of February 21, 1843, entitled 'An act to provide for the completion of the Illinois and Michigan canal and for the payment of the canal debt.'" which authority is recited in the fact of the deed itself. The granting clause of said deed is as follows: "In consideration thereof and the premises, said board of trustees of the Illinois and Michigan canal has granted, bargained and sold, and by these presents do grant, bargain and sell, to the said Charles E. Boyer, the said tract of land above designated and described." The following is the *habendum* clause of the said deed: "To have and to hold the same, together with the rights, privileges, immunities and appurtenances thereunto belonging, unto the said Charles E. Boyer, his heirs and assigns forever." There are no exceptions, limitations, reservations or conditions in this deed. If the title to the bed of the stream did not pass by this deed it is because the trustees had no power to convey it.

Under the government grant of 1827 the State obtained title to all of section 25, including the bed of the river through that section. By the act of 1843, and the deed of the Governor made thereunder, the title to all of the unsold portion of said section passed to the trustees of the Illinois and Michigan canal, and by their deed the title to the southeast quarter of said section on which the dam is located was vested in Boyer, and his title, as we have seen, now rests in the appel-

lee. Under well established rules of law these several conveyances carried the title to the bed of the stream, in the absence of any language clearly denoting an intention of stopping at the edge of the river. (*Braxon* v. *Bressler,* 64 Ill. 488; *Davenport Bridge Railway Co.* v. *Johnson,* 188 id. 472.) There is no difference in the application of this rule between navigable water-courses and those which are not navigable. In grants upon navigable waters above tide waters the riparian owner takes title to the thread of the stream, subject to an easement in the public for the purpose of navigation, while as to the waters not navigable the title to the bed of the stream passes absolutely, free from any burdens in favor of the public. (*Washington Ice Co.* v. *Shortall,* 101 Ill. 46.) Where a riparian proprietor owns the land on both sides of a river, he is the owner of the whole of the bed of the stream to the extent of the length of his lands upon it. (Angell on Water-courses, sec. 5.) This is the rule of the common law, which has been adopted in this State and applied by this court to the Mississippi river in *Middleton* v. *Pritchard,* 3 Scam. 510; to the Rock river in *Braxon* v. *Bressler, supra;* to the Chicago river in *City of Chicago* v. *McGinn,* 51 Ill. 266; to the Calumet river in *Washington Ice Co.* v. *Shortall, supra;* and to the Desplaines river in *Board of Trustees* v. *Haven,* 5 Gilm. 548, and *Druley* v. *Adam,* 102 Ill. 177. The general rule is, that when riparian estates are conveyed the owner may reserve the land under water; but the general presumption is that the purchaser's title extends as far as the grantor owns, in both tidal and fresh waters. (Gould on Waters, sec. 195, and cases there cited.) There is nothing in any of the conveyances concerning the south-east quarter of section 25 to indicate an intention to reserve that portion of said land in the bed of the Desplaines river. On the contrary, the language of the act of 1843, and the deed of the Governor made in pursuance thereof, is so broad and comprehensive as to preclude the State from asserting title to the bed of this stream. Anything found in the act of 1839 manifesting an intention of the State at that time to limit sales of canal lands within the meander lines of the Desplaines river must be held inconsistent with the comprehensive language of the act of 1843 and superseded thereby. We do not, however, mean to be understood as holding that the act of 1839 was superseded in its entirety by the act of 1843, but we do hold that as to sales made under the act of 1843 to procure money with which to pay debts created thereunder, such

sales were not affected by the limitations in the act of 1839. After the trust created by the act of 1843 was executed and the debts for which the canal properties were pledged under that act were paid and the canal properties turned back to the State in accordance with section 9 of the act of 1843, any subsequent sales of canal lands would not be controlled by the act of 1843. The record shows that at the time the lands on which the dam in question is located were sold the debt was not fully paid, and the deed executed by the canal trustees shows by its recitals that it was made under the power conferred by the act of 1843. Deeds made by the canal trustees under the act of 1843 to lands bordering on the Desplaines river conveyed the title to the purchaser to the thread of the stream.

Appellant also contends that since the undisputed evidence shows that the Desplaines river was meandered by the government surveyors, such meander line is the boundary of riparian proprietors. A meander line is not a boundary line, but is designed to point out the sinuosities of the bank or shore and a means of ascertaining the quantity of land in the fraction which is to be paid for by the purchaser. (*Whitaker* v. *McBridge*, 107 U. S. 510; *Albany Railroad Bridge Co.* v. *People*, 197 Ill., 199.) An exception to this general rule seems to be recognized where the meander line is run and monuments are erected, but in the case at bar the evidence fails to show that any monuments were erected on the meander line, hence this case falls within the general rule and not within the exception. The State of Illinois is not the owner of the bed of the Desplaines river at the place where the proposed dam is located.

The Navigability of the Desplaines River.—The question which has received the most exhaustive treatment by counsel relates to the navigability of the Desplaines river. The evidence introduced upon this question fills more than one thousand printed pages in the abstract, and to its discussion counsel have devoted several hundred pages of their briefs. If the dismissal of the bill by the court below had been without prejudice to the right of the State to renew its application for an injunction such action on the part of the court below might be sustained because of the utter failure of appellant to prove that the construction of the proposed dam will be an obstruction to the present navigation of the river. There is no proof that the river is now being used as a public highway for commerce. On the contrary, the evidence not

only shows that the river is not being so used, but it shows affirmatively that, owing to the presence of numerous other dams and some fifty or more bridges which span the river, it would be impossible, under existing conditions, to navigate the same. There being at present no navigation whatever upon the river, obviously the dam in question cannot be said to be an obstruction to navigation that has no existence in fact. But the decree of the court below dismissed the bill for want of equity, without reserving any right to the State to renew this application for relief on the ground that the dam in question was being erected in a navigable stream, and rendered a final decree based on the finding that the river is not navigable, settling this question not only for the present but for all time to come, so far, at least, as the parties bound by this decree are concerned. We regard the question, therefore, as properly presented for our consideration on its merits.

The Desplaines river has its source in the south-eastern part of Wisconsin, and flows in a southerly direction, almost parallel with the western shore of Lake Michigan, through the counties of Lake and Cook, in this State, until it reaches a point nearly opposite the western end of Forty-seventh street, in the city of Chicago, where the river curves and takes a south-westerly course, passing the cities of Lockport and Joliet, and thence to a point in Grundy county, where it unites with the Kankakee river, thus forming the Illinois river. The entire length of the river is something over one hundred miles, but in determining the question of its navigability we will have no occasion to consider that portion of the river above Riverside, since it is not contended that that portion of the river is or ever has been navigable. The maintenance of the charge in the bill that the river is a navigable stream does not impose on appellant the burden of showing that the stream was navigable in its entirety, (*Schulte* v. *Warren*, 218 Ill. 108,) or that the navigable portion of such stream was open for use all the year round. (*Pierpont* v. *Lovelace*, 72 N. Y. 211; *Burke Co.* v. *Catawba Lumber Co.* 116 N. C. 731.) Appellant contends, and appellee seems to concede, that if it is established that the Desplaines river is navigable from Lockport to its mouth the decree of the circuit court should be reversed, even though the court might be of the opinion that the river was not navigable at any other place. We have no doubt of the correctness of this proposition as an abstract statement of the law. We will therefore

confine our consideration of this question primarily to that stretch of the river, about nineteen and one-half miles in length, extending from Lockport to the mouth of the river.

The evidence shows that there is quite a fall in certain portions of the river between these two points. From Lockport to Joliet there is a fall of thirty feet in a distance of four and one-half miles, and from dam No. 1 in Joliet to the head of Patterson's island there is a fall of twenty-one feet in three and one-half miles. Then there is a stretch of about five miles, known as Lake Joliet, in which there is practically no fall. Below the foot of Lake Joliet the river divides and forms what is called Treat's island. Going down the river the main channel is on the left of the island, and there is a fall of nine and one-half feet in one mile. After passing Treat's island the river is again united and forms a pool or lake about one mile long in which there is very little fall. Going down the river the next stretch, at a point called Smith's bridge there is a fall of about two and seven-tenths feet in one mile. Passing the rapids at Smith's bridge another pool is encountered, called Lake DuPage, where there is a fall of two feet in three and one-half miles. In the last half mile above the mouth of the river there is a fall of three and one-half feet. It is across the lower end of this stretch that the proposed dam is located. The bottom of the river from Lockport to the dam in question, with the exception of that portion under Lake Joliet, is covered with a large number of bowlders. The bottom of Lake Joliet is soft. The evidence shows that these bowlders are of various sizes, some of them between two and three feet in diameter. Some of them are covered entirely with water, while others project slightly above the surface of the water. It is also shown that in going down the river in a skiff or any kind of boat there is great danger of coming in contact with these bowlders. The current is so strong that it is not possible to row a boat up stream over these rapids. In addition to the natural barriers already spoken of, the evidence shows that the stream is tortuous and the channel very narrow at places. The slopes in the river already given do not represent the greatest fall that can be found in this stretch. The evidence shows that there is near the head of Treat's island a fall of seventeen feet to the mile, and near the foot the slope is eighteen feet to the mile, and in the right-hand channel opposite Treat's island there is a space of five hundred feet in which the fall is fifty feet to the mile, and if shorter distances are taken even

greater slopes than these will be found to exist. At one place near the mouth of the river there is a fall for three or four hundred feet of twenty feet to the mile. Between the mouth of the river and Lockport there are thirteen bridges across the river, none of which have draws to permit the passage of boats, if such passage were otherwise possible. Two of these bridges are railroad bridges, and all of them are permanent steel structures. Above Lockport there are some forty other bridges across the stream, constructed for steam or electric railroads and for wagons. The width of the river varies greatly. At some places it is not more than sixty feet wide, while in the widest place in Lake Joliet it is over one thousand feet wide. The evidence shows that the depth of water in the river varies considerably in different places and also at different times in the same places. A chart showing the gauge readings at Riverside, a point twenty-eight miles above Joliet, shows the number of days in each year during which the river was dry at this point, which indicates that there were from twenty-four days in 1890 to two hundred and thirteen days in 1895 during which the river was dry at this point. This chart also shows the number of days during each of these years when there was a discharge of less than six inches of water at Riverside, the result of which is, totaling the number of dry days and the days showing less than a six-inch discharge, that there were from one hundred and twenty days in 1888 to three hundred days in 1901 when the river was either dry or showed less than six inches of water at Riverside. The depth of the river during the balance of the year is not shown on this chart. These gauge readings also show that the dry or low periods did not occur during the same time in each year. Every month in the year is represented several times during the years covered by this chart, from which the conclusion is drawn that there were no regular periods when a given stage of water could be safely expected.

We refer to the readings on the Riverside gauge, not because of their bearing on the question of navigability at that point, but for the reason that they tend to show the natural volume of water in the channel above the points where the volume is increased by the additions made by the Illinois and Michigan canal and the drainage channel, which added from 250,000 to 400,000 cubic feet of water per minute to the river below the point of connection.

Appellant strongly contends that the rights of appellee as

riparian owner are to be determined with reference to the conditions that exist since the deepening of the Illinois and Michigan canal and the construction of the sanitary district channel, by means of which the volume of water in the Desplaines river has been greatly increased. It is argued that the navigability of the river is to be determined with reference to the changed condition and not as the stream existed in a state of nature. Appellant's position, as we understand it, is this: Assuming the stream to be unnavigable in its natural condition, the State may by artificial means so change the stream as to make it navigable and thus destroy the vested property rights of riparian owners upon the said stream. This position is untenable. The property rights of riparian owners in the bed of an unnavigable stream are as sacred as any other property right, and such owners cannot be deprived of those rights, without compensation, by artificial additions to the waters of the stream whereby it is rendeerd navigable. To hold that the State can by artificial means make a stream navigable which in a state of nature was not navigable, and thereby deprive riparian owners of their property rights in the bed of the stream, is simply to hold that private property may be taken or damaged for public use without compensation.

The contention of appellant upon this question is contrary to the authorities. In *Thunder Bay River Booming Co.* v. *Speechly,* 31 Mich. 36, the court, speaking by Judge Cooley, upon this question said: "No such inference is warranted by the decisions. The highway they recognized is one *sui generis* and in which the public rights spring from peculiar facts. It is a public highway by nature, but one which is such only periodically and while the natural condition permits of a public use. * * * But at periods when there is no highway at all there is no ground for asserting a right to create a highway by means which appropriate or destroy private rights. The doctrine that this may be done without compensation to parties injured is at war with all our ideas of property and of constitutional rights. The most that can be said of this stream during the seasons of low water is, that it is capable of being made occasionally navigable by appropriating for the purpose the water to the natural flow of which the riparian proprietors are entitled. It is highly probable, in view of the large interests which are concerned in the floatage, that the general public good would be subserved by so doing, but this fact can have no bearing upon the legal ques-

tion. It is often the case that the public good would be subserved by forcing a public way through private possessions, but it neither should be nor can be done, under any circumstances, without observing the only condition on which it can be permitted in constitutional government, namely, that the private proprietor be compensated for the value which he surrenders to the public."

In *Druley* v. *Adam, supra,* this court, in speaking of the added volume of water to which the proprietors of the Haven dam were entitled by reason of the deep cut in the Illinois and Michigan canal, said (p. 206): "It may be quite true that appellee has now more water than he had before the deepening of the Summit level, and that contrasting his condition now with his condition then he is not injured, but he is entitled, by virtue of his position as lower proprietor, as has been shown, to the benefit of all improvements whereby the flow of the water in the river is increased, and this property right cannot be taken from him without his consent. The right which the lower riparian proprietor has to avail himself of all benefits resulting from improvements by upper riparian proprietors is obviously a property right growing out of the nature and necessities of flowing water and his position upon the stream, and of which, therefore, he can no more be deprived, without his consent, than of any other property right."

The rule that the navigability of the stream is to be determined with reference to its natural condition is supported by the numerous other authorities: *Hall* v. *Lacy,* 3 Grant's Cas. 264; *Carter* v. *Thurston,* 58 N. H. 104; *Ellis* v. *Collee County,* 70 Ala. 490; *Straton* v. *Currier,* 81 Me. 497; *United States* v. *Rio Grande Dam and Irrigation Co.* 174 U. S. 690; *In re Ball,* 10 Wall. 557; *In re Montello,* 20 id. 431.

We are aware that there is a line of cases which at first blush may appear to be in conflict with the rule laid down in the authorities above cited. While the rule is well founded, both upon reason and authority, that a stream not navigable in its natural condition cannot be made so by artificial means, so as to deprive riparion owners of vested rights without compensation, it is equally well established that a stream which is, in fact, navigable in its natural state may be improved for the purpose of enlarging its usefulness, and the public will have a right to the enjoyment of the easement in its enlarged condition. It is to this principle that the cases of *Schulte* v. *Warren, supra,* and *Mendota Club* v. *Anderson,*

101 Wis., 479, and other like cases relied on by appellant, are to be referred. There is nothing in this line of decisions that is in conflict with the rule stated above or the authorities cited in support thereof. In view of the constitutional inhibition against the taking or damaging of private property for public use without compensation, the rule must, of necessity, be that the State cannot directly by its own act or indirectly through the act of any of its agents change an unnavigable stream to one that is navigable, and thereby destroy or damage the private property rights of adjacent owners, without making compensation. The State can no more establish a waterway over private property without compensating the owners than it can build a railroad or a public highway over farm lands without paying for the right of way and all damages to property not taken. The same constitutional provision that protects property rights in real estate above the water line of an unnavigable stream extends to and protects that which is below the water, guaranteeing the same full measure of enjoyment to the owner in the one case as well as in the other. The view is supported by the decision of this court in *City of Chicago* v. *Laughlin*, 49 Ill. 172, where, on page 177 of the opinion, the following language is used; "It would be monstrous that the city should, at pleasure, make changes in this stream so as to render buildings on the wharves an obstruction and then require their removal without compensation. Such power would be more vast and absolute than can be exercised by the State itself. The city government is created and has its power delegated for the better protection of individual rights, and not that they may be disregarded or destroyed."

The widening or deepening of navigable streams, or the improvement of those which are not navigable so that they may become so, or the construction or improvement of harbors, are works of a public nature, conferring benefits on the public at large. Such improvements may be made and paid for out of the general treasury, from funds raised by taxation. The Supreme Court of the United States, in *County of Mobile* v. *Kimball*, 102 U. S., 691, decided that the State might authorize a county to improve a public harbor, to be paid for by bonds which were ultimately to be paid by general taxation upon property of the county. (See Page & Jones on Taxation by Assessment, sec. 360.) But under the law of this State as laid down in *City of Chicago* v. *Law*, 144 Ill. 569, a navigable stream cannot be improved and the cost

thereof levied by a special assessment upon the real estate fronting upon such water-course. In that case an attempt was made by the city of Chicago to improve the south branch of the Chicago river and to charge the cost of such improvement by a special assessment against the lands and lots fronting on the same, and this court, in denying the power of the State to make such improvement by a special assessment, on pages 576 and 577, said: "The river is a navigable stream of the United States. It connects with Lake Michigan, and by means of the lake with the country at large. The Federal government has assumed jurisdiction over it, and expended money, as appears from the admitted facts, for its improvement. It is one of the channels over which the commerce of the country passes, and this improvement was instituted for the purpose of increasing its power as one of the navigable streams of the country. It was undertaken in the interest of the commerce of the country. Was it ever intended that a few land owners bordering on one of the navigable streams of the country should be compelled to pay for an entire improvement in a river, the object of which is to benefit the public at large rather than the locality where the improvement is made? Here the contemplated improvement was one to widen the river in order that boats and vessels might pass up and down the river with greater facility,—one calculated to increase the navigable qualities of the river,—an enterprise wholly public in its nature. If one of the cities located on the banks of the Mississippi river should undertake to remove obstructions from that navigable stream of water to enable boats to run up and down the river with greater facility and pay for the improvement by special assessment on property fronting on the river, it would not, we apprehend, be contended that an assessment of that character could be sustained under the provisions of the statute above cited; and yet there is no substantial difference between the supposed case and the one under consideration. The proposed improvement has none of the elments of a local improvement, such as incorporated towns and cities have been in the habit of making by special assessment."

If riparian owners cannot be specially assessed to pay for the improvement of a navigable stream, *a fortiori* they cannot be required to surrender valuable property rights, without compensation, in furtherance of a scheme to improve one that is not navigable in its natural condition. Much time and labor have been spent by appellant in presenting reports

of surveys, maps and engineering schemes for the improvement of this river, which, if carried out, would render the river navigable. But all this is not pertinent to the issue. The question is whether the river was navigable in a state of nature, and not whether it can be made so by artificial means.

It is also contended that the Sanitary District act declared this river to be navigable. This contention is based on a sentence in section 24 of said act, as follows: "When such channel shall be completed, and the water turned therein, to the amount of 300,000 cubic feet of water per minute, the *same* is hereby declared a navigable stream." Appellant's contention, under this statute, is thus stated in its brief: "The *same* means that the water flowing in that channel is a navigable stream. The water so turned in was navigable in fact, and it does not lose its navigability in passing out of the artificial channel into the channel of the Desplaines river. The water is just as navigable one-half mile southwest of Joliet as it is one-half mile northeast of Joliet." The argument is based upon an erroneous construction of the word "same." That term refers to the channel of the sanitary district and has no reference to the water after it leaves the channel.

But even if the legislature had declared in unequivocal language, that the Desplaines river was navigable, as it did by the act of 1907, such declaration could not have the effect of depriving appellee of vested rights as riparian proprietor, if such rights exist. The general doctrine upon this question is well expressed by the Supreme Court of Kentucky in *Murray* v. *Preston*, 106 Ky., 561, (90 Am. St. Rep., 232,) as follows: "The first question is, what is the effect of the act of the legislature declaring this creek a navigable stream? The constitution of the State forbids private property being taken for public use without just compensation being previously made. If the creek was not a navigable stream when this act was passed it was the private property of the owners of the adjoining lands. If it was the private property of appellant within the boundary of his land, the legislature could not divest him of his rights by simply calling it a navigable stream when it was not one in fact. The rule on this subject is thus stated in Cooley on Constitutional Limitations (side p. 591): 'The question what is a navigable stream would seem to be a mixed question of law and fact, and though it is said that the legisla-

ture of the State may determine whether a stream shall be considered a public highway or not, yet if, in fact, it is not one the legislature cannot make it so by simple declaration, since if it is private property the legislature cannot appropriate it to a public use without providing for compensation.' " And the same doctrine is announced in the following cases: *Walker* v. *Board of Public Works,* 16 Ohio, 540; *Morgan* v. *King,* 35 N. Y., 454; *Shenango Bridge Co.* v. *Paige,* 83 id., 178; *Martin* v. *People,* 5 Blackb., 35; *Olive* v. *State,* 86 Ala., 88 *People* v. *River Mill and Lumber Co.,* 107 Cal., 221; *Yates* v. *Milwaukee,* 10 Wall., 497; *Watkins* v. *Dorris,* 54 L. R. A., 199.

None of the legislative acts relied upon by the appellant were passed for the primary purpose of promoting deep water navigation from the lakes to the gulf by means of improving the channel of the Desplaines river. The various acts passed in the interest of the Illinois and Michigan canal, as well as the Sanitary District act, did not include any general scheme for the improvement of the Desplaines river. Up to this time no general plan for the deep waterway has been adopted, either by the State or the nation. Whether such enterprise will ever be attempted by either, separately or by the joint action of both, and, if such enterprise is entered upon, whether the plan will embrace the use of the old Illinois and Michigan canal or the sanitary district channel in connection with a part of the Chicago and Desplaines rivers or whether some new and entirely different channel will be adopted, are all legislative questions, with which the courts have no concern. Figuratively speaking, the waters have been much troubled on this subject, but so far neither the nation nor the State has legislated how they shall flow. What the future will see accomplished along these lines no one can know. It may be that when that future is unfolded it will bring a realization of the hopes of the most optimistic, and that the appearance of sea-going vessels plowing through the prairies of Illinois, laden with the people and products from the uttermost parts of the earth, will be as common as the now almost forgotten "prairie schooners" of 1849 were in those days. But if this transition is to occur,—if the powerful hands of the government are to lay hold of this gigantic enterprise,—they must do so with due regard to the sacred rights of every citizen, however humble and insignificant those rights may seem in contrast with the great public consummation.

What is a navigable stream is a question to which different courts have given different answers. In some of the States, where the lumber business was of great importance and the floating of saw logs an essential branch thereof, a stream that had the capacity for floating logs, though only for short periods in times of freshets, was held to be navigable. (*Brown* v. *Chadbourne,* 31 Me., 9; *Moore* v. *Sanborne,* 2 Mich., 519.) But these cases, and the reasons upon which they rest, were examined by this court in *Hubbard* v. *Bell,* 54 Ill., 110, and their authority expressly rejected. In discussing that question this court, on page 122, used the following language: "It is not enough that a stream is capable, during a period, in the aggregate, of from two to four weeks in the year, when it is swoolen by the spring and autumn freshets, of carrying down its rapid course whatever may have been thrown upon its angry waters, to be borne at random over every impediment in the shape of dams or bridges which the hand of man has erected. To call such a stream navigable in any sense is a palpable misapplication of the term." The doctrine of this case has been re-affirmed by this court in *Schulte* v. *Warren, supra,* and on page 119 of the latter case this court approved the following definition of a navigable stream by Lord Hale in his treatise *Dejure maris:* "A stream, to be navigable, must furnish 'a common passage for the king's people,' must be 'of common or public use for the carriage of boats and lighters,' must be capable of bearing up and floating vessels for the transportation of property conducted by the agency of man." And the same definition is also approved in *Joliet and Chicago Railroad Co.* v *Healy,* 94 Ill., 416. In the *Schulte case* it was further said (p. 119): "A stream is navigable, in fact, only where it affords a channel for useful commerce and of practical utility to the public as such. The fact that there is water enough in places for row boats or small launches answering practically the same purpose, or that hunters and fishermen pass over the water with boats ordinarily used for that purpose, does not render the waters navigable."

A stream, to be navigable, must in its ordinary, natural condition furnish a highway over which commerce is or may be carried on in the customary modes in which such commerce is conducted by water. (Gould on Waters, sec. 34, and cases there cited.) Whether the stream in question is navigable is a question of fact, the burden of proving

which rests upon the party asserting it. (*Ligare* v. *Chicago, Madison and Northern Railroad Co.*, 166 Ill., 249.) To maintain this issue appellant with commendable industry has assembled every fact which appears to have even a remote bearing on the question and incorporated the evidence in the record. Research into historical data has been made and the result presented to the court. This class of evidence begins with the account of the first voyage of Marquette and Joliet, in 1673-74, as related by John Gilmary Shea in "Shea's Early Voyages up and down the Mississippi," published in 1700 by Burrow Bros. Excerpts from this publication were introduced, also copies of maps made by Marquette and Joliet showing the principal features of the country explored by them. Section 10 from a chapter from this book, entitled "The first voyage made by Father Marquette toward New Mexico, and how the idea thereof was conceived," reads as follows:

"Return of the Father and of the French.—After a month's navigation, while descending the Mississippi from the 42d to the 34th degree and beyond, and after preaching the gospel as well as I could to the nations that I met, we started on the 17th day of July from the village of the Akensea to retract our steps. We therefore re-ascended the Mississippi, which gives us much trouble in breasting its current. It is true that we leave it at about the 38th degree to enter another river, which greatly shortens our road and takes us with but little effort to the Lake of the Illinois. We have seen nothing like this river that we enter, as regards its fertility of soil, its prairie and woods, its cattle, elk, deer, wild oats, bustards, swans, parroquets, and even beaver. There are many small lakes and rivers. That on which we sailed is wide, deep and still for sixty-five leagues. In the spring and during part of the summer there is only one portage of half a league. We found on it a village of Illinois, Kaskaskia, which consists of seventy-four cabins. They received us very well and obliged me to promise that I would return and instruct them. One of the chiefs of this nation, with his young men, escorted us to the Lake of the Illinois, whence at last, at the end, we reached the bay Des Prantz, from which we had started at the beginning of June."

This account indicates a reasonable probability that Father Marquette went up the Mississippi river, turned into the Illinois, thence up the Illinois to the mouth of the Des-

plaines, and up that river to a point where a portage was made to the south branch of the Chicago river, thence into the Lake of Illinois, (Lake Michigan), and this probability is strengthened by the maps introduced, which show that these rivers, together with the portage between the Desplaines and the Chicago, were known at that time. The boats in which these voyages were made are described in the following passage: "We were not long in preparing all our equipment, although we were about to begin a voyage the duration of which we could not foresee. Indian corn, with some smoked meat, constituted all our provisions. With these we embarked,—Monsieur Jollyet and myself, with five men,—in two bark canoes, fully resolved to do and suffer everything for so glorious an undertaking."

A passage from "Indian Antiquities," by Schoolcraft, is introduced, which recites that in 1783 Jean Baptiste Perrault, a fur trader from Montreal, spent a year in Cahokia and returned by way of Chicago with a canoe and a barge loaded with furs. The passage referred to is as follows: "About the 15th of April the packs from Missouri arrived. Our bourgeois settled his accounts with M. Coteau and received seventy-four packs of furs. His retail store at Cahokia produced 500 Spanish dollars and 400 pounds of tobacco. We left Cahokia on the 4th of May for Mackinac. My directions were to pass by Chicago, having one barge and one canoe, and to await the arrival of M. Marchisseaux at Little Detroit, in Lake Michigan, he having gone by the way of Prairie des Chiens to terminate his business with the Sauks. After fourteen days' detention he arrived, and continuing our route we reached Mackinac the beginning of July, where I found myself at liberty."

A manuscript not very well authenticated was introduced, which shows that Hugh Heward, in May, 1790, made a voyage from Lake Michigan through the Chicago river and over the portage road to the Desplaines, and down the Desplaines and Illinois to some point (probably Kaskaskia) on the Mississippi river. This document records the fact that after passing over the rapids above the village of Mt. Julliette two of his comrades informed Heward that "there was so much danger they would not return with Heward." The character of the boats and cargo is not described, but neither could have been very heavy, since the boats and cargo were carried over the portage from the Chicago river to the Desplaines by Heward and his two com-

rades with the help of five Indians, whose services were paid for with two handfuls of powder.

There are other historical references to the route by way of the Chicago and Desplaines rivers to the Mississippi, but these are the only well authenticated voyages that were made during the first one hundred and fifty years after the discovery of the Desplaines river. The fact that during this long period only an occasional voyage was made under the guidance of a heroic adventurer or a religious zealot, who, in the language of Marquette, "feared no death and regarded no happiness greater than that of losing his life for the glory of Him who made us all," is not sufficient evidence to prove that the Desplaines river was, in fact, regarded as navigable by the great majority of the people who must have been acquainted with it during this period. It rather tends to show that the few who possessed the courage to brave the dangers incident to a voyage over the rocky rapids of the Desplaines were exceptional cases, and that the great body of the people living in the vicinity of this river did not regard the navigation of the river as reasonably safe and therefore made no use of it. There is not in this entire record a well authenticated instance in which a boat engaged in commerce navigated the waters of the Desplaines river. It seems pertinent to inquire, if the Desplaines river is navigable why has it not been navigated? If the Desplaines river was navigable, why did the State of Illinois spend $10,000,000 in the construction of the Illinois and Michigan canal, which parallels the Desplaines river. The conclusion is irresistible that in the opinion of the legislature the Desplaines river was not only not navigable in its natural condition, but that the natural obstructions were such that it was cheaper to construct a navigable canal than to remove the difficulties out of the natural channel. Appellant's answer to the last question above stated is, that the Illinois and Michigan canal was extended beyond the point where it might have intersected the Desplaines river in order to obtain as large a grant of land as possible from the Federal government. This answer discredits the intelligence of Congress and reflects on the honor of the State. We are unwilling to believe that the State would have asked for, or that Congress would have granted, lands to aid in the building of a canal that was not needed. The Chicago river was used as a part of the canal at its northern end, and had it been practicable to

do so, it is reasonable to believe the Desplaines river would have been used at the other end.

A large number of witnesses testified, some from personal observation and others as experts, upon this issue. As might be expected, these witnesses testify to opposite opinions in regard to the navigability of this river. It is not practicable nor desirable to discuss this evidence in detail. Whatever may be thought of the preponderance of it one way or the other, it can have but little weight as against the uncontroverted fact that the river has never been used as a public highway for commerce. During the early part of the history of the Mississippi valley, and before railroad transportation came into general use, all of the navigable rivers in the settled portion of the country were extensively used. The necessities of the early settlers compelled them to use the means of transportation that nature afforded them. Before steamboats were in general use, farm products were floated down the Mississippi river and all of its tributaries in floatboats. The Sangamon, Illinois, Wabash and Ohio rivers were thus extensively used. Had it been possible to do so, it seems but reasonable that the Desplaines river would have been used in the same way by the early settlers, but the evidence of any such use is not found in this record. The evidence shows that as early as 1817 there was a well-beaten wagon road from the mouth of the Desplaines river to Chicago, over which boats and other loads were hauled by oxen and vehicles kept for that purpose by the French settlers at Chicago. The evidence of the existence of this road is found in a report by R. Graham and Joseph Phillips made to Hon. J. C. Calhoun, Secretary of War, and is dated "Kaskaskia, April 4, 1819." The testimony of the early settlers is, that they came in and went out of Chicago by wagon road. In 1836 the New York and Oswego Transportation Line advertised in the *Chicago American* of May 14, 1836, that goods would be transported from New York to St. Louis. One link in the line of transportation was by "wagons from Chicago to the head of navigation on the Illinois river," and in the same paper a passenger line was advertised from Chicago to Peoria, which was by a mail stage leaving Chicago daily for Peoria, making the trip of 170 miles in "from thirty to thirty-five hours by steamboats and stages,—stages from Chicago to Peru and steamboats from Peru to Peoria. Fare, the whole distance, $11, and found on board the

boat. This line passes through Lockport, Juliet, Ottawa and Utica, to Peru." All of the witnesses who testified to the mode of transportation before the opening of the Illinois and Michigan canal, in 1848, testify to the general custom that prevailed along the line of the Desplaines river of hauling grain and other produce by wagon to Chicago, and some of them say that it was not uncommon in those days for wagons to go to Chicago from points as far south as Bloomington.

Appellant has introduced, for the purpose of comparison, descriptions of other rivers which have the same or similar natural obstructions that are found in the Desplaines river, notwithstanding which such other rivers have been held to be navigable. Evidence of this character was introduced in regard to the Mississippi, Fox, Wisconsin, Ohio, Kanawha, Cumberland, Missouri, Gasconade, Allegheny, Tennessee, Sangamon, Columbia and Snake rivers. To review all this evidence would extend this discussion to unreasonable bounds. We are not strongly impressed with the line of reasoning that is based upon this class of evidence. There are no two rivers exactly alike, and it will be found that most, if not all, of the rivers referred to as standards of comparison contain a long strip of navigable water, which is of sufficient length and importance to justify commerce in devising methods to overcome the natural obstructions. This is not true of the Desplaines river. There are no navigable portions of this river of sufficient length to make navigation profitable thereon. After the most careful consideration of this question we are of the opinion that the Desplaines river in its natural condition is not a navigable stream, and that the rights of parties to this suit must be determined upon that basis.

THE VALIDITY OF THE CONTRACTS.—*The flowage contract.*—The third ground upon which appellant rests its right to an injunction is the alleged invalidity of certain contracts entered into between the commissioners of the Illinois and Michigan canal and certain parties who have transferred all their interest in said contracts to appellee. In order to properly understand the questions involved in regard to these contracts it will be necessary to state some facts which we have not heretofore referred to.

At the point where the dam is located the Illinois and Michigan canal parallels the Desplaines river. The two water-courses are separated at this point by an artificial

embankment erected by the State in the construction of the canal. The canal is on the right side of the river, and still to the west of the canal arise steep bluffs, which are known as "Dresden Heights." On the left side of the river the triangle of land between it and the Kankakee is low and flat. The canal is elevated by means of an artificial embankment. This embankment has a trench in the top, carrying the Illinois and Michigan canal. The left-hand side of the embankment slopes toward the Desplaines river. On this side of the canal there is a level space a few feet wide at the crest of the embankment, which is called the tow-path. The sloping embankment of the canal extends up the canal. Appellee's purpose is to construct a dam across the Desplaines river so that the right-hand end thereof will rest against the sloping side of the canal embankment, thus forming a pool of water above the dam which will at its extreme height be twenty-four feet above low-water mark in the Desplaines river at the dam. The pool of water thus formed will extend several miles up the river, one side of which will rest against the canal embankment. At the point where the dam is located the canal embankment is approximately twenty-four feet above the level of the water in the river. The base of the canal at this point is about seventy feet in width, and the left bank next to the river is from twelve to fourteen feet in width at the top. From the base of the canal the ground slopes gradually to the river, which is about seven hundred feet distant. Appellee's intention is to raise the water in ordinary stages to an elevation about seven feet lower than the top of the tow-path bank. About one-half mile up the river from the dam is the southern extremity of a narrow strip of land between the canal bank and the river, which is designated in the record as the "sixteen-acre tract." This sixteen-acre tract is low and marshy, and is bounded on the one side by the Desplaines river and by the canal on the other. It is in section 31, township 34, north, range 9, east of the third principal meridian, in Will county, and is a part of the lands granted by Congress to the State to aid in the building of the canal and still belonged to the State when the flowage contract was made. The effect of constructing this dam will be to flood this sixteen-acre tract.

Appellant contends that the contract executed September 2, 1904, by the canal commissioners to Harold F. Griswold designated in the record as "the flowage contract," is void

and should be so declared by the court. This contract recites, that whereas the said Griswold, party of the second part, claims to be a riparian owner along the Desplaines and Illinois rivers, in Grundy and Will counties, and is as such riparian owner, about to improve the Desplaines river by the construction of a dam and other works across the mouth of said river, with a crest of such height that the pool formed thereby will be on a level with the waters of Lake Joliet, and is about to improve the Illinois river by deepening the channel of said river in section 25, township 34, north, range 8, east; and whereas, the State of Illinois is a riparian owner at different points on the Desplaines and Illinois rivers within the territory covered by this contract, and is the owner of certain described parcels of land under the control of the canal commissioners and which are not connected with a water power upon the Illinois and Michigan canal, which said riparian rights of the State have never produced a revenue, and the land is swampy, partially covered with water, and said lands are so situated that they cannot be made valuable by the State to create water power, and the party of the second part is desirous of obtaining the right to use, overflow and damage said lands, (not, however, in a manner to interfere with navigation on the Illinois and Michigan canal,) so much of the property of the State as may be necessary in the construction of said dam and other works in the improvement of said Desplaines river and in the deepening of the channel of the Illinois river. In consideration of these premises and the sum of $2200, the receipt of which was acknowledged, the parties entered into a contract, the substance of which is as follows:

The said contract purports to give the consent of the commissioners of the Illinois and Michigan canal to the construction of a dam across the mouth of the Desplaines river, with a crest at an elevation not to exceed minus 73.2 Chicago datum, which dam shall not back the water beyond the northern limits of Lake Joliet, and to deepen the channel of the Illinois river at certain points; and gives the rights and authority to Griswold to flow the ninety-foot reserve strip through certain sections of land by the canal bank, and to flow such of the lands in the north fraction of section 31, township 34, as lie south of the ninety-foot strip along the tow-path side of the Illinois and Michigan canal, where the same may be overflowed by reason of

the construction of said dam, together with a right to flow the water up against the tow-path bank of the canal, subject to certain conditions and specifications therein provided, intended to protect and preserve the canal and the tow-path bank thereof. The contract authorizes Griswold to attach one end of the dam to the tow-path bank of the canal, but not so as to interfere in any manner with the use of said tow-path in connection with said canal. The contract also authorizes Griswold to excavate in and remove so much of the Kankakee feeder (an abandoned feeder of the Illinois and Michigan canal) as may be necessary to discharge the waters of the Desplaines river through said feeder in a proper manner, and to remove the old aqueduct piers belonging to said feeder in the Desplaines river. The contract further provides that Griswold shall have the right to turn and avert water from the Desplaines river into the Kankakee river through a certain stream of water called the "Kankakee cut-off," through and over the Kankakee feeder and the ninety-foot strip on each side of the feeder, in section 25, township 33, range 9, and to construct controlling gates on the banks of said feeder for flood protection from the Kankakee river. Clause 6 of said agreement is as follows: It shall be the duty of said party of the second part, subject to the direction of the canal commissioners or other officer or agent, as hereinafter indicated, to raise the tow-path or bank or the Illinois and Michigan canal from its present height not less than two feet, and to any additional height that may be necessary to prevent overflow, and to *perpetually* thereafter maintain the same in good condition. The raising of said tow-path shall extend from the point in said Grundy county where the dam or other structure of said party of the second part intercepts said tow-path bank to lock No. 7, in section 17, township 34, north, range 9, east of the third principal meridian, and when raised, the width of the top of the tow-path bank shall conform to the width of the tow-path as it exists at the present time." By the eighth clause of said contract permission is given to Griswold to use so much of the gravel or other material lying along the canal and belonging thereto as may be necessary to raise the tow-path bank as is provided in the sixth clause, such material, however, to be taken from places indicated or approved by the superintendent of the canal. Permission is given to enter upon the lands and premises of the State for the purpose of con-

structing said dam and raising the tow-path and for making necessary repairs to the same. Griswold covenants to raise certain buildings owned by the State and used in connection with the canal to a level with the tow-path, as provided in paragraph 6 of said contract, and to provide two acres of land to be used by the State as a garden in connection with said buildings. It is provided and stipulated that all of the work to be done under said contract which shall affect the canal property or interest shall be done under the supervision of and to the satisfaction of the canal commissioners or other duly authorized agents, and not otherwise, and that such work, when completed, shall at all times be kept and maintained by said Griswold under a like supervision and approval of the canal commissioners, and that all costs of inspection shall be borne by said Griswold, who is, under the terms of said agreement, to be held responsible for all damages that may be sustained by the State or the canal commissioners, or the persons or property of persons using the Illinois and Michigan canal, or that may be occasioned by the contruction of the works contemplated to be done or in the subsequent repair and maintenance thereof under said contract. Said contract, and all the provisions thereof, are by its terms made obligatory upon the successors and assigns of said Griswold.

The Kankakee feeder is an artificial channel which was constructed upon the right side of the Kankakee river, commencing a few miles above the confluence of the Kankakee and Desplaines rivers and running in a northwesterly direction, almost parallel with the Kankakee river, to a point where the feeder intersects the Desplaines river, a distance of some three-quarters of a mile above the mouth of the Desplaines. The purpose of this feeder was to supply water to the Illinois and Michigan canal prior to the lowering of its summit level, after which the canal was supplied with water from Lake Michigan. The Illinois and Michigan canal being on the opposite side of the Desplaines river from the Kankakee feeder, it was necessary to cross the Desplaines river with this feeder in order to deliver, the water into the canal. The aqueduct and piers referred to in the flowage contract, and which Griswold is given the right to excavate and remove, are the works that were placed in the Desplaines river for the purpose of carrying the water in the Kankakee feeder across the Desplaines river to the canal. As already stated, this feeder was ren-

dered unnecessary after the summit level of the canal was lowered by the city of Chicago, so that the so-called Kankakee feeder has not been used for nearly twenty years prior to the commencement of this suit. It is marked "abandoned" on the map made under the direction of J. W. Woermann, United States assistant engineer. The evidence shows that the Santa Fe and Chicago and Alton railroads cross the Kankakee feeder and the ninety-foot reserve strip on either side thereof, and that the channel is filled up by the railroad embankments at the point where they cross the feeder. The Kankakee cut-off is an artificial channel connecting the Kankakee and Desplaines rivers. It taps the Kankakee river at a point near the section line between sections 5 and 6, township 33, north, range 9, east, and extends north a distance of two miles and intersects the Desplaines river about two miles above its mouth. The Kankakee cut-off crosses the Kankakee feeder near the center of the south line of section 5.

Appellant's contention in reference to this flowage contract is, that it is, in effect, a sale of the interest in the lands affected thereby, and as such it is void under the statute hereinafter referred to, because it was not made at a public offering after giving the statutory notice. It will be observed that this flowage contract is not limited to twenty years or any other specified term. The absence of such limit, and the provision in clause 6 which we have quoted above regarding the agreement of the party of the second part to perpetually maintain the tow-path or the bank of the canal in repair, form the basis for the contention that the contract is, in effect, a sale of the interest in the lands to be flooded. Numerous authorities are cited by appellant to the effect that an agreement for the perpetual flowage is, in effect, a sale of an interest in the land and a right of perpetual possession. Among the cases so holding in this State are *Woodward* v. *Seely*, 11 Ill., 157, and *Wilmington Water Power Co.* v. *Evans*, 166 id., 548. The authorities are numerous in other States to the same effect and the soundness of the proposition cannot be questioned.

The act of March 27, 1874, (Hurd's Stat., 1908, p. 220, *et seq.*), under which all of the contracts in question were made, after providing in section 1 to 7 for the appointment and organization of the board of canal commissioners, by section 8 defines the powers and duties of the said board. Said section 8 reads, in part, as follows:

"Sec. 8. Said commissioners shall have control and management of the Illinois and Michigan canal, including its feeders, basins and appurtenances, and the property thereto belonging, and all locks and dams and other improvements of the navigation of the Illinois and Little Wabash rivers, and shall have authority: * * *

"*Fourth*—To sell and dispose of any machinery, fixtures, stone, debris, material or personal property unnecessary for the proper management, construction, repair or use of said canal, locks, dams, and other improvements.

"*Fifth*—To lease from time to time any of the canal lands or lots owned by the State: *Provided,* no lease shall be for a period exceeding twenty years.

"*Sixth*—To lease from time to time, to the highest bidder therefor, any water power and lands or lots connected therewith. Before any such lease shall be made, at least thirty days' public notice of the intended letting shall be given by publication in some newspaper published in the neighborhood, and such other notice as the commissioners shall deem best. The commissioners shall have power to require that bids be accompanied by security and may reject all bids not satisfactory to them, and re-advertise until they shall receive satisfactory bids. No lease shall be for a period exceeding twenty years, but the commissioners may provide for the extension of any lease from time to time, not exceeding twenty years at any one time, at a rent to be fixed by an appraisal, to be made by three disinterested appraisers to be appointed by the Governor, and such appraisal shall be subject to the approval of the commissioners. All leases of water power and extension thereof shall be subject to the right of the commissioners to resume, without compensation to the lessee, the use of any such water power for the purpose of the canal, and also wholly to abandon or destroy the work by the construction of which the water privilege shall have been created, whenever, in the opinion of the legislature, such work shall cease to be advantageous to the State.

"*Seventh*—To the lease from time to time to the highest and best bidder (after publishing notice in some newspaper published in the county where the ice privilege to be leased may be,) in sections not exceeding one thousand feet, lineal measure, upon such terms, as not to interfere with the proper use and management of the canal, the right to take and harvest ice therefrom, or from any of its feeders, ba-

sins and appurtenances, and to prohibit all persons from taking and harvesting ice therefrom without such lease: *Provided,* no such lease shall be for a longer time than twenty years.

"*Eighth*—To sell and convey, whenever in their judgment the interest of the State will be promoted thereby, any canal lands or lots now owned by the State, and any riparian rights in and along the Desplaines river: *Provided,* they shall not sell any lands or any portion of the ninety-foot strip along the canal which are now utilized in connection with the use of the water power upon the said canal or which will prevent or interfere with the proper use and operation of the said canal as a waterway. But before making any such sale they shall obtain the approval of the Governor thereto, and to the time, place and manner of making the same: *Provided,* that before any such sale shall be made thirty days' previous notice thereof shall be given in some newspaper published in the county where such land, lots or riparian rights are situated. And said land, lots or riparian rights shall be sold at public auction to the highest and best bidder. *Provided,* that any or all such bids may be rejected if, in the judgment of the canal commissioners the interests of the State seem to require it.

"*Ninth*—To execute in due form and deliver any conveyance that may be necessary to comply with the conditions of any bond, contract or agreement heretofore made by those lawfully authorized to sell any of the real estate known as canal lands, where the purchaser shall have complied with the conditions of such bond, contract or agreement, and the commissioners are satisfied that he is justly entitled to such conveyance."

It will be seen that under the second proviso of clause 8 of section 8 of the statute above quoted it is required that before any sale of "canal lands or lots" can be made by the canal commissioners it is necessary that they obtain the approval of the Governor and advertise such sale for thirty days in some newspaper published in the county where such lands, lots or riparian rights are situated, and that such sale can only be made at public auction to the highest and best bidder. If the flowage contract was a sale of canal lands or lots or riparian rights, then, clearly, under this statute such sale would be void, since there was no attempt on the part of the canal commissioners to comply with clause 8 in relation to the sale of canal lands and lots. By careful at-

tention to section 8 and the several clauses thereof it will be found that the powers of the canal commissioners may be divided into two classes, as follows:

(1) Powers which may be exercised without notice, which are: (*a*) All the general powers of the commissioners given by the first sentence in section 8; (*b*) the power to sell and dispose of personal property, as provided in clause 4; (*c*) to lease for a period not exceeding twenty years any of the canal lands and lots owned by the State.

(2) Powers which can only be exercised after public notice and at public auction, which are: (*a*) The power to lease water power and lands and lots connected therewith, as provided in clause 6 of said section 8; (*b*) the power to lease the right to harvest and take ice from the canal, as is provided in clause 7; (*c*) the power to sell and convey canal lands and lots and riparian rights in the Desplaines river, as provided in clause 8.

The commissioners have no power to sell any land or any portion of the ninety-foot strip along the canal which is now utilized in connection with the use of water power, either at public or private sale, with or without notice.

Appellant contends that this flowage contract was a perpetual license to flow certain lands belonging to the State, and is void because a perpetual license is, in effect, a sale of an interest in the land, and regarding the contract as a sale, it cannot be upheld, for the reason that the statute in respect to sales was not complied with. There is no language in the contract showing that the parties to it intended it as a sale of any interest in the lands described therein. To give it the effect of a sale would be obviously against the intention of the parties to the contract.

Appellant contends that the contract is a sale because of the use of the word "perpetually" in connection with the duty of Griswold to keep the tow-path bank in repair. If this contract had by its terms granted the rights and privileges therein mentioned for a term of twenty years it would clearly be within the powers of the commissioners which are enumerated under division "*c*" of class 1, which are granted by the fifth clause of section 8 of the statute, unless the flowage contract should be held to be a lease of "water power and lands and lots connected therewith." If it is possible to do so, such a construction of the contract should be given as makes the contract valid rather than one which destroys it. No time having been stated in the contract it

must be inferred that it was made with reference to the statute, and the contract should be read in the light of the statute under which the commissioners were acting. It is a well established rule that where one attempts to grant a greater estate than he has, the conveyance will be effective to pass what he has although the grant may be inoperative as to the larger estate. Disregarding the word "perpetually," it could not reasonably be contended that the lease extended longer than the term authorized by the statute. It will be noted that the word "perpetually" is not used to define the duration of the rights granted to Griswold, but it occurs in a clause defining the obligations assumed by Griswold. But in our opinion the word "perpetually," as used in this contract, should not be construed as meaning "forever." The question here is, what did the parties mean and how did they understand the term? The word "perpetually" does not always mean "forever." (*De-Florez* v. *Reynolds*, 8 Fed. Rep. 334; *State* v. *Payne*, 31 S. W. Rep. 797.) This court held in *People* v. *Chicago Telephone Co.* 220 Ill. 238, and *People* v. *Central Union Telephone Co.* 232 id. 260, that a grant to a corporation of a franchise without any limitation as to duration will not be held as a grant in perpetuity but will be limited to the life of the corporation to which it was granted; and the same rule was announced by the Supreme Court of the United States in *Blair* v. *City of Chicago*, 201 U. S. 400. In the case last above cited, on page 485, the Supreme Court of the United States said: "We cannot agree that the duration of these permits would be in perpetuity because of the fact that no time was named in them. The extension into Lake View was part of the north side railway system, which by the terms of the grants from the city were limited to twenty-five years, and no longer. There certainly could be no intention, in granting these permits from the supervisors as extensions of the system, to make perpetual grants when the right of user of the main part of the line was expressly limited to twenty-five years, and their inference would be, that in extending this part of the system so as to make a portion of that already granted, such grants were to be for the same term as those already made."

Reading the statute, which authorized the canal commissioners to enter into this contract for a term of twenty years, in connection with the language of the instrument, and construing the word "perpetually" in view of the statute and the context of the contract, we think it means that the rights granted

to Griswold are for twenty years, and that his obligation to maintain the tow-path bank in repair is co-terminous with the rights granted to him.

That this flowage contract was not understood by the parties thereto as conveying a perpetual right to Griswold to flow the property of the State therein described is shown by the fact that on January 6, 1905, the canal commissioners sold and conveyed to Griswold the parcel of land known as the sixteen-acre tract. This sixteen-acre tract is embraced in the flowage contract. If by such flowage contract Griswold obtained the right to flow said sixteen-acre tract in perpetuity, then there would have been no reason for his paying $500 additional for a deed to said tract. This transaction shows that the parties themselves did not regard the flowage contract as a sale of an interest in the land itself. On the same day that the flowage contract was executed, and as a part of the same transaction between the canal commissioners and Griswold, a lease was executed of the ninety-foot reserve strip along the tow-path of the canal, describing said ninety-foot strip in the same way that it is described in the flowage contract, which said lease is for a term of twenty years from said second day of September, 1904. The lease was a general lease, in consideration of $500. It is not stated in said lease what use is to be made of said ninety-foot reserve strip.

It is a familiar rule of construction that where different instruments are executed between the same parties and relating to the same subject matter, all of the instruments should be construed together in determining the real intention of the parties. This rule has often been applied by this court. (*Canterberry v. Miller,* 76 Ill. 355; *Wilson* v. *Roots,* 119 id. 379; *Gardt* v. *Brown,* 113 id. 475.) Applying this rule to the flowage contract and the lease of the ninety-foot strip, which also included the sixteen-acre tract, we have this situation: The canal commissioners leased to Griswold certain portions of the ninety-foot reserve strip, the sixteen-acre tract and certain privileges in regard to the Kankakee feeder for a term of twenty years. At the same time the flowage contract was executed, authorizing Griswold to flow the identical lands, as far as the ninety-foot strip and the sixteen-acre tract are concerned, as are mentioned in the twenty-year lease. Construing both these instruments together and as constituting parts of an entire transaction, there is little room to doubt that the parties intended that the flowage contract

would terminate with the lease upon the same premises. The execution of the lease upon the ninety-foot strip was not an unusual transaction. The evidence shows that for many years the State has derived a very substantial revenue from leases of the ninety-foot strip. The report of the canal commissioners for 1895 and 1896 shows that approximately $10,000 was received as rentals from the ninety-foot reserve strip. There is clear authority under the statute for making such leases, provided the lease shall not extend beyond twenty years, and provided also that where the lease is connected with a water power it can only be made in the manner provided in clause 6 of section 8 of the statute.

Appellant contends that the flowage contract and the lease constitute a water power lease, within the meaning of that term as it is used in clause 6 of section 8 of the statute. Appellant's position is, that since the statute forbids the leasing of "any water power and lands or lots connected therewith," without complying with certain conditions as to advertising and appraising, and since the purpose of Griswold in obtaining these contracts was that he might use the demised premises in connection with the water power which he was intending to develop in the Desplaines river, therefore the lands and lots were connected with a water power and could not be leased without complying with the conditions of the statute, even though the water power in connection with which the premises were to be used did not belong to the State and had no connection whatever with the Illinois and Michigan canal. The fallacy of this contention is obvious. The "water power and lands or lots connected therewith," referred to in the sixth clause of section 8 of the statute, and which the canal commissioners cannot lease except by complying with the conditions imposed by the statute, are clearly the water power in the canal itself and the lands and lots connected therewith, which the State owns and which the canal commissioners are authorized to lease. It cannot be supposed that the legislature intended to give the canal commissioners the right to lease water power which the State did not own and over which it had no control whatever. The language of the sixth clause which authorizes the canal commissioners "to resume, without compensation to the lessee, the use of any such water power for the purpose of the canal, and also wholly to abandon or destroy the work by the construction of which the water privilege shall have been created," clearly shows that the water power which the com-

missioners had the power to lease was a water power which could be abandoned and the use of the water "resumed" whenever, "in the opinion of the legislature, said work shall cease to be advantageous to the State." There can be no doubt, it seems to us, of the meaning of this statute. It means that if a water power on the canal was leased and the drawing off of the water was found to interfere with the use of the canal, the commissioners would have the power to cancel the lease and "resume" the use of the water for canal purposes without paying any compensation or damages to the lessee in consequence of such resumption by the State. As we have sought to show in our discussion of the question relating to the title of the State to the bed of the Desplaines river, appellee owns or controls the lands, upon both sides of the river, at the place where the dam is located. The State owned no portion of the land upon which the dam was located, in the bed of the river or on either side thereof, except the tow-path bank, to which one end of the dam was to be joined. There is therefore no basis for the argument that the flowage contract and the lease were void because they were connected with a water power privilege belonging to the State. No one would seriously contend that the owner of a farm on a river which might be affected by the construction of a dam below it would sell a water power which he did not own, simply by consenting to the flowage of his lands located above the dam. The lands embraced in the flowage contract and the lease were not used in connection with any water power on the canal. Appellee did not obtain its right to build the dam from the State, but this right, as we have seen, existed as an incident to its ownership of the land, on both sides of the river, at the place of its location.

There is a provision in the lease of September 2, 1904, which we are considering as a part of the transaction resulting in the execution of the flowage contract, which provides for a re-leasing at the expiration of the term or a renewal of the lease, provided the lessee is willing to pay as much as anyone else for the premises or an amount to be fixed by appraisement, but which should not, in any event, be less than the amount fixed in this lease. Appellant contends that the covenant for the renewal of the lease for twenty years longer was part and parcel of the leasing contract itself, which, being so construed, made the lease, in effect, a lease for forty years, which renders it void under the statute. The power of the commissioners to provide for the renewal of

leases from time to time, not exceeding twenty years at any one time, at a rental to be fixed by appraisement, is conferred by clause 6 of section 8, and is limited to leases of "water power and lands or lots connected therewith," and has no reference to leases made by private treaty of "canal lands or lots owned by the State," which are authorized to be made under clause 5 of section 8. The lease itself having been made under the fifth clause of section 8, the clause providing for the renewal for another term (provided for in clause 6) was improperly included in the lease. There is no warrant in the statute for inserting such provision in any leases other than those made of "water power and lands or lots connected therewith," under clause 6. Statutes delegating powers to public officers must be strictly construed, and all parties interested must look to the statute for a grant of power. (*Diederich* v. *Rose*, 228 Ill. 610, and cases there cited.) There being no statutory power in the commissioners to enter into the renewal provision in this lease, it necessarily follows that such provision must be held void.

But we are unable to concur in appellant's contention that the invalidity of this clause renders the entire contract void. It does not present a case where a part of an entire consideration for the promise or agreement, or a part of an entire promise, is illegal and void. The lease is a complete contract in all respects, obligating the lessee to pay the entire consideration for the lease for a term of twenty years. The clause relating to the renewal of the lease for twenty years more is an independent and severable covenant, which in no way affects the validity of the lease for a term of twenty years, as therein provided. The rule upon this subject is, that if a contract is made, consisting of two or more covenants, upon a valuable and legal consideration, and one of the covenants is illegal and the other is legal, if the covenants are so distinct that that which is legal may be severed from that which is illegal, so that each covenant may be considered as a distinct contract, the legal covenant can be enforced and that which is illegal disregarded. (Page on Contracts, sec. 509; *Corcoran* v. *Lehigh Coal Co.* 138 Ill. 390.) In our opinion the lease in question falls under the rule above announced, and should be read and enforced as though the renewal clause was not in it.

The deed to the sixteen-acre tract.—On January 6, 1905, the canal commissioners made a quit-claim deed to this sixteen-acre tract to Harold F. Griswold, and appellee has suc-

ceeded to Griswold's title. Appellant contends that the canal trustees had no authority to execute the deed conveying this sixteen-acre tract to Griswold, and that, the deed being void, the title to said tract is still in the State, the protection of which will warrant a court of equity in enjoining the construction of the proposed dam. The charge made in the bill upon which the conclusion of invalidity is predicated is, that the premises conveyed were lands and lots connected with a water power privilege. The canal commissioners not being authorized by the statute to sell and convey water power privileges, or lands and lots connected therewith, it is sought to avoid this sale on that ground. The charge thus made in the bill is apparently abandoned in the briefs, but if it had not been so abandoned we do not regard the position as tenable. The need is a conveyance to a low, marshy piece of land which the State owned, on the shore of the Desplaines river. While, as we have already seen, the conveyance of this strip carried the title to the thread of the stream, still there is not now, and never has been, any water power developed in the river opposite this strip of land. Besides, we have sought to show in our consideration of the flowage contract that the water power which the canal commissioners were prohibited from selling was water power connected with the canal itself. The evidence shows that prior to the sale the canal commissioners applied to the Hon. Richard Yates, then Governor of the State, for his approval of the sale, and after such approval was given the sale was duly advertised in the manner and for the length of time required by the statute and the land sold to Harold T. Griswold for $500, he being the highest and best bidder, and that said consideration was paid by the purchaser and a deed executed in pursuance of the sale. There is no claim that there was any fraud or collusion between the agents of the State and the purchaser at this sale. There is no reason to believe that the consideration was inadequate. This land had been carried by the canal commissioners on their books at an appraisement of $408 and had not been sold, presumably because no one could be found willing to pay the appraised value for it. After holding it more than fifty years it was sold, as above stated, for $500.

The principal reason urged in appellant's brief why this deed should be declared void is, that the sale was not made by the commissioners in person but by a third party who acted at the request of the commissioners. This objection,

it will be seen, is not stated in the bill. But even if this point were properly pleaded and proven, it would amount to nothing more than a mere irregularity, which would not justify a court of equity in declaring the sale void, in the absence of any circumstances showing that the rights of the State had been prejudiced thereby. The power to make the sale is expressly vested by the statute in the canal commissioners. They sold the land in accordance with the formalities required by the statutes and executed a deed to the purchaser. The State received and retained the purchase money and has not offered to return any part of it. The State was, in legal contemplation, the grantor in the deed through its lawfully constituted agents. In *Gunnell* v. *Cockerill*, 79 Ill. 79, and *McHany* v. *Schenk*, 88 id. 357, it was held that a sale made by an attorney of a mortgage, under a power authorizing the mortgagee to sell, was a mere irregularity, which would not affect the rights of innocent third parties who might afterwards acquire the title.

At the time of the sale and conveyance of the sixteen-acre tract to Griswold appellee had no connection either with the land or with Griswold. It was not until November, 1906, that appellee succeeded to Griswold's title to this land. The State took no steps to avoid the sale while the title was in the original purchaser. The records of the county exhibited a clear and unquestionable title in appellee's grantor. The irregularity complained of did not appear of record. Under these circumstances it would be a perversion of equitable principles to permit the State to have this deed declared void because of the irregularity complained of. In our opinion the deed is a valid conveyance of all interest the State then owned in the sixteen-acre tract.

The Kankakee feeder lease.—The Kankakee feeder has already been briefly described. It was constructed about the time the canal was completed. It was originally a navigable canal, forty feet wide at the top and twenty-six feet at the bottom, with a depth of four feet, except at its mouth, where it was five feet deep. Its purpose was to supply the canal, with which it connected, with water brought down from the Kankakee river. A wooden aqueduct resting on stone piers carried the water in the feeder over the Desplaines river to the right bank, near which the feeder flowed, into the Illinois and Michigan canal. This feeder has not been used since the canal was deepened so as to obtain a sufficient water supply from Lake Michigan. The right to remove

what remained of the rock piers in the Desplaines river and to excavate the embankment of the feeder on the sixteen-acre tract north of the river and south of the canal so as to discharge the waters through section 31 in the proper manner was granted by the canal commissioners by the third clause of the flowage contract, and was included in the lease of September 2, 1904, which have already had our consideration. On August 8, 1905, another lease was executed by the canal commissioners to Griswold, purporting to lease to him for twenty years all rights which the State had, under the control of the canal commissioners, to divert the water of the Kankakee river into the Kankakee feeder and to discharge the same into the Desplaines river in said section 31, together with the right to restore the dam across the Kankakee river, and such right as the State had to construct, at each end of the feeder, suitable gates to control the water of the Kankakee river through such feeder, and to enter upon the Kankakee feeder for the purpose of repairing the banks thereof,—all of which rights were granted subject to the rights of the Atchison, Topeka and Santa Fe Railroad Company and the Chicago and Alton Railroad Company, both of which have solid embankments across the feeder and the ninety-foot strip on the side thereof. Said lease gave to Griswold the option of abandoning the premises at any time after five years by giving notice and restoring the feeder to its present condition, if required so to do. Said lease also provided that the canal commissioners might cancel the lease at any time, "whenever, in the judgment of the canal commissioners or other proper officers of the State having charge of canal property, they shall deem the interest of the State required it to re-possess and use the property for State purposes." Said lease was made in consideration of $150 per annum, payable on the tenth day of August, 1905, and on the tenth day of August in each and every year of said term. The lease also contained a renewal clause similar to that already discussed in reference to the lease of September 2, 1904. On November 27, 1907, the legislature adopted the following joint resolution:

"Whereas, the canal commissioners appointed under and by virtue of 'An act to revise the law in relation to the Illinois and Michigan canal and for the improvement of the Illinois and Little Wabash rivers,' approved March 27, 1874, in force July 1, 1874, have at various times heretofore executed leases of water power and water privileges to private individuals

and corporations, under and by virtue of the powers granted to said commissioners by section 8 of the above entitled act, and that among the said leases were certain alleged leases or agreements to Harold T. Griswold, dated September 2, A. D. 1904, purporting to grant and convey certain rights and privileges in and to the waters and water power of the Desplaines and Kankakee rivers; and whereas, the said Harold T. Griswold or his assignees, by virtue of said alleged leases or agreements, are building and constructing certain dams, controlling works, locks and other obstructions in and across said streams, which, in the opinion of this General Assembly, are destructive of the navigation of said streams and to the disadvantage of the State of Illinois; and whereas, the sixth clause of section 3 (8) of said act provides, among other things, as follows: 'All leases of water power and extensions thereof shall be subject to the right of the commissioners to resume, without compensation to the lessee, the use of any such water power for the purposes of the canal, and also wholly to abandon or destroy the work by the construction of which the water privilege shall have been created, whenever, in the opinion of the legislature, such work shall cease to be advantageous to the State'; and whereas, the construction of such dams, controlling works, locks and other obstructions being erected and constructed by the said Harold T. Griswold or his assigns have ceased to be advantageous to the State, and that such water power and water privileges purporting to have been granted in and by virtue of said alleged leases or agreements are necessary for the purpose of the canal; therefore be it

"*Resolved by the House of Representatives, the Senate concurring therein,* That the said canal commissioners are hereby empowered and directed to cancel and annul said alleged leases or agreements and any and all extensions thereof, and to resume all such water power and water privileges therein purported to have been granted to the said Harold T. Griswold by the said canal commissioners on September 2, A. D. 1904, and that said water power and water privileges be restored for the purpose of the canal, and that all such dams, controlling works, locks and other obstructions therein existing for the purpose of creating such water power and water privileges be forthwith abandoned and destroyed by such canal commissioners."

Appellant contends that the adoption of this resolution had the effect of canceling this lease, and assigns two rea-

sons therefor: (1) Because the legislature is the "proper officers of the State in charge of canal property," within the meaning of the language of the lease whereby the right to cancel is reversed; (2) that said contract is a lease of water power, and that the State had the right, under the statute, to resume the use of the water and cancel the lease "whenever, in the opinion of the legislature," it was advantageous to the State to do so. Neither of these contentions can be sustained. The clause in the lease reserving the right to cancel it to "the canal commissioners or other proper officers of the State at such time having charge of canal property," means that the canal commissioners, or such other officers or agents as the State may designate by law to have charge of the canal properties instead of the canal commissioners, shall exercise the right of cancellation. If the State should abolish the board of canal commissioners and create some other agency to have charge of canal property, such other substituted agency could probably exercise the right of cancellation. The right to declare this contract at an end by one party thereto without the consent of the other party should be strictly construed, and so long as the State continues to board of canal commissioners in charge of canal property they are the only officers who can exercise this reserve right. The right under the contract does not arise until in the judgment of the canal commissioners "the interest of the State requires it to re-possess and use such property for State purposes." The discretion or judgment to be exercised, under the terms of the agreement, by the canal commissioners cannot be exercised by other State officials in another department of the State government. The second ground is equally untenable. This lease is not a water power lease, within the meaning of the statute. We have already expressed our views as to the meaning of water power leases, and for the reasons heretofore given appellant's second point cannot be sustained. If this contract was a water power lease, or lands and lots connected therewith, it would be void for other reasons, regardless of the legislature resolution.

There is still another reason why this lease is not affected by the joint resolution. It will be seen that the resolution is directed against certain leases made to Harold T. Griswold on September 2, 1904. Apparently this resolution refers to the flowage contract, the lease of the ninety-foot strip and the pole lease, which were the only contracts

executed between the canal commissioners and Griswold on that day. The Kankakee feeder lease was executed August 8, 1905, and therefore does not come within the purview of the joint resolution. The observations which we have heretofore made in reference to the renewal clause will apply to appellant's objection based on that clause in the lease now under consideration.

Appellant contends further that this lease is void because the Kankakee feeder is an integral part of the canal, and that the commissioners, under no circumstances, have any power to lease the canal itself or any of its parts. Undoubtedly this view is sound as applied to leases which would interfere with the uses of the canal for navigation purposes. All the powers of the canal commissioners should be exercised in such way as to promote the object for which the canal was constructed. All of the powers granted to the canal commissioners have been carefully safeguarded, so that their exercise would promote, and not obstruct or defeat, the primary object the State had in view in lending its generous patronage to this great public enterprise. The Kankakee feeder was originally a necessary part of the canal. It was used not only to supply the canal with necessary water, but the feeder was also used as a navigable canal, through which boats passed back and forth between the Kankakee river and the Illinois and Michigan canal. As already pointed out, about the year 1888 the use of this feeder was discontinued. The dam in the Kankakee river below the head of the canal, which had been used to divert the water of the Kankakee river into the feeder, had been removed and the river restored to its original channel. The wooden aqueduct and the stone piers upon which it stood, through which the waters of the feeder were passed over the Desplaines river, had been allowed to fall into decay. The mouth of the feeder had been filled up under the direction of the canal commissioners. Two railroads had been permitted to construct solid embankments across the feeder, upon which they maintain tracks and operate railroads. Farmers owning lands along the feeder have been allowed to cut down the banks and run fences across the feeder without restriction. There is not the remotest probability that this feeder will ever again be used by the State in connection with the canal.

It appears from the foregoing facts that the validity of the lease of this feeder cannot be questioned on the ground that the exercising of the rights granted will interfere in

any way with the rights of the State or the public in the canal. With an ample supply of water from Lake Michigan it is not within the range of reasonable probability that this channel will ever be needed to feed the canal. Engineer Cooley testified that he could not foresee any state or condition which would render its future use necessary. But even if we may suppose a possibility that this feeder may be again needed by the State, the power to cancel this lease is expressly reserved to the canal commissioners. Again, if such necessity should arise, the things that the lessee is authorized to do by this lease would seem to be in line with the reconstruction of such feeder so that it would become usable. The lessee is authorized to reconstruct the dam in the Kankakee river, to repair the banks af the feeder and to perform other work necessary to cause the water to again pass through the feeder, all of which would be advantageous to the State should it again desire to use this channel. In our opinion there is no legal reason why the canal commissioners may not treat this abandoned feeder, and the lands and lots connected therewith, as other canal property, and lease the same during such time as it is not needed, for any lawful purpose that does not interfere with whatever rights the State may have to resume the use of this feeder for canal purposes. The title of the State to this feeder was not acquired by a grant from the United States government, as was the case with the canal proper, but the right of way for the feeder was obtained, in part, at least, by deeds from private owners of the lands over which it passed. A number of such deeds were introduced at the trial, and all of them contained the following condition: "Provided, however, if the said feeder should not be constructed over and through the said premises, or if, after the construction of the same, it should be by the decision of the board of trustees, their successors or assigns, abandoned and discontinued or the route thereof changed so as not to be continued over the said premises, then and in that case the said lands hereby granted shall revert to the said ..... and assigns." The blank in the last line was filled in with the name of the grantor. The evidence shows that as to a portion of the right of way for the feeder no paper title in the State could be found. It thus appears that a question may arise between the State and those entitled to the reversionary interest under the deeds, whether the State has any title or interest in the right of way of this feeder. This question we do not determine. The

claimants of such reversionary interests are not parties to this suit. Such rights, whatever they may be, will not be affected by the lease or anything that may be done by appellee thereunder. Without determining whether the State has any title or rights in the right of way of this feeder as against persons who may have succeeded to the reversion, and without deciding that the lessee has acquired any rights under the said lease as against such reversioners, our conclusion is that, as between the State on the one hand and the appellee on the other, no legal reason exists why this contract should be declared void.

The pole lease.—The contract designated "the pole lease" was executed September 2, 1904, between the canal commissioners and Griswold, and grants to the lessee the right to erect and maintain a line of poles along and upon the land belonging to the State, part and parcel of the Illinois and Michigan canal lands, to be located between the west line of section 25, township 34, range 8, in Grundy county, to Roby street, in the city of Joliet, in Will county, and between said west line of said section 25 and the western limits of the city of Morris, said line of poles to be placed on the berme side of the canal under the directions of the officers of the canal. Said lease is for a term of twenty years, and is made subject to existing pole leases, and also subject to the right to require a change in the location of the poles at any time when, in the judgment of the superintendent or person in charge of the canal property, such change is necessary. The consideration paid for this lease is $1000. Said poles are to be used by the lessee only in stringing wires to carry electricity generated at the proposed plant. The lessee agrees and covenants to erect and maintain the poles and wires in a good and workmanlike manner and in such way as not to interfere with the business of the canal or the property of others, and to assume all liability for deaths or personal injuries that may result from the use of such poles and wires, and to indemnify and save harmless the canal commissioners for all claims for damages to either person or property. Neither this lease nor the Kankakee feeder lease is of vital importance to the decision of the appellant's right to enjoin the construction of the proposed dam. Whatever view we might entertain in respect to these two contracts, it could not influence the ultimate result of this litigation. There are no reasons urged against the validity of the pole lease which have not been considered in connection with the other contracts, except that

appellant contends that the pole lease gave the lessee control of the tow-path of the canal for a distance of twenty-five miles. This is a misapprehension. The poles are to be placed on the berme side of the canal, which is the opposite side from the tow-path, except "where, in the judgment of said superintendent or officer, the topography of the ground makes it necessary or expedient to have said poles upon the tow-path bank of said canal, the authority is hereby given to said party of the second part to cross said canal and place poles along the said tow-path bank, the necessity or expediency thereof, the place and manner of crossing and placing said poles along said tow-path bank to be subject to the approval and under the direction and supervision of said superintendent or officer. It is distinctly understood, however, that the aforesaid line of poles shall not, in any event, be located or maintained in such place or manner as to interfere with the use or operation of said canal." As thus carefully guarded we are unable to see how it will interfere with the use of the canal or the tow-path. Unless it does so interfere, we see no reason why the contract should be declared void.

Conclusion.—It is seldom a case is presented to a court involving so many questions, both of law and fact, as are presented by this record. We have given the questions involved that careful consideration which their importance seems to demand. In view of the wide range covered by the evidence and the able and exhaustive arguments of counsel we have found it impracticable to discuss all of the questions raised or notice in detail all of the arguments presented, within the reasonable bounds of an opinion. We have, however, considered all of the questions, and discussed such of them in the preceding opinion as appear to be necessary to a proper determination of the legal rights of the parties. After giving due consideration to all that has been said by counsel in support of the several contentions of the State, together with such additional matters as our own investigation has disclosed, we have reached the conclusion that there is no equity in appellant's bill and that the same was properly dismissed by the court below.

The decree is affirmed.

Decree affirmed.

STATE OF ILLINOIS, } ss.
SUPREME COURT. }

I, J. McCan Davis, Clerk of the Supreme Court of the State of Illinois, and keeper of the Records and seal thereof, do hereby certify that the foregoing is a true copy of the opinion of the said Supreme Court in the above entitled cause of record in my office.

This copy is not to operate as a mandate in any event. Mandate will be issued only on request and payment of costs.

In Testimony Whereof, I have set by hand and affixed the seal of the said Supreme Court at Springfield, this 27th day of October, A. D. 1909.

J. McCAN DAVIS,
(Seal.) *Clerk of the Supreme Court.*

NOTE:—The foregoing opinion appears in 241 Illinois, pages 290-365.

995 GEORGE W. RAYMOND, witness for complainant, testified as follows:

Direct Examination.

I will be 70 years old the 20th day of next May. I live in Morris, Grundy county, Illinois. Have lived there nine years. Before that I lived in the town of Norman, Grundy county, in section 32, range 6. I have lived in Grundy county about 40 years. I was born in Big Grove township, at that time a part of La Salle county, Illinois. In 1855, my father bought a
996 half section of land where my farm now is. This farm, which I now own, is the northwest 200 acres of section 32, range 6, and is about a mile directly south of the south bank of the Illinois River. I remember the very high water in the Illinois River in 1857. As to how high the water was at that time, would say that I was a good swimmer. My brother sent me to Morris to get some milling done. On the south bank, to approach the ferry, I put what grain I had on some boards on top of the wagon box. I managed to get to the little ridge along next to the south bank and there got onto a ferry, and when I got there I crossed over and got my milling done, and bought my groceries, and by that time the river had risen so that it was impassable, so I took down the north bank down to about what they called at that time McMillan farm. That was nearly, not quite, opposite our farm and there I put my horses up and stowed away my stuff, and I got one of the boys to row me over the river and walked afoot over to our home.
Our team remained there about two weeks. Then I went
997 over and got an old scow flat boat; put my wagon and my team on and my commodities and I started. I landed about two miles below on the opposite bank, by tying up before the boat got to shore and got near enough so that I got my team and wagon off. As to whether there was any local bench mark or high water mark preserved locating the height of that high water of 1857, would say that there was a tree between my house and the bottom road, a hackberry tree where just at the roots there was a high water mark. That had already been taken out and obliterated. But I could approach it within a reasonable distance. The high water of 1857 was six feet higher, I should say, than it was last year (1907). I am acquainted with the local reputation among the Indians who were still living in that vicinity at the time of the high

water of 1857. The Pottowatamie chief Shabbona lived and died about a mile and a half from the farm I own now.
998 I knew him very well. I conversed with him about the local reputation of the state of water in the river. I compared with him the local reputation of the former waters known to him with that of 1857. When I went over to McMillan after my horses, wagons, etc., I told Shabbona by motions and talk that I wanted to get crossed over. He called a couple of squaws and they motioned to me and we went up the river a ways and they had what we call a canoe; and I seated myself nicely down in the bottom and they paddled me across, and I gave them a quarter of a dollar. I used to be very friendly with the old chief and I gave him a part of a sack of that flour that I got over on the scow and I asked him in regard to the water at that time and he made motion and he showed me—he put his cane up this way (indicating) "So; there, so, up." In the Indian way. He would understand very well what you said to him and he possessed that peculiar Indian way, a good deal of sign language as well as words. The height that he indicated was four feet higher, I should say, than the level of 1857. As to whether he ever talked to me about the local
999 reputation of the use of the stream in the early days by the settlers and explorers, would say that he told me one time, motioned that he was a small boy about three feet high, that "Me go this way, so, around Seneca." Seneca is in a low swale north of the river; is probably twenty feet above the natural flow of the Illinois River. One time he said they could go from here around so with canoes; Indians; when he was a small boy. At that time I presume likely Shabbona was 80 years of age. Shabbona used to stay at my house quite often and I asked him at that time when he was there in regard to getting my team over if the white men years ago used to go up and down. He said, "White men go so, so."

Q. Pointed both ways?

A. "So." He said, "Didn't go up stream, but they went this way (indicating)."

Q. Down stream?

A. Down stream.

1000 *Cross-examination.*

My farm is located southwest of Morris, between Morris and Seneca near the Illinois River. It is approximately 13

miles distant from Morris. It is 8 miles further up to Au Sable. As to whether my farm is located in the vicinity of the south bank of the Illinois River some 23 miles below the mouth of the Desplaines River, would say that if your statements are correct that is so. As to whether in my conversation with this old Indian I gathered from his statements to me that the white men never went north of my farm up the river, would say that they never went up stream.

Q. Never went up stream, but went from that point down the Illinois and into the Mississippi?

A. Yes. Well, he didn't say that—

1001 Mr. Starr: He didn't say from that point.

Q. Well, went down the stream?

A. Went down the stream.

Q. But not up stream?

A. No sir. Some two weeks after the flood of 1857, I went after my horses and got them on this flatboat, but before I could get across I had gone down the stream about two miles. The current was pretty swift. It was impossible at that time to row a boat up stream. I took an angling course to get across, and I went across just as quick as I could, that is, took the shortest distance. I have had some experience

1002 in navigation and boating on the Mississippi, the Arkansas and the White River. This experience covered about two years time. As to whether or not the Illinois River from the point where my farm is some 23 miles below the mouth of the Desplaines River is capable of carrying the commerce of this territory adjacent to the Illinois River in the ordinary way in which commerce is carried on (to which objection was made on the ground that it was not proper cross-examination, no foundation laid and incompetent, irrelevant and immaterial), I would say that I cannot state the condition of the Illinois River from the mouth of the Au Sable up towards the Desplaines. I never went over that ground. From that point down to where my farm is located or even below as

1003 a practical mode of transportation it is not so. I refer to both present and past conditions. From the signs that Shabbona communicated to me he gave me to understand that he had been familiar with the river since he was a boy of five or six years. He belonged to the tribe of Pottawatamie Indians. In 1857 I was 20 years old.

Q. Have you ever heard—do you know anything about the Desplaines River and its adaptability for carrying commerce?

A. Personally I do not.

1253 JOHN McCOWAN, a witness for the defendant, testified as follows:

Direct Examination by Mr. Munroe.

Q. Your name is William McCowan?

A. No, John. I have been called as a witness in this case before. I testified in my former examination, I believe, that I live near the wide water, in the Township of Channahon. I went to Channahon Township the 28th day of May, 1835.

1254 I knew all the neighbors in the township shortly after I came there,—all that were anywhere near Channahon. Of course, I heard of the others: The Linebargers; there was the Trite, and the Eibses, Jessups, Morehouse, Schermerhorn, Knapp and the two Tryon brothers. That is all that I knew,—there might have been some others. I knew John and Edwin Jessup. Mr. Prior was a cousin of John and Edwin; I was 9 and he was 18, and I think the Jessup brothers, that is, the two older brothers were a year or two older

1255 than he was. I ain't certain about their ages. I knew them well and intimately. Ofter went to their house and often met them. The Jessups lived in a log house when I came to Channahon in 1835. I could not state just how long they lived in that log house, as it was quite a number of years.

My father built the first sawed lumber house in the Township of Channahon; it was a small house, but it was a house; and Judge William D. Beck,—his name is mentioned in "Woodruff's History of Will County,"—those two buildings were the first sawed lumber houses in the Township of Channahon. The lumber that went into those houses came from Jack's mill, about four miles north of the Village of Channahon, on the DuPage River, and on the east bank of it.

1256 These houses were build in 1835, and that mill was in operation at that time. The Jessups had a log house, and in the rural communities they wasn't in no great hurry about getting lumber houses, and I cannot say just exactly when they build their house. This old man Jessup's house,—Isaac Jessup's house,—him and his two sons, or four sons rather, lived there together in this log house; and how long they lived in the log house, before the farm house, or board house, or whatever you have a mind to call it, I don't know; that is, I don't remember.

The lumber that the Jessup's built their house of, part of it

came from Chicago. That was a soft wood lumber they hewed the sills out. The soft wood lumber came from Chicago and the hardwood lumber, the same as the joists and studding, in the old house,—the Isaac Jessup house,—the first house east of what is called the Lewis house,—came from Jack's mill.

1257 I know the Jessup's didn't own any boat; I could not say about a skiff, because most everybody had a skiff, or Indian canoe hewed out of a log, but they didn't have any kind of a boat that you could carry lumber on. They didn't ever carry any lumber for any of the mills in the vicinity of Channahon that I ever heard of.

Q. Mr. W. W. Stevens has testified that Mr. Jessup told him in 1855 that they owned a boat and made frequent trips to saw mills in Wilmington in order to get lumber to build houses for the early settlers in Channahon. Do you know whether that is true or not?

A. I know they never had a boat to do that kind of work. I could not say whether Channahon was settled before Wilmington was settled. There might have been a little hamlet there. Of course, I didn't know anything about Wilmington until about 1840. There was not any house built there before the canal with lumber from Wilmington. I know every house that was built there within a radius of four or five miles

1258 of me, and the stuff came from Jack's mill and from Chicago. When they brought it from Chicago, they brought it sometimes with ox-teams, and some had horses and then they brought it with horse-teams.

Q. Mr. W. W. Stevens has also testified that a man by the name of Fish had a saloon near Au Sable, and got his whisky down from Chicago by boats.

A. I never saw anything at all at Au Sable until Mr. McNillis built a distillery there.

That was about the time of the opening of the Illinois

1259 and Michigan Canal. There was whiskey and such things brought down from Chicago to Joliet. I brought down two barrels at one time with a yoke of oxen. It must have been about 1844, because that was the year we bought our horse team; and teams were going back and forth between Joliet and Chicago,—not every day because they only went when the farmers wanted to carry their produce, and then the Joliet merchants got them to bring stuff down. There was no store in Channahon in them days. You had to go to Joliet

for your provisions. Joliet was the staple town. No,
1260 I don't think people went to Wilmington to get supplies, because Joliet was closer.

There was another saw-mill on the DuPage River besides Jack's saw-mill at an early day, but not so early as Jack's. That was located about a mile,—no, about three-quarters of a mile down the DuPage, from the road from where the broken bridge is.

I testified that I took my crop of corn in the year '35 to a grist mill at Treat's Island to be milled. I cannot say when the saw-mill was built at Treat's Island; that ain't fixed in my mind; I know it was quite a while after that,—that is after '35.

Cross-Examination.

I came to that community in 1835. I was 8½ years old. I was not here before that. I came from York State out
1261 there. The Jessup family which I mentioned lived in a log house. I did not see the log house built because it was built previous to 1835. They lived in it to 1834. Jessup and Morehouses came here in '34, and old Judge Peck came from Point Hook Landing. The Jessups and Morehouses came from Shodick's Landing. It was common talk all through the community. The community was not very large. There was the Shermerhorn, Morehouse and Jessup families came from Shodick's Landing. Quite a number of log houses were built after I came to that point. I saw some of them built and saw them after they were built. The logs came from the woods. There were plenty of woods all around there. They went to the timber and cut them down and hauled them where they wanted them and rolled them up. These logs were not transported on the water, nor transported on wagons part of the way and water part of the way. They were cut right in the timber and transported where they were wanted.
1262 Some of them were transported by wagons and some of them by log chains with cattle on,—two or three yokes, depending on the length of the log. I've seen three yoke of cattle on a log. A great many of the logs were chopped right in the timber that surrounded the mill. There was two or three hundred acres of good timber land, but they did not happen to have much walnut in that grove,—black walnut; it was principally oak and bass wood. Loge were brought from a distance, from our place, which was just about two miles above the village of Channahon.

None of these logs were transported by being floated on the water. I stated that pine lumber came from Chicago. I said pine lumber; basswood is a soft wood, but that did not come from Chicago. Pine lumber came from Chicago because there was no pine in this country, nor even in Chicago, that was shipped down.

1263 The 24th day of May, 1835, there was a raft of pine logs brought down along the lake shore, a mile and a quarter long, and they had to cut it in pieces before they could get it up in the Chicago River. I did not stop to see what became of it, because I left there the 26th. I presume it was hauled out on the beach. There were no wharves and no docks; but I suppose they had teams that hauled them out when they got them loose and they hewed them up. I didn't state this from positive knowledge, but I seen the raft come there and I seen them commence to pull them out with teams, but I didn't see them manufacture it.

I am familiar with the Desplaines River from points nearby, July, 1835, to the present day. I didn't ever see any rafts or logs either in large quantities or small quantities floated down the river; never saw any such a thing, because there was no necessity for it. There was heavy timber, and they even got saw-mills, steam saw-mills, to saw logs up,—that is, in the later days, and there was no necessity for timber to be floated on the river, because the mills were built near the timber.

1264 I have seen skiffs on the Desplaines River which carried equipments. These skiffs would probably carry two men and probably carry four or five hundred weight. I have never seen any boats on the river larger than those skiffs. It would be impossible for them to go a great ways from 1835 until the drainage floated the water down here from Chicago and from Lake Michigan. I didn't ever see any boats larger than those skiffs go short distances.

5319 CHARLES A. MUNROE, a witness for defendant, testified as follows:

Direct Examination.

My name is Charles A. Munroe. I am the Mr. Munroe, who has been referred to in the testimony here quite frequently. I am an attorney by profession. I have not practiced my profession for about two or three years. I first became identified with this project to build a dam on the Desplaines River, somewhere in the neighborhood of the Illinois in the spring of 1904. I had not any connection at that time of any nature with the Economy Light & Power Company. The first time that I had any negotiations with the Economy Light & Power Company in reference to this project was in May, the latter part of April, or the first week in April, 1906.

Q. In the meantime you had acquired flowage rights, or ownership to a large proportion of this property as shown on Woermann's Exhibit 1, June 15, 1908, and Woermann Exhibit 2, June 15, 1908, had you not?

5320 Objected to as incompetent, irrelevant and immaterial and not the best evidence; overruled.

A. I had acquired title to all of the property, contracts for title to all of the property shown in colors on those two exhibits, and had made all financial arrangements for constructing the power house and dam at the mouth of the Desplaines River.

COUNSEL FOR COMPLAINANT. I move that the latter part of the answer be stricken out.

Sustained.

COUNSEL FOR DEFENDANT. I will ask another question.

Q. Had you made any arrangements with reference to constructing this dam before you had any negotiations with the Economy Light & Power Company?

A. Yes, sir.

Q. Please state what they are.

Objected to as incompetent, irrelevant and immaterial; overruled.

A. Yes, sir; and the arrangements were completed for constructing, in the spring of 1906, a power plant at the mouth of the Desplaines River, at substantially the same location, and of the same character as the power house the Economy

Light & Power Company is now attempting to construct.

5321 Q. How many acres of land have you acquired?

COUNSEL FOR COMPLAINANT. Objected to as incompetent, irrelevant and immaterial and as not the best evidence.

A. About seventeen hundred.

Q. When did your negotiations with the Economy Light & Power Company ripen into a definite contract?

COUNSEL FOR COMPLAINANT. I suppose it is not necessary to repeat the objection.

The COURT. No; your objection may go to the whole line.

A. (Continued.) The 31st of July, 1906, the arrangements were made, subject to examination of title and were consummated by the passing of the deeds on the 30th day of November, 1906, and contemporaneous with the passing of the

5322 deeds, the trust deeds were executed bearing date December 1, 1906, to the Royal Trust Company, trustees, to secure an issue of three millions of bonds.

COUNSEL FOR DEFENDANT. How many of those bonds have been sold, if any?

Objected to; overruled.

A. Two millions of the bonds have been sold.

Q. And the trust deed executed to the Economy Light & Power Company?

A. Yes, sir.

Q. Does the trust deed convey these properties?

A. It does.

Q. Are those bonds now outstanding?

A. They are.

COUNSEL FOR COMPLAINANT. I take it that it is understood by the court and by counsel that the objections I have made, that the evidence is incompetent, irrelevant and immaterial, and not the best evidence, is reserved to each of these questions, and I make a motion to strike out all of the testimony relative to the title to the property, and the issuing of the bonds on the same grounds.

The COURT. The contents of the trust deed is not the best evidence.

5323 Counsel for defendant offered the deed of trust from the Economy Light & Power Company to the Royal Trust Company.

Objected to as incompetent, irrelevant and immaterial; overruled.

(Said deed of trust from the Economy Light & Power Com-

pany to the Royal Trust Company was received in evidence.) (Trans., p. 6302.)

5324 *Cross-Examination.*

I did not attend the taking of the depositions on the part of the State at Joliet in the early part of this year, as the attorney for the defendant. I was there at every opportunity that it was possible for me to be there. I am not an attorney for the defendant. I am an interested party in the defendant company. I am not an attorney for it. On two or three occasions, an attorney for the defendant was not there other than myself. Mr. Porter was unable to attend the meeting which had been arranged to take the depositions, and he telephoned to me and asked me if I would attend to it, and I did, to the best of my ability. I was the only attorney that was there on the part of the defendant acting for Mr. Porter. I am the same Mr. Munroe who is shown to have been in attendance by the record in the taking of the depositions. I will not say that when the record shows that I made objec-
5325 tions, and asked questions, and made statements, there was no other attorney for the defendant present. I think I injected remarks once in awhile that appear in the record where I didn't have any business to do so. Well, leaving out the word "remarks," when the record shows that "Mr. Munroe" was asking questions, I was that Mr. Munroe, and generally speaking, I did that only when there was no other lawyer for the defendant there.

Re-direct Examination.

I am and was at the time of the taking of the depositions, the General Manager and Treasurer of the company. I have not been paid any fee, or been retained and do not expect any fee as attorney in this case. I learned when I was an attorney, that a party in interest might conduct his own suit
5326 if he wanted to, but I learned it was bad policy to attempt it. My connection with the Economy Light & Power Company began when the manager of the Economy Light & Power Company died on the 12th of January, 1907, and on the 16th of that month, I was appointed to his position. It has been testified here that I have paid certain moneys to the contractor, and have made certain contracts with him; in

addition to that, the Economy Company has paid out moneys on account of the construction of this work, about $135,000. That is for machinery and wheels. In April of 1907, we purchased $142,000 worth of hydraulic machinery for this plant, upon which we paid $55,000, and engineers' expenses and payments for work done by the contractor, and to the contractor.

Q. What is your approximate estimate of the entire cost of the work?

5327 COUNSEL FOR COMPLAINANT. I suppose it is understood that my objections to this as incompetent, irrelevant and immaterial, stand to all of this supplemental evidence.

The COURT. Yes.

A. Nine hundred thousand dollars; that is exclusive of the land.

Abstract of trust deed offered at trans. p. 5323 of the record in the state case, as it appears in abstract of state case at page 1854a.

Economy Light & Power Company to Royal Trust Company.	Trust Deed dated December 1, 1906. Recorded..... Consideration, $1.00.

Property conveyed:—twenty-two (22) city lots in North Joliet,

the Dam No. 1 lease;

the lands situated in various sections in Township thirty-four (34) north, Range nine (9), Will County;

the full and free use, benefit and enjoyment of a certain stream of water called the Des Plaines River, flowing through certain lands, as it may be necessary for said Economy Light & Power Company, its successors and assigns to take, flow, injure or damage, in order to utilize the fall in said river;

and also certain other lands situated in Township thirty-five (35) north, Range ten (10), Will County;

the contract between Harold F. Griswold and the conservator of the Estate of Harvey Glidden.

the Griswold lease from the Canal Commissioners, dated September 2, 1904;

the agreement between Harold F. Griswold and Peter Conroy;

the pole line contract of the Canal Commissioners dated September 2, 1904;

the Kankakee Feeder lease between Canal Commissioners and Charles A. Munroe, dated January 5, 1905,

and all other contracts assigned by Harold F. Griswold and Charles A. Munroe to the Economy Light & Power Company.

Secures an issue of 3,000 First Mortgage 5 per cent. Bonds of $1,000 each of said Economy Light & Power Company aggregating in amount $3,000,000, said bonds being dated December 1, 1906, and payable December 1, 1956.

Article 6. 790 bonds to be issued to retire former bonds and bonds No. 791 to 2,000, inclusive, to be delivered to Trustee for certification and proceeds to be used to pay $138,000 of floating debt and $274,000 to be used for purchase of lands, flowage rights and contract rights and other property, and the remainder of the proceeds of said 1,210 bonds so far as necessary to be used to pay the cost of constructing dam, water power works, etc., and balance to be held for future sale.

2 Pleas in the District Court of the United States for the Northern District of Illinois, Eastern Division, in Chancery sitting, at the United States Court room, in the City of Chicago, in said District and Division, before the Honorable Kenesaw M. Landis, District Judge of the United States for the Northern District of Illinois, on Friday, the twenty-fifth day of May, being one of the days of the May Term of said Court, begun Monday, the seventh day thereof, in the year of our Lord one thousand nine hundred and seventeen, and of the Independence of the United States of America, the one hundred and forty-first year. Placita.

Present:

Hon. Kenesaw W. Landis, District Judge, Presiding.
John J. Bradley, United States Marshal for said District and
T. C. MacMillan, Clerk of said Court.

m-
iled
1909.

3 IN THE CIRCUIT COURT OF THE UNITED STATES,

Northern District of Illinois,

Eastern Division.

United States of America,
vs.
Economy Light and Power Company. } 29776.

Be It Remembered, That heretofore to-wit: on the fourteenth day of December, 1909, came the United States of America, by the United States Attorney for the Northern District of Illinois, acting under the direction of the Attorney General of the United States, and filed in the clerk's office of said Court, a certain Bill of Complaint in words and figures following to-wit:

4 IN THE CIRCUIT COURT OF THE UNITED STATES,

For the Eastern Division of the

Northern Judicial District of Illinois.

United States of America
vs.
Economy Light and Power Company. } In Chancery. No. 29776

To the Judges of the Circuit Court of the United States for the Northern District of Illinois, In Chancery Sitting:

Now Comes the United States of America, by Edwin W. Sims, the United States Attorney for the Northern District of Illinois, acting under the direction of the Attorney General of the United States, and brings this, its bill, against the Economy Light and Power Company, defendant, and thereupon complaining says:

That the defendant, the Economy Light and Power Company, is a corporation duly organized under the laws of the State of Illinois, and that its office and principal place of business are in Chicago, in the County of Cook and State of Illinois;

That said defendant, the Economy Light and Power Company, without the consent of congress and without authority of the legislature of Illinois, and without the approval by the

Chief of Engineers and by the Secretary of War of the location and plans therefor has commenced the construction of a dam in the Desplaines river at a point in said river in Grundy County in the State of Illinois, and within said Northern District of Illinois, and has already constructed a part of said dam; and that the portion of said Desplaines river in which the construction of said dam has been commenced is a navigable water of the United States; Bill of plaint. Dec. 1

That said Desplaines river has its source in the State of Wisconsin, and flows in a southerly direction into the State of Illinois and through the northern portion of said state into said Grundy County in said state, where it unites with the Kankakee river and forms the Illinois river, which last named river flows through a portion of said State of Illinois into the Mississippi river;

That said defendant claims to be the riparian owner of the land along both sides of said Desplaines river at the point where the construction of said dam has been commenced; that its title to said land is based upon mesne conveyances from one Charles E. Boyer; that said Boyer obtained title to said land through deed from the Board of Trustees of the Illinois and Michigan canal, dated October 22, 1860, and conveying to said Boyer certain lands therein described as follows:

"The South fraction of the Northwest quarter (NW¼), and the North fraction of the Southeast quarter (SE¼), and the North fraction of the Northwest quarter (NW¼), and the South fraction of the Southeast quarter (SE¼), of said Section twenty-five (25) in Township thirty-four (34) North, of Range eight (8), East of the Third Principal Meridian, excepting and reserving so much of said tract as is occupied by the canal and its waters, and a strip ninety (90) feet wide on either side of said canal, containing one hundred and ninety-six and sixty-two hundredths (196.62) acres, more or less, said tract being a portion of the land granted by the United States, by Act of March 21, 1827, and the 28th day of August, 1854, to the State of Illinois, to aid said State in opening a canal to connect the waters of the Illinois river with those of Lake Michigan, and by said State granted to the said Board of Trustees of the Illinois and Michigan canal for the purposes set forth in said Act of said State of February 21, 1843:"

that the portion of said Desplaines river in which the construction of said dam has been commenced by said defendant flows through the lands described in said deed to said Boyer;

That by act of congress of March 30, 1822, entitled "An Act

to authorize the State of Illinois to open a canal through the public lands, to connect the Illinois River with Lake Mich-
6 igan," it was provided that the State of Illinois be authorized to survey and mark, through the public lands of the United States the route of the canal connecting the Illinois river with the southern bend of Lake Michigan; and that ninety feet of land on each side of said canal should be forever reserved from any sale to be made by the United States, except in the cases thereinafter provided for, and the use thereof forever vested in the said state for a canal and for no other purpose whatsoever; on condition, however, that if the said state did not survey and direct by law said canal to be opened, and return a complete map thereof to the Treasury Department, within three years from and after the passage of said act; or, if said canal be not completed, suitable for navigation, within twelve years thereafter; or, if said ground should ever cease to be occupied by, and used for, a canal suitable for navigation, the reservation and grant thereby made should be void and of none effect; that it was further provided by said act that said canal when completed, should be and forever remain, a public highway for the use of the Government of the United States, free from any toll or other charge whatever, for any property of the United States or person in their service passing through the same;

That by act of congress of March 2, 1827, entitled, "An Act to grant a quantity of land to the State of Illinois, for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of Lake Michigan," it was provided that there be granted to the State of Illinois, for the purpose of aiding the said state in opening a canal to unite the waters of the Illinois river with those of Lake Michigan, a quantity of land equal to one-half of five sections in width, on each side of the said canal, and reserving each alternate section to the United States, to be selected by the Commissioner of the Land Office, under the direction of the President of the United States, from one end of the said canal to the other; and that said land be subject to the disposal of the legislature of the said state for the purpose aforesaid, and no other; and that said canal when completed should be and forever remain a public highway for the use of the Government of the United States, free from any toll or other charge whatever, for any property of the United States or persons in their service passing through the same; and that said canal should be commenced within five years and completed in
7 twenty years, or the state should be bound to pay to the

United States the amount of any lands previously sold, and that the title to purchasers under the state should be valid; that it was further provided by said act that as soon as the route of the said canal should be located and agreed on by the said state it should be the duty of the governor thereof, or such other person or persons as might have been, or should thereafter be, authorized to superintend the construction of said canal, to examine and ascertain the particular section to which said state would be entitled under the provisions of said act, and to report the same to the Secretary of the Treasury of the United States; that said act further provided that the said state, under the authoriy of the legislature thereof, after the selection should have been so made, should have power to sell and convey the whole, or any part of said land, and to give a title in fee simple therefor, to whomsoever should purchase the whole or any part thereof; Bill of plaintiff Dec.

That prior to the passage of said acts of congress above mentioned, to wit, during the year 1821, the United States made a survey of public lands along and adjacent to said Desplaines river, including the portion thereof in which the construction of said above mentioned dam has been commenced, and caused said Desplaines river to be meandered, and fixed and determined upon its said surveys of public lands the meander lines of said river, which said surveys showing said meander lines were made, and have been continuously since the time of said surveys, a part of the public records of said United States relating to the public lands; that pursuant to said acts of congress the route of said canal was laid out by said State of Illinois, and thereafter, to wit, in December, 1829, a map showing said route was filed with the Treasury Department of said United States; that the construction of said Illinois and Michigan canal was commenced in the year 1837, and was completed in the year 1848; that by act of February 26, 1839, entitled "An Act to amend the several laws in relation to the Illinois and Michigan canal," said State of Illinois made provision for the sale and disposal of said lands granted by the United States by said act of March 2, 1827, and therein provided as follows:

"Lands situated upon streams which have been meandered by the surveys of public lands by the United States shall be considered as bounded by the lines of those surveys, and not by the stream;"

8 that in and by said act of 1839 said legislature of the State of Illinois declared it to be its understanding that said grant of March 2, 1827, did not include the land and the river

bed within said meander lines, and that said State of Illinois did not accept any grant of the land and river bed within said meander lines to be disposed of for the purpose specified in said act of March 2, 1827; that there never was any acceptance by said State of Illinois of the land and river bed within said meander lines as a part of said grant under said act of March 2, 1827, and that upon the contrary, upon the surveys of said State of Illinois showing the land accepted by it under said grant of March 2, 1827, for disposal by the state pursuant to said act, it was indicated that the land and river bed within said meander lines, including that portion of the bed of the Desplaines river where said defendant has commenced the construction of the above mentioned dam, was not included in the lands accepted by said State of Illinois to be disposed of pursuant to the terms of said act of March 2, 1827;

That by act of February 21, 1843, entitled "An Act to provide for the completion of the Illinois and Michigan canal, and for payment of the canal debt," the legislature of the State of Illinois created a board known by the style and description of the "Board of Trustees of the Illinois and Michigan canal," and for the purpose of raising a fund for the completion of said Illinois and Michigan canal authorized the governor of said state to negotiate a loan, solely on the credit and pledge of the said canal, its tolls, revenues, and lands, to be granted to said board of trustees; and for the purpose of placing in the hands of said trustees full and ample security for the payment of said loan authorized by said act and the interest thereon, as well as for securing a preference in the payment of such of the canal bonds and other evidence of indebtedness issued by said state for the purpose of aiding in the construction of said Illinois and Michigan canal as might be owned by the subscribers to the said loan the said State of Illinois by said act of February 21, 1843, assumed to grant to said board of trustees of the Illinois and Michigan canal the bed of said Illinois and Michigan canal, and the appurtenances thereto, and all the property, right, title and interest of the state, of, in and to the said canal, with all the hereditaments and appurtenances thereunto belonging, or in any wise appertaining, and also all the remaining lands and lots
9 belonging to the said canal fund, or which thereafter might be given, granted, or donated by the general government to the state, to aid in the construction of the said canal; that said act further authorized said board of trustees to take possession of said canal, lands, and property, and also pro-

vided that none of the lots, lands or water powers so granted to the said trustees should be sold until three months after the completion of said canal; that, pursuant to their authority under said act of February 21, 1843, said board of trustees of the Illinois and Michigan canal, in the year 1846, caused a survey of said lands to be made showing the lands granted by the United States and accepted by the State of Illinois, to be disposed of by said state for the purpose specified in said act of March 2, 1827; that upon said survey so made said meander lines of said Desplaines river as shown by said government survey above mentioned were designated as the boundaries of the lands granted by the United States and accepted by the State of Illinois for disposal under the terms of said act of congress of March 2, 1827; that the sale of said lands by the State of Illinois to said Boyer above mentioned was made in accordance with said survey by said board of trustees of the Illinois and Michigan canal, and that upon said survey the portion of said Desplaines river in which said defendant has commenced the construction of said dam is designated as within said meander lines and is not included among the lands granted by the United States and accepted by the State of Illinois for disposal pursuant to the terms of said act of congress of March 2, 1827. Complainant further charges that said survey of said canal commissioners was made under authority of said State of Illinois, and that the boundaries as shown thereon with respect to the lands granted by the United States and accepted by the State of Illinois for disposal in accordance with the terms of said act of March 2, 1827, were ratified, accepted and acted upon by said State of Illinois in all of its transactions relating to said lands; that under said grant of March 2, 1827, said State of Illinois did not acquire any title to or interest in that portion of the bed of the Desplaines river where said defendant has commenced the construction of said above mentioned dam, and that said Boyer by his said deed from the State of Illinois did not acquire any title to or interest in that part of the bed of said river, and that said defendant has no title to or interest in that portion of the bed of said Desplaines river where it has commenced the construction of said dam above mentioned, and that said portion of said river bed is the property of and is subject to the control of the United States.

Bill of plaint Dec

Complainant further charges that the construction of said proposed dam by said defendant will obstruct the flow of the water of said Desplaines river and will overflow the lands adjacent to said river, and that the construction of said dam

ed 1909. by said defendant is an unwarranted interference with and injury to the property of said United States, and will result in irreparable injury thereto, for which injury there is no appropriate or adequate remedy at law;

That said Illinois and Michigan canal is, and has been at all times since its completion in 1848, an artificial navigable waterway of the United States connecting Lake Michigan and the Chicago river with the Illinois and the Mississippi rivers; that said canal joins the Chicago river at a point in Cook County, Illinois; that it passes through portions of the counties of Cook and Will, and connects with said Desplaines river at a point in said Will County near and above the City of Joliet; that said canal follows the bed of said Desplaines river for a distance of between one and two miles, and that at that place the channel of the canal forms the channel of said Desplaines river; that said canal then diverges from said Desplaines river and parallels the course of said river and of the Illinois river, and passes through portions of said Will county and of Grundy and LaSalle counties, and connects with said Illinois river at LaSalle in said LaSalle county; that the place at which said defendant has commenced the construction of said above mentioned dam is about fifteen miles below the point at which said Illinois and Michigan canal diverges from said Desplaines river;

That, after the completion of said canal in 1848, a portion of the water flowing through it was taken from Lake Michigan through said Chicago river, and a portion of the water flowing in said canal after it diverges from said Desplaines river was taken and diverted from said Desplaines river;

That by act of the Illinois legislature of February 28, 1839, it was provided that said Desplaines river, from a point where it most nearly connects itself with the Illinois and Michigan canal to its sources within the boundaries of said State of Illinois, was thereby declared to be a navigable stream, and that it should be deemed and held a public highway and should be and remain free, open and unob-
11 structed for the passage of all boats and water crafts of every description; that by the terms of the ordinance of 1787 it was provided that the navigable waters leading to the Mississippi and St. Lawrence rivers, and the carrying places between the same, shall be common highways and forever free, as well to the inhabitants of the said territory as to the citizens of the United States, and those of any other states that may be admitted into the confederacy, without tax, impost, or duty therefor;

That by the statute of 1846, ch. 89, sec. 3, admitting Wisconsin into the union as a state, it was enacted that the Mississippi and other rivers bordering on said state, and the navigable waters leading into the same, shall be common highways, and forever free, as well to the inhabitants of said state as to all other citizens of the United States, without any tax, duty, impost or toll therefor; that said portion of said Desplaines river within said State of Wisconsin is a navigable stream; and that by virtue of said ordinance of 1787, said act of the congress and said act of the Illinois legislature last above mentioned, the portions of said Desplaines river covered thereby became and are navigable waters of the United States.

Bill of plaint. Dec. 14

Complainant further charges, upon information and belief, that the portion of said Desplaines river between the point at which said Illinois and Michigan canal diverges from said river and its mouth, including the point at which said defendant has commenced the construction of said above mentioned dam, was in its natural condition navigable in fact; that in such natural condition it was capable of use by the public for purposes of navigation, and that by virtue of its connection with the Illinois and Mississippi rivers it formed a highway capable of being used for purposes of interstate and foreign commerce; that the obstructions to the navigability of said river in certain points in said portion of the river arising from shallow places and rapids in the river were capable of being removed and overcome by the improvement of said river, and that pending said improvement said navigable river, irrespective of said shallow places and rapids, is to be deemed an unbroken highway of interstate and foreign commerce, subject to the care and protection of the United States.

Complainant further represents that upon the completion of said Illinois and Michigan canal said portion of said
12 Desplaines river below the point of its connection with said canal by reason of its connection with said canal and the Illinois river formed a part of a continuous highway for interstate and foreign commerce embracing Lake Michigan, the Chicago river, the Illinois and Michigan canal, the Desplaines and Illinois rivers, and the Mississippi river; that by virtue of the connection of said Desplaines river with said other navigable waters of the United States and its relation thereto, said portion of said Desplaines river, without regard to obstructions to navigation at certain places on account of shallow places and rapids, was and is a part of a system

m-
lled
1909.

of navigable waters of the United States, and is to be deemed a navigable water of the United States, subject to the jurisdiction and control of the federal government.

Complainant further represents that by act of May 29, 1889, entitled, "An Act to create sanitary districts, and to remove obstructions in the Desplaines and Illinois rivers," provision was made for the construction under authority of the State of Illinois of a canal connecting the Chicago river with said Desplaines river, through which a large quantity of water was to be diverted from Lake Michigan into said Desplaines river; that it was provided by said act that the channel to be constructed under the provisions thereof should be constructed of sufficient size and capacity to produce and maintain at all times a continuous flow of not less than 300,000 cubic feet of water per minute, and to be of a depth of not less than fourteen feet and with a current not exceeding three miles per hour; that if any portion of any such channel should be cut through a territory with a rocky stratum, where such rocky stratum is above a grade sufficient to produce a depth of water from Lake Michigan of not less than eighteen feet, such portion of said channel should have double the flowing capacity above provided for, and a width of not less than one hundred and sixty feet at the bottom, capable of producing a depth of not less than eighteen feet of water;

That it was further provided by said act that if the population of the district created by said act, draining into such channel, shall at any time exceed 1,500,000, such channel shall be made and kept of such size and in such condition that it will produce and maintain at all times a continuous flow of not less than 20,000 cubic feet of water per minute for each 100,000 of the population of such district, at a current of not more than three miles per hour, and if at any time
13 the general government shall improve the Desplaines or Illinois rivers, so that the same shall be capable of receiving a flow of 600,000 cubic feet of water per minute, or more, from said channel, and shall provide for the payment of all damages which any extra flow above 300,000 cubic feet of water per minute from such channel may cause to private property so as to save harmless the said district from all liability therefrom, then such sanitary district shall within one year thereafter, enlarge the entire channel leading into said Desplaines or Illinois rivers from said district to a sufficient size and capacity to produce and maintain a continuous flow throughout the same of not less than 600,000 cubic feet of water per minute, with a current of not more than three miles

per hour, and such channel shall be constructed upon such grade as to be capable of producing a depth of water not less than eighteen feet throughout said channel, and shall have a width of not less than one hundred and sixty feet at the bottom; that, in case a channel is constructed in the Desplaines river as contemplated in said act, it shall be carried down the slope between Lockport and Joliet to the pool commonly known as the upper basin of sufficient width and depth to carry off the water the channel shall bring down from above; Bill of complaint, Dec. 14,

That it is further provided in said act that the district constructing a channel to carry water from Lake Michigan of any amount authorized by said act, may correct, modify and remove obstructions in the Desplaines and Illinois rivers wherever it shall be necessary so to do to prevent overflow or damage along said river, and shall remove the dams at Henry and Copperas Creek in the Illinois river, before any water shall be turned into the said channel; and it is further provided by said act that whenever the board of trustees of said sanitary district shall pass an ordinance for the making of any improvement which such district is authorized to make, the making of which will require that private property should be taken or damaged, such district may cause compensation therefor to be ascertained and condemn and acquire possession thereof in the same manner, as nearly as may be, as is provided in an act entitled, "An Act to provide for the exercise of the right of eminent domain," approved April 10, 1872, provided, however, that proceedings to ascertain the compensation to be paid for taking or damaging private property should in all cases be instituted in the county where the property sought to be taken or damaged is situated; that
14 it is further provided in said act that said sanitary district constructing said canal shall be liable for all damage to real estate within or without such district which shall be overflowed or otherwise damaged by reason of the construction, enlargement or use of any channel, ditch drain, outlet or other improvement under the provisions of said act, and that actions to recover such damages may be brought in the county where such real estate is situate or in the county in which such sanitary district is located, at the option of the party claiming to be injured; that it is further provided in said act that when it shall be necessary, in making any improvements that said district is authorized by said act to make, to enter upon any public property, or property held for public use, such district shall have the power to do so, and

om-
filed
1909.

may acquire the necessary right of way over such property held for public use in the same manner as is above provided for acquiring private property, and may enter upon, use, widen, deepen and improve any navigable or other waters, waterways, canal or lake; that it is further provided by said act that when said channel of said sanitary district shall be completed and the water turned therein to the amount of 300,000 cubic feet of water per minute, the same is thereby declared a navigable stream, and that whenever the general government shall improve the Desplaines and Illinois rivers for navigation to connect with said channel, said general government shall have full control over the same for navigation purposes, but not to interfere with its control for sanitary or drainage purposes;

That pursuant to the provisions of said act of March 29, 1889, and under the authority of said State of Illinois, the Sanitary District of Chicago, created pursuant to the provisions of said act, did construct a canal connecting the Chicago river with said Desplaines river; that said canal connects with said Desplaines river at a point about one and one-third miles above the point at which the Illinois and Michigan canal connects with said river; that upon the completion of said sanitary district canal, and prior to the commencement of the construction by the defendant of the dam in the Desplaines river hereinabove mentioned, to wit, in the year 1900, said Sanitary District of Chicago, pursuant to its said authority from the State of Illinois, did divert through said canal from Lake Michigan into said Desplaines river, water to the amount of about 300,000 cubic feet per minute, and that continually since the opening of said sanitary district canal there has been diverted from Lake Michigan through said canal into said Desplaines river, at a point above that at which said defendant has commenced construction of said above mentioned dam, a quantity of water amounting to about 300,000 cubic feet per minute; that said sanitary district canal, so constructed under authority of the State of Illinois, is, and has been since the opening of said canal in 1900, water navigable in fact, and is, and has been since said time, a part of the navigable waters of the United States, and subject to the jurisdiction and control of the federal government; that in connection with the construction of said sanitary district canal, and in creating the system of waterways resulting from the construction of said canal, said State of Illinois has caused the quantity of water flowing through said Desplaines river below the point at which it connects with said canal, to be largely increased,

and that said portion of said river has been continuously, since the opening of said canal, and is now water navigable in fact and a part of the navigable waters of the United States and subject to the jurisdiction and control of the federal government; that since said State of Illinois has thus artificially increased the quantity of water flowing through said portion of said Desplaines river, the only substantial obstructions to the navigability of said river are certain rapids between the portion of said river known as the upper basin, namely, the portion of said river in which it follows the channel of the Illinois and Michigan canal, and the portion of said river known as Lake Joliet, and certain other rapids at Treat's Island and Dresden Heights in said river; that, with the exception of the difficulties arising on account of said rapids said river has been, since the opening of said sanitary district canal, and now is, capable of being navigated for the purposes of commerce, and that difficulties arising on account of said rapids abve mentioned are capable of being overcome through the improvement of said river by locks, canals and dams.

Bill of complaint, Dec. 14,

Complainant further charges that in connection with, and as a result of, the construction of said sanitary district canal and the diversion of said water from Lake Michigan, said Sanitary District of Chicago, acting under authority of said State of Illinois, has largely increased the navigability of said Desplaines river, and that continuously since the opening of said canal there has been and is in said portion of said Desplaines river, below the point at which it connects with
16 said canal, a body of water navigable in fact, and which by virtue of its connection with other navigable waters is to be deemed a part of the navigable waters of the United States, and subject to the jurisdiction and control of said United States; that the control of said United States over said body of navigable water in the exercise of its power to regulate commerce, exists irrespective of controversies between said State of Illinois and property owners along said Desplaines river as to compensation for damages alleged to have been inflicted through the diversion of said water from Lake Michigan into said Desplaines river; and that said power of control of said United States over said body of water is in no respect diminished or taken away by the failure of said State of Illinois or its agency, said Sanitary District of Chicago, to compensate said property owners along said Desplaines river for property rights which have been damaged or lost

Com-
filed
, 1909.

by reason of said diversion of water from Lake Michigan into said Desplaines river.

Complainant further represents that by section 9 of the river and harbor appropriation act of March 3, 1899, ch. 425, it is provided:

"That it shall not be lawful to construct or commence the construction of any bridge, dam, dike, or causeway over or in any port, roadstead, haven, harbor, canal, navigable river or other navigable water of the United States until the consent of Congress to the building of such structures shall have been obtained and until the plans for the same shall have been submitted to and approved by the Chief of Engineers and by the Secretary of War; Provided, That such structures may be built under authority of the legislature of a State across rivers and other waterways the navigable portions of which lie wholly within the limits of a single State, provided the location and plans thereof are submitted to and approved by the Chief of Engineers and by the Secretary of War before construction is commenced;"

That in the year 1907 said defendant commenced the construction of said dam in said Desplaines river, and has already constructed a portion thereof; that said defendant has never obtained the consent of congress to the building of said dam, nor have the location and plans for the construction of said dam been approved by the Chief of Engineers and by the Secretary of War, as required by said act; and that, on the contrary, said defendant asserts and maintains that said Desplaines river is not a navigable river or a navigable water of the United States, and that the authority and permission provided by said act of March 3, 1899, is not required for the construction of said dam; that said defendant has refused, and refuses, to remove the portion of said dam already constructed, and threatens to, and will, complete the construction of said dam unless prevented by the injunction of this court. Complainant further charges that the portion of said dam already constructed is a structure erected in violation of the provisions of said act of March 3, 1899, and that if the construction of said dam is completed by said defendant said structure will be a permanent obstruction in said river, and will irreparably injure and damage the rights and property of the United States relating to and connected with the system of navigable waters hereinabove mentioned.

17

In consideration whereof, and inasmuch as adequate rem-

edy in the premises can only be obtained in this court, the United States of America prays this court to order, adjudge and decree that said Desplaines river is a navigable river, and one of the navigable waters of the United States; that the portion of said dam which has been constructed by said defendant as hereinabove set forth, is a structure erected in violation of the provisions of section 9 of the Act of March 3, 1899, and that its removal should be enforced by the injunction of this court; that the threatened completion of said dam by said defendant without the permission and authority required by said act will be contrary to the provisions of said act, and will result in irreparable injury and damage to the property and rights of the United States, and that said defendant, its officers and agents, and all persons acting for it, should be enjoined perpetually from placing any further obstruction in said Desplaines river, and from doing any other act or performing any other work in connection with the erection or construction of said dam.

Bill of complaint, Dec. 14,

To the end, therefore, that the United States of America may obtain the relief to which it is justly entitled in the premises, may it please Your Honors to grant to it the writ of subpoena directed to said defendant, the Economy Light and Power Company, commanding it to appear herein and answer, but not under oath (answer under oath being hereby expressly waived), the allegations contained in the foregoing bill of complaint, and abide by and perform such order
18 and decree as the court may make in the premises and upon hearing hereof to permanently enjoin the defendant as hereinbefore prayed, and pending the final hearing of this cause, cause a temporary restraining order to issue enjoining said defendant, its officers, agents and servants, and all persons acting for it, as hereinbefore prayed.

GEORGE W. WICKERSHAM,
Attorney General of the United States.
EDWIN W. SIMS,
United States Attorney for the Northern District of Illinois.
JAMES H. WILKERSON,
Special Assistant United States Attorney.

com- filed 4, 1909.

19 United States of America,

Edwin W. Sims, having been first duly sworn, says that he is United States Attorney for the Northern District of Illinois; that he has read the foregoing bill of complaint and knows the contents thereof; that the same is true of his own knowledge except as to those matters therein stated on his information and belief, and as to those matters he believes them to be true. He further states that he is authorized to sign said bill of complaint for the United States of America, the complainant therein, by the Attorney General of the United States.

EDWIN W. SIMS,

Subscribed in my presence and sworn to before me this 14th day of December, A. D. 1909.

WILLIAM A. SMALL,
(Seal) *Notary Public.*

(Endorsed) Filed Dec. 14, 1909. H. S. Stoddard, Clerk.

20 And afterwards to-wit: on the twenty-eight day of February, 1910, came the defendant in said entitled cause by its solicitors and filed in the clerk's office of said court, its certain Answer in words and figures following towit:

21 IN THE CIRCUIT COURT OF THE UNITED STATES Answer, Feb. 2[illegible]

Northern District of Illinois,

Eastern Division.

United States of America
vs.
Economy Light & Power Company.

ANSWER OF THE ECONOMY LIGHT AND POWER COMPANY, DEFENDANT, TO THE BILL OF COMPLAINT OF THE UNITED STATES OF AMERICA, COMPLAINANT:

This defendant, reserving to itself all right of exception to the said Bill of Complaint, and reserving to itself the same rights under this answer as if it had demurred or pleaded to said Bill of Complaint for the matters and things herein set forth, says:

First. That said bill is multifarious, in that it joins a cause of action which affects only the alleged property rights of the United States, in and to the land and river bed within the meander lines of the Desplaines River, and in which the public have no right or interest, with a cause of action wherein the United States, in its sovereign political capacity, is seeking to enforce the alleged rights of the public in and to such stream as a navigable water of the United States, a matter in which said United States has, and claims, no property rights.

Second. That the allegations of said bill as to the ownership by complainant of the lands and river-bed within the meander lines of said Desplaines River, do not state a cause of action cognizable in a court of equity.

22 Third. That said bill, while claiming that the title to the lands and river-bed within the meander lines of said Desplaines River is in complainant, shows that there is an adverse claim of ownership of said lands by the defendant and does not show that the title of complainant to said lands has been determined in an action at law.

Fourth. That said bill, while alleging that the Desplaines River is a navigable stream, claims that the title of the United States in and to the land in the bed of said stream in that portion of said stream in Section 25, Township 34 North

Filed 1910. of Range 8 East of the Third Principal Meridian, in Grundy County, Illinois, in which defendant is seeking to construct its dam, never passed to the State of Illinois.

Fifth. That said bill alleges that by reason of the additional water discharged into it from the channel of the Sanitary District of Chicago, the Desplaines River has become a navigable stream and claims relief on that ground.

Sixth. That said bill alleges that by virtue of the ordinance of 1787, said Desplaines River became navigable waters of the United States.

Seventh. That said bill alleges that by virtue of the Act of the Legislature of Illinois of February 28, 1839, the portion of said Desplaines River therein referred to became navigable waters of the United States.

Eighth. That said bill alleges that by virtue of the Act of Congress admitting Wisconsin into the Union, the portion of said Desplaines River situated within the State of Wisconsin became navigable waters of the United States.

Ninth. That said bill does not allege that the dam,
23 the construction of which it seeks to restrain, will interfere with commercial navigation upon said river.

Tenth. That said bill does not allege that there is any commercial navigation upon said river which will be interfered with or obstructed by the completion or maintenance of said dam.

Eleventh. That said bill shows that defendant is in possession of the land and river-bed, within the meander line of said Desplaines River in said Section 25, Township 34, Range 8 East of the Third Principal Meridian, in Grundy County, Illinois, under bona fide claim of title thereto, deduced from the State of Illinois, and seeks to divest defendant of its title thereto, and this defendant, by virtue of the seventh amendment to the constitution of the United States and Section 5 of Article II of the constitution of the State of Illinois, has a right to have its title determined in a court of law by a jury.

Twelfth. That by virtue of Section 35 of Chapter 45 of the Revised Statutes of the State of Illinois, this defendant is entitled to have its claim of title determined in two separate trials before two separate juries.

And defendant prays the same benefit and advantage of the above matters as if it had specifically pleaded or demurred to said bill therefor.

This defendant not waiving all or any of said grounds of demurrer, but insisting and relying upon each of them, further answering, says:

That it admits that it is a corporation duly organized under the laws of the State of Illinois, but denies that its office and principal place of business is in Chicago, in the County of Cook. Answer Feb. 28

Further answering, defendant admits that without the consent of Congress, and without the authority of the
24 Legislature of Illinois, and without the approval by the chief of engineers or the secretary of war (except as hereinafter set out) of the location and plans therefor, it has commenced the construction of a dam in the Desplaines River at a point in said river in Grundy County, in the State of Illinois, and within said Northern District of Illinois, and has already constructed a part of said dam; but denies that the portion of said Desplaines River in which the construction of said dam has been commenced is navigable water of the United States, or that it is a navigable water.

Defendant admits that said Desplaines River has its source in the State of Wisconsin and flows in a southerly direction into the State of Illinois, and through the northern portion of said State, into Grundy County, in said State, where it unites with the Kankakee River and forms the Illinois River, and that last named river flows through a portion of the State of Illinois into the Mississippi River, as is alleged in said Bill of Complaint.

Defendant admits that it claims to be the riparian owner of land along both sides of the said Desplaines River, at the point where the construction of said dam has been commenced, and admits that its title to said land is based upon mesne conveyances from one Charles E. Boyer, and that said Boyer obtained title to said land through a deed from the Board of Trustees of the Illinois and Michigan Canal, dated October 22, 1860, and conveying to said Boyer certain land therein described, substantially as set forth in said Bill of Complaint, and that the portion of said Desplaines River in which the construction of said dam has been commenced by this defendant flows through the land described in said deed to Boyer.

25 This defendant admits the adoption by Congress of the Act of March 30, 1822, entitled "An Act to authorize the State of Illinois to open a canal through the public lands, to connect the Illinois River with Lake Michigan," but for the provisions of said Act it refers to 3 U. S. Stats, at large, page 269, et seq., where said act in full and at length appears. But this defendant avers that the State of Illinois did not comply with the provisions of said act, and that said act, by the terms thereof, became "void and of none effect."

Filed 1910.

This defendant admits the adoption by Congress of the Act of March 2, 1827, entitled "An Act to grant a quantity of land to the State of Illinois, for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of Lake Michigan," for the provisions of which act it refers to 4 U. S. Stats. at large, page 234, et seq., where said act in full and at length appears.

Defendant admits that by said act of 1827 there was granted to said State of Illinois, for the purpose of aiding the State in opening a canal to unite the waters of the Illinois River with those of Lake Michigan, a quantity of land equal to one-half of five sections in width on each side of said canal. And defendant avers that it was provided in such act that such land should be subject to the disposal of the Legislature of the State, for the purpose aforesaid and no other, that so soon as the route of said canal should be located and agreed upon by said State, it should be the duty of the Governor thereof, or of such other person or persons as should have been authorized to superintend the construction of said canal, to examine and ascertain the particular sections to which the State would be entitled under the provisions of said
26 act and report the same to the Secretary of the Treasury of the United States, that after the selection of such lands should have been so made, the State under the authority of its Legislature, should "have power to sell and convey the whole or any part of said lands, and give a title in fee simple therefor, to whomsoever should purchase the whole or any part thereof."

And defendant avers that on, to-wit, the 22nd day of January, 1829, the Legislature of the State of Illinois passed an act authorizing the Governor of the State, by and with the advice of the Senate, to appoint three commissioners, whose duty it should be, among other things, to superintend the construction of said canal and to select the alternate sections of land granted to said State as aforesaid and that pursuant to such act, the Governor of the State of Illinois, by and with the consent of the Senate thereof, appointed commissioners of the Illinois and Michigan Canal, for the purposes and with the powers in said act provided; that pursuant to said act of Congress of December 2, 1827, and said act of the Legislature of Illinois of January 22, 1829, the route of said canal was laid out; and that in December, 1829, the said Canal Commissioners did select each alternate section having an odd number along the route of said canal. And defendant admits that in December, 1829, a map showing the route of said canal

and the land so selected by the Canal Commissioners was filed with the Treasury Department of the United States. And defendant avers that by virtue of said act of Congress of March 2, 1827, and the act of the Legislature of the State of Illinois of January 22, 1829, and the location of the route of the Illinois and Michigan Canal, and the selection by said
27 commissioners of the Illinois and Michigan Canal of lands thereunder, each alternate section having an odd number along the route of said canal, including the land and river bed within the meander lines of said Desplaines River in said Section 25 vested in the said State of Illinois, immediately upon the filing of said map showing the route of said canal, and that thereupon said state, under authority of its Legislature, had full power to sell, convey and give title to any and all of said lands, including the bed of said stream, in said Section 25. Answer Feb.

This defendant admits that prior ot the passage of said act of Congress above mentioned, to-wit, during the year 1821, the United States made a survey of public lands along and adjacent to the said Desplaines River, including the portion thereof in which the construction of said above mentioned dam has been commenced, but denies that it caused said Desplaines River to be meandered, or fixed and determined upon its said survey of public lands the meander lines of said river, or that such surveys showing said meander lines were made, or have been continuously since the time of said surveys, a part of the public records of said United States relating to the public lands.

Defendant admits that the construction of said Illinois & Michigan Canal was commenced in the year 1837, and was completed in the year 1848; admits the adoption by the legislature of the State of Illinois of the Act of February 26, 1839, entiiled "An Act to amend the several laws in relation to the Illinois & Michigan Canal," and for the provisions of said act it refers to the laws of Illinois of 1839, page 177, et seq., where said act in full and at length appears. Defendant denies that it was provided in said act that "lands situated upon streams which have been meandered by the sur-
28 veys of public lands by the United States shall be considered as bounded by the lines of those surveys, and not by the stream," but avers that it was provided in Section 2 that in all sales of lands and lots under the provisions of said act certain conditions should be annexed, and should compose a part of the contract, which conditions included the provision hereinabove last quoted. Defendant denies that

ed. 1910. in or by said act of 1839 the legislature of the State of Illinois declared it to be its understanding that said grant of March 2, 1827, did not include the land and the river bed within said meander lines, and denies that said State of Illinois did not accept any grant of land and river bed within said meander lines to be disposed of for the purpose specified in said act of March 2, 1827, and denies that there never was any acceptance by said State of Illinois of the land and river bed within said meander lines as a part of said grant under said act of March 2, 1827, and denies that upon the surveys of said State of Illinois, showing the land accepted by it under said grant of March 2, 1827, for disposal by said state pursuant to said act, it was indicated that the land and river bed within said meander lines, including that portion of the bed of the Desplaines River where this defendant has commenced the construction of its said dam, was not included in the lands accepted by said State of Illinois, to be disposed of pursuant to the terms of said act of March 2, 1827, but, on the contrary thereof, this defendant avers that the said State of Illinois has at all times insisted and declared, and does now insist and declare, that by the said grant of March 2, 1827, and the selection by the Canal Commissioners of each alternate section under said grant, and the filing of said map
29 with the Treasurer of the United States, the title to the land and the river bed within the said meander lines passed from the said United States to the said State of Illinois for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of Lake Michigan, as set forth in said act.

Defendant avers that if said Desplaines River is a navigable stream, as alleged in said bill of complaint, which defendant denies, then the title to the bed of said stream passed from the United States to the State of Illinois upon the admission of said State into the Union in 1818.

Defendant admits the adoption by the legislature of the State of Illinois of the act of February 21, 1843, entitled "An Act to provide for the completion of the Illinois & Michigan Canal, and for the payment of the canal debt," and for the provisions thereof defendant refers to the laws of Illinois of 1843, page 54, et seq., where said act in full and at length appears. And defendant avers that said act authorized said Board of Trustees to take possession of said canal lands, property and assets granted to them by said act and to proceed to complete said canal; and this defendant avers that the commissioners appointed pursuant to said act did take

possession of said canal, lands, property and assets, including the lands within the meander lines and the bed of said river in said Section 25, and after the completion of said canal in 1848 proceeded to sell the lands in payment of said canal debt, and avers that under and by virtue of said act of February 21, 1843, the said Board of Trustees sold and conveyed to defendant's predecessor in title, Charles E. Boyer, the lands in said Section 25, including the lands within the meander lines and in the bed of said river whereon defendant is constructing its said dam. Answer, Feb. 2

But defendant denies that pursuant to authority under said act of February 21, 1843, said Board of Trustees of the Illinois & Michigan Canal, in the year 1846, caused a survey of said lands to be made, showing the lands granted by the United States and accepted by the State of Illinois, to be disposed of by said State for the purpose specified in said act of March 2, 1827, and denies that upon said alleged survey the meander lines of said Desplaines River, as alleged to have been shown by said government survey mentioned in said bill of complaint were designated as the boundaries of lands granted by the United States and accepted by the State of Illinois for disposal under the terms of said act of Congress of March 2, 1827, and avers that said Trustees had no power to limit by survey or otherwise the quantity of land granted to or accept by said State of Illinois under said act of Congress of March 2, 1827, or the quantity of land granted to them by said act of February 21, 1843, and denies that the sale of said lands by said State of Illinois to said Boyer, this defendant's predecessor in title, was made in accordance with said alleged survey of said Board of Trustees of said Illinois & Michigan Canal, and denies that upon said survey the portion of said Desplaines River in which this defendant has commenced the construction of said dam, is designated as within said meander lines, or that it is not included among the lands granted by the United States and accepted by the State of Illinois for disposal, pursuant to said act of Congress of March 2, 1827; denies that the alleged survey of said Board of Trustees was made under authority of the State of Illinois, or that the boundaries, as alleged to have been shown thereon with respect to the lands granted by the United States and accepted by the State of Illinois, for disposal in accordance with the terms of said act of March 2, 1827, were ratified, accepted or acted upon by said State of Illinois in all or any of its transactions relating to said lands, and denies that under said grant of March 2, 1827, said State of

Filed ... 1910.

Illinois did not acquire any title to or interest in that portion of the bed of the Desplaines River where this defendant has commenced the construction of the dam mentioned in said complaint, or that said Boyer, by said deed from the said Board of Trustees of the Illinois & Michigan Canal, did not acquire any title to or interest in that part of the bed of said river, and denies that this defendant has no title to or interest in that portion of the bed of said Desplaines River where it has commenced the construction of its dam above mentioned, and denies that said portion of said river bed is the property of, or is subject to the control of, the United States. And defendant avers that it and its predecessors in title have been in undisturbed and peaceable possession of the land and river bed within the meander lines of said Desplaines River, in said Section 25, for over fifty years under bona fide claim of title thereto; and that the claim of the United States thereto is stale; and that the said United States ought not at this day to be heard in a court of equity to claim title thereto.

This defendant admits that the construction of its said dam will obstruct the flow of the water of the said Desplaines River to some extent and will overflow the lands adjacent to said river, but it denies that construction of said dam by defendant is an unwarranted interference with or injury to the property of said United States, or that it will result in irreparable, or any, injury thereto, but, on the contrary
32 thereof, defendant alleges that all of the land along said river which will be overflowed by the construction of said dam belongs to this defendant, and that no injury will result to any property of the United States by the construction of said dam.

Defendant admits that the Illinois & Michigan Canal is and has been, since its completion in 1848, an artificial navigable waterway connecting the Chicago River with the Illinois River, but denies that said canal is a navigable waterway of the United States; admits that said canal passes through portions of the counties of Cook and Will, and connects with said Desplaines River at a point in Will County near and above the City of Joliet; that said canal follows the bed of said Desplaines River for a distance of between one and two miles, and that at that place the channel of the canal and the channel of the river occupy the same space, and that said canal then diverges from said Desplaines River and parallels the course of said river and of the Illinois River, and passes through portions of Will, Grundy and La Salle counties, and connects with the said Illinois River at La Salle, in La Salle

County; that the place at which defendant has commenced the construction of its dam is about fifteen miles below the point at which the Illinois & Michigan Canal diverges from said Desplaines River. Answer, Feb.

Defendant admits that after the completion of the canal in 1848, a portion of the water flowing through it was taken from Lake Michigan, through said Chicago River, and that a portion of the water flowing in said canal after it diverges from said Desplaines River was taken and diverted from the Desplaines River.

Defendant admits the adoption by the legislature of the State of Illinois of the act of February 28, 1839, mentioned in said bill of complaint, but for the provisions of said
33 act it refers to the laws of 1839 of the State of Illinois, page 208, where said act in full and at length appears. But defendant avers that the point at which it is building its said dam is not in that part of said Desplaines River referred to in the said act, and that it is not competent for the State of Illinois to create a navigable stream by a statutory declaration of navigability.

Defendant admits that it was provided in the ordinance of 1787 that the navigable waters leading into the Mississippi and St. Lawrence and the carrying places between the same should be common highways, and forever free as well to the inhabitants of said territory as to the citizens of the United States and those of any other states that might be admitted into the confederacy, without any tax, imposed or duty therefor, but defendant avers that upon the admission of Illinois into the Union as a state in 1818, that provision of the ordinance of 1787 cease to have any force or effect within said State.

Defendant denies that the provisions of the statute of 1846, page 89, section 3, admitting Wisconsin into the Union as a state, applies to said Desplaines River, and denies that the portion of the Desplaines River within the said State of Wisconsin, or that portion thereof within the State of Illinois ever were, or now are, navigable, or that said Desplaines River ever was or now is a navigable water of the United States, and denies that said ordinance of 1787, or said act of Congress admitting Wisconsin into the Union, or the said act of the Illinois legislature referred to in said bill of complaint, or all of them, had the effect of making said Desplaines River or any portion thereof navigable waters or navigable waters of the United States, or in any wise affected the char-

Filed Dec. 8, 1910.

acter of said stream or the rights of riparian owner thereon.

34 This defendant denies that the portion of said Desplaines River between the point at which said Illinois and Michigan Canal diverges from said river and its mouth, including the point at which this defendant has commenced the construction of its said dam, was in its natural condition navigable in fact; denies that in such natural condition it was capable of use, or ever was used, by the public for purposes of navigation; denies that by virtue of its connection with the Illinois and Mississippi Rivers it formed a highway capable of being used for purposes of interstate or foreign commerce; admits that the obstructions to the navigability of said river arising from shallow places and rapids in this river, are capable of being removed and overcome by the improvement of said river; but avers that such obstructions can only be removed or overcome by the construction of dams and channels in said river of such extent and nature as to entirely change the character of said river, and create a navigable stream where none now exists; and denies that pending such improvements, said river, irrespective of such shallow places and rapids, is to be deemed an unbroken highway of interstate or foreign commerce or of intrastate commerce, or that it is subject to the care and protection of the United States.

Defendant denies that upon the completion of said Illinois and Michigan Canal, said portion of said Desplaines River below the point of its connection with said canal, by reason of its connection with said canal and the Illinois River, formed a part of a continuous highway for interstate or foreign commerce, embracing Lake Michigan, the Chicago River, the Illinois and Michigan Canal, the Desplaines and Illinois Rivers, and the Mississippi River, or that by virtue of the

35 connection of said Desplaines River with said navigable waters of the United States, or its relation thereto, said portion of the Desplaines River, without regard to obstructions to navigation at certain places, or on account of shallow places and rapids, was or is a part of a system of navigable waters of the United States, or is to be deemed a navigable water or navigable water of the United States or subject to the jurisdiction and control of the Federal Government.

But, on the contrary, defendant avers that the said Desplaines River in its original or natural state or condition was not, and that it is not now, a navigable stream and was not, and is not, capable of being navigated for purposes of com-

merce, and that said stream has never been used for purposes of useful or commercial navigation. Answer, filed Feb. 28, 1

Defendant avers that the United States has during a period of over one hundred years treated said Desplaines River as a non-navigable stream; that it has several times had said stream surveyed for the purpose of ascertaining the possibility of creating a navigable channel therein but that the reports of engineers making said surveys have shown that said stream was not a navigable stream; and that it has, without protest, permitted dams and bridges to be constructed in, over and across, said stream from the earliest day down to the present time without its consent, and has in fact never exercised or attempted to exercise any jurisdiction or control over said stream or any part thereof.

Defendant further avers that one Charles A. Munroe and associates, during the year 1904, acquired by purchase from the owners thereof, some 1,800 acres of land lying on both sides of the Desplaines River in Will and Grundy Coun-
36 ties, the ownership of which gave to the said Munroe and associates the right to construct a dam at the mouth of the Desplaines River.

Defendant avers that before the beginning of the construction of its said dam, and in order that said dam might be located at such a point as would contribute to a waterway, if one should ever be constructed in said stream, said Charles A. Munroe submitted the plan of said proposed dam to the War Department of the United States and requested that said Department would give some expression of opinion as to whether or not the plans submitted would be in harmony with the work of improvement proposed—but not then, nor at any time thereafter determined on—by the United States Government, to-wit: the construction of a navigable waterway from Lockport, Illinois, to St. Louis, Missouri, via the Desplaines, Illinois and Mississippi Rivers; and that thereupon the Chief of Engineers of the United States Army referred the matter to Lieutenant-Colonel W. H. Bixby of the Corps of Engineers of the United States Army in charge of the district in which said proposed work was to be constructed, to examine said plans and said proposed work and to report his recommendations thereon; that thereupon the said Bixby reported to the Chief of Engineers of the United States Army as follows:

of
. Bixby,
Mar.
906.

United States Engineer Office,
508 Federal Building,
Chicago, Ill., March 27, 1906.

Brig. Gen. A. Mackenzie,
Chief of Engineers, U. S. Army,
Washington, D. C.

General:

1. In reply to Department letter (E. D. 58726) dated March 16, 1906, as to the proposed plans of a water power
37 company for a dam across the Desplaines river, Ill., just above its mouth, which have been verbally and informally presented to your office by the Hon. H. M. Snapp and the water power representatives, I have herewith to submit report as follows:

2. The dam in question is that proposed by Chas. A. Munroe, of Chicago, Ill., as explained by his letter to this office under date of March 20, 1906, with inclosures (copies herewith—2 letters, 3 blueprints), (5 incls.).

3. The Desplaines River, so far as now known to this office, has never yet been considered a navigable stream of the United States. It is therefore apparently as yet subject only to such jurisdiction as applies to all other unnavigable streams and not subject to the provisions of Section 9-13, Act of March 3, 1899, or to other similar U. S. legislation.

4. The agents of the water power company in question, informally claim to have secured possession of all the land on each bank of the river necessary to allow for construction of the dam and of its accessories, and to protect themselves from all future claims for over-flowage created thereby, so far as any existing known rights are concerned; and they likewise claim that there is no existing State law, or United States law which prohibits their legally going ahead with their proposed construction and that no special law is needed therefor. They admit, however, that in some minor matters, they still lack necessary authority from the local Board of Supervisors, to condemn certain properties which they still wish to acquire in order to facilitate or simplify their future work (such permission, however, not being absolutely essential to such work) and they state that the Board of Supervisors are willing to grant such authority as soon as it is evident that the proposed power dam construction will not interfere with the future development of the river for navigation purposes.

5. The water power company agents likewise state that

their object in bringing the matter up before the War De-
38 partment at present, is to make evident that the pro-
posed dam construction not only does not conflict with any existing U. S. law, but also will assist rather than injure the possible future navigation of the Desplaines and Illinois Rivers, should the improvement of such rivers ever be authorized by Congress in the manner proposed by the last Board Report of August 26, 1905, upon the feasibility and cost of a navigable waterway from Lockport, Ill., to St. Louis, Mo., via the Desplaines, Illinois, and Mississippi Rivers (House Document No. 263, 59th Congress, 1st Session); and they desire to secure from the War Department some expression of opinion, informal or otherwise, so far as it can properly be given, that will allow them to assure all inquiries that the War Department so understands the situation and is making no objection to such prompt progress of the work as is necessary to a business enterprise of its magnitude and importance.

Report of W. H. Bi dated Ma 27, 1906.

6. Paragraph 17 of the Board Report of August 26, 1905, above referred to, specially stated that the plan submitted by the Board was 'not designed to develop water power, but there will probably be no difficulty in modifying it so as to conform to such development if those who are to benefit thereby will co-operate with the Government. They should pay the cost of the dams, and the damage from flowage, which is no more than they would be compelled to do if the Government made no improvement.' The plans herewith submitted by Mr. Munroe show plainly a proposed co-operation such as that described in the above Board Report, offered in such manner as not only to pay the cost of this power dam, and to protect the United States against flowage damage, but also to lessen by one the number of locks and dams necessary for future navigation and to otherwise save both time and money ($142,385 in first cost and $4,000 annually thereafter for maintenance and operation) to the United States, in case Congress should finally decide to undertake the improvement covered by the August 26, 1905, Board Report, or to otherwise make this river navigable in this neighborhood. All informa-
39 tion, so far as received by this office, appears to substantiate the statements of Mr. Munroe, as described above; and I consider that his proposition should be encouraged and that he should receive from the War Department whatever expression of favorable consideration may be proper and allowable under such circumstances.

7. I have carefully considered the question of this power

of H. Bixby, d Mar. 1906.

dam project and have talked it over at intervals with Mr. Woermann, while he was Assistant Engineer in local charge of the Illinois River survey under this office before he had been employed by Mr. Munroe, as well as since that time, and have discussed the matter also with Mr. Munroe; and I believe that the provisos of the next paragraph below are fair and advantageous to both sides, and will leave to the future only the question of regulating pool levels so as to avoid a conflict between depths of water needed for navigation and heads of water needed for power purposes, and so as to divide up the river water between the two according to such rights as may exist when the river shall become a navigable water (which it appears not be at present) and when the United States shall decide to give up the use of the canal and to assume the improvement of the river. Until such time, I do not see how the War Department can assume any definite jurisdiction of the Desplaines River or make any definite demands upon any water-power company already organized for the use of this river. It is my present understanding that these provisos will be accepted by Mr. Munroe.

8. I have therefore to recommend that the Hon. H. M. Snapp and Mr. Charles A. Munroe be informed that the War Department will waive any and all objections which it may have to the progress of such water power dam construction as proposed by Mr. Munroe's letter of March 20, 1906, and its inclosures, provided that he, on the part of the power dam owners, agrees

(a) that he will construct and maintain in good repair, just above the mouth of the Desplaines River, in location as approximately shown on the blue prints, a dam and spillway sufficient to hold the water surface of its upper pool at a height equal to the present mean level of Lake Joliet (taken at 512.0 feet, Memphis datum); and later whenever Congress shall have ordered the improvement of the Desplaines River for navigation purposes, will raise this dam 3.0 feet higher (giving pool level of 515.0 feet, Memphis datum) if the War Department shall so order; and will grant the United States the use of such pool so far as needed for navigation.

(b) that he will assume the cost of, and protect the United States from, claims for all flowage damages caused by this dam between its site and the north line of Section 11, Township 34, Range 9 East, which line is about 1.5 miles by river above the next higher lock and dam proposed by the Board re-

port (i. e., Lock No. 4 and Dam No. 2, at the foot of Treat's Island); Report of W. H. Bi dated Ma 27, 190

(c) that he will grant the United States a strip of land at least 150 feet wide across the north end of this dam, to be so located between it and the tow path of the present Illinois and Michigan Canal, as to connect the present mid river above, to the same below, in the manner approximately indicated on the accompanying blue prints; such strip to be used by the United States for the construction and maintenance of a boat lock, its necessary approaches, and the purposes of navigation;

(d) That he will do all the above, free of cost to the United States;

Provided that the War Department will waive any and all objections which it may have to the progress of such water power dam construction.

Very respectfully,

W. H. Bixby,
Lt. Col., Corps of Engineers.

June 5, 1906.

41 That there upon the Chief of Engineers of the United States Army concurred in said recommendations and reported the result of his findings and his recommendations to the Secretary of War; and thereupon, and on or about the 7th day of June, 1906, the War Department, by Robert Shaw Oliver, Assistant Secretary of War, sent to said Charles A. Munroe, a letter reading as follows:

War Department. Letter, June 7, 19
Washington, June 7, 1906.

Sir—

In reply to your letter of June 5, 1906, addressed to the War Department, in the matter of the construction by yourself and associates of a dam and spillway across the Desplaines River near its mouth, at the location and as shown on maps, submitted with your letter of March 20th, 1906, addressed to Lieutenant-Colonel W. H. Bixby, Corps of Engineers, U. S. Army, I have the honor to advise you as follows:

It is understood that yourself and associates are willing to comply with the following conditions, viz:

7, 1906. First. That the details of construction shall be such as to insure permanency and of sufficient capacity to hold the water surface of its upper pool at a height equal to the present mean level of Lake Joliet (taken at 512.0 feet Memphis datum); and later whenever Congress shall have ordered the improvement of the Desplaines River for navigation purposes, the dam shall be raised by you and your associates 3.0 feet higher (giving pool level of 515.0 feet, Memphis datum), if the War Department shall so order; the United States and the public to have the free use of such pool so far as needed for navigation purposes, and the use of water for power purposes shall be so limited that the level of the pool shall at no time be reduced below that adopted for navigation in the plans of the United States for the slack-water improvement of the river.

Second. That the United States shall be protected from
42 claims for all flowage damages caused by the dam between its site and the north line of section 11, township 34, range 9 east, which line is about 1.5 miles by river above the next higher lock and dam proposed by the Board of Engineers' report (i. e., Lock No. 4 and Dam No. 2 at the foot of Treat's Island.)

Third. That there shall be conveyed to the United States free of cost a strip of land at least 150 feet wide across the north end of this dam, to be so located, between it and the tow path of the present Illinois and Michigan Canal, as to connext the present mid river above to the same below in the manner approximately indicated on the accompanying blue prints; the right of the United States to enter upon and use such strip of land for the construction and maintenance of a boat lock, its necessary approaches, and for other purposes of navigation, if it so desires, without liability for damages resulting in any way from its operation in connection with construction or maintenance of said lock and appurtenant works to be duly guaranteed.

If these conditions are complied with, in the opinion of the Chief of Engineers, U. S. Army, concurred in by this department, the work proposed is in general harmony with the work of improvement recommended by the Board of Engineers appointed under authority of the River and Harbor Act of June 13, 1902 (32 Stat. L., 331, 364), in its report dated August 26, 1905, printed as House Document No. 263 59th Congress, first session.

Inasmuch, however, as Congress has not as yet authorized the improvement of this river, this department does not deem

it expedient to take further and definite action in the matter of approving the plans. Letter, June 7,

Very respectfully,

ROBERT SHAW OLIVER,
Assistant Secretary of War.

Mr. Charles A. Munroe,
The Rookery, Chicago, Illinois.

43 Defendant avers that afterwards, to-wit, on or about the 15th day of December, 1906, it acquired the interest of said Monroe and his associates in and to the lands hereinabove mentioned, for the purpose of constructing a water power that in February, 1907, Mr. Isham Randolph, Chairman of the Internal Improvement Commission of Illinois, a commission appointed by the Governor of the State of Illinons under an Act of the legislature of that State "to investigate the various problems associated with a projected deep waterway from Lake Michigan to the Gulf of Mexico," made an application to the Secretary of War in relation to the construction of defendant's proposed dam, and a hearing was had thereon before the Secretary of War on the 23rd day of February, 1907; that at such hearing there were present Brigadier-General Alexander Mackenzie, Chief of Engineers, U. S. Army; Mr. Isham Randolph, representing the State of Illinois; Hon. H. M. Snapp, Mr. J. W. Woermann, and Mr. Charles A. Munroe representing the Economy Light and Power Company; and that upon such hearing the following proceedings were had:

Proceedings hearing before Secretary War on Feb. 23,

Secretary Taft: Gentlemen, as I understand this application, it is to prevent me from granting a permit to any person on the Desplaines River to build a dam for water power purposes, on the ground that the State is interested in supervising that matter itself. Is that about the size of it?

Mr. Randolph: Before proceeding I will present you a letter from the Governor of Illinois.

The position of the State, as I understand it, is this. I am appearing in this matter at the present time for the State, because as I understand it the Sanitary District has no interest in the present application whatever. The work of the Sanitary District, however, has made possible the development of very, very important water power on the Desplaines
44 and Illinois Rivers. Prior to the completion of that work the water powers on the Desplaines River were inconsequential. They amounted to but little. The water power on the Illinois River was somewhat better. There was one de-

velopment at Marseilles. But the opening of the Sanitary District naturally has turned into those rivers a permanent volume of water which makes the development of the water powers possible on quite a valuable scale.

The interest of the State in this is to see that this asset is developed to the fullest extent, and that it shall be so developed as not to interfere with the creation of a waterway such as the State hopes to see put through. The Desplaines River rises in Wisconsin and crosses the State line into Illinois about six miles east of the west shore of Lake Michigan. It flows in a southerly and westerly direction for about 86 miles until it unites with the Kankakee River, and the two rivers form the Illinois River.

The resources of the State in coal, as you know, are very large, but they are being tremendously depleted by the constant demand upon them, and it seems to be the part of wisdom on the part of the State and its authorities to conserve all the natural resources which are available within its territory.

Therefore the last legislature authorized the Governor to appoint a board to be known as the Board of Internal Improvement of the State of Illinois, to consider all the questions affecting the development of the resources of the State, particularly its water ways and its water power. The idea of the Governor and this board is that no water power should be developed in such a way as to hinder the development of the waterway, or to militate against the highest development of all the water power that can be created by this new source of power flowing into the State from Lake Michigan; and for that reason the Governor has asked me to attend this meeting and to look out for the interests of the State in the case.

Secretary Taft: Your contention is then, Mr. Randolph, that the present application would not only interfere with your plans for water power, but would also interfere with the navigation of the stream, as that navigation may be anticipated by improvement.

Mr. Randolph: That is not my contention, Mr. Secretary, because I have never had an opportunity of seeing the plans of these applicants.

Mr. Munroe: They are on file in this department.

Mr. Randolph: I have asked for them several times, but have never seen them. They may or they may not be in accordance with a proper development of waterways. If you will remember, the report of the Board of Engineers, who reported upon the deep waterway from Lockport to St. Louis states that they did not, in their consideration take up any

discussion of the water power. I will read from their report a question which covers the grounds. This I quote from page 12 of the report of the 'Board of Officers of the Corps of Engineers, U. S. Army,' upon the 14 foot waterway from Lockport to the mouth of the Illinois River (Document No. 263, 59th Congress, 1st Session) transmitted to you on the 12th day of December, 1905.

Proceedi hearin before Secreta War o Feb. 1

'The plan submitted is not designed to develop water power but there will probably be no difficulty in modifying it so as to conform to such development if those who are to benefit thereby will co-operate with the Government. They should pay the cost of dams and damages from flowage, which is no more than they would be compelled to do if the Government made no improvement.'

I am not saying that the plan proposed is, or is not, an inteference with an adequate waterway, or with the best development of water power, because I never had any chance to study the plan.

The board with which I am connected, has made a study of this whole question, and it finds that it is ossible, under conditions of proper conservation, to develop in the valley at least 173,000 horse power, which you must recognize as an exceedingly valuable asset for the State, if properly de-
46 veloped; and what we ask is that the work should be done systematically so that one work will not militate against the development of the other.

Mr. Snapp: Mr. Secretary, may I say a few words?

Secretary Taft: Yes, sir.

Mr. Snapp: Mr. Secretary, it has been said by Mr. Randolph that he appears here for the State, but I notice in the correspondence that has led up to this hearing that the original proposition proceeds from the Sanitary District of Chicago, and that their letter which has resulted in this pro is of the greatest importance that no vested rights should beceeding, addressed to the Governor of the State, says that, 'It is of the greatest importance that no vested nights should become intrenched in this valley, which would hamper the waterway and the highest interest of the State.'

So that, as a matter of fact, this proceeding, whatever it may be called, was initiated by the Sanitary District of Chicago.

I am interested in this matter in this way. The Sanitary channel terminates at Joliet, my native town. The Desplaines River, where this water power may be developed, lies almost wholly within my county. Like everyone else in that section of the country, I am vitally interested in two propositions:

ings of ing the ary of n 3, 1907.

First, the construction of the navigable waterway, 14 feet deep, from Chicago to St. Louis, and incidentlly, in connection therewith, the highest possible development of water power incidentally created thereby. To properly consider these questions which have been brought before you, two important matters must be kept in mind: First, the rights of the Government in this case, and necessarily connected therewith, the rights of individuals. In other words, if the general government has no right, either to this property, or to the water power developed thereby, there can properly be no determination of this matter by any of the officers of the Government.

Now, as a matter of fact, all the property interest in the Desplaines Valley belongs to private parties. There is absolutely no public ownership of any land in the Desplaines
47 Valley. The stream is not a navigable stream. In low water the entire flow of the Desplaines river would come probably, through a six-inch pipe. It falls down hill, falling 100 feet in less than thirty miles. Neither the flow of the water nor the contour of the land makes the stream navigable, and it has been so held.

Secretary Taft: You say the Desplaines River is not a navigable stream?

Mr. Snapp: It is not a navigable stream, either in law or in fact. It could not be navigated in low water, in the natural condition of the river, by a birch bark canoe.

Secretary Taft: How do we get any jurisdiction of it, General Mackenzie?

Mr. Snapp: Let me answer, Mr. Secretary, as a lawyer. You have absolutely none, and I was going to bring to the attention of the Secretary.

Secretary Taft: Why do you come here for a permit, then?

Mr. Snapp: Let me explain that. We did not come for any permit. My interest in this, as a citizen, is for the best development of these interests. The people who owned this property at the mouth of the river and sought to develop this power went before the Board of Local Supervisors of our county for certain authority. I being most interested in the development of this waterway, took pains to see to it that they were refused that authority until an assurance could be given me and the Board of Supervisors by their plans—which I sought to have passed upon by the War Department—that the development of power under their plans would not interfere in any way with the development of the waterway. Therefore I compelled them by local pressure to submit the matter to General Mackenzie, not for the purpose of asking for permis-

sion to do this work, but for the purpose of satisfying myself and my people that the work contemplated would not, in the event that Congress authorized the waterway, interfere with it in the least, or make it more expensive to the Govern-
48 ment. Is not that practically what we sought, general?

General Mackenzie: Yes, that is practically. We were a little puzzled. Speaking of the Desplaines river in its natural condition it would not be interfered with, but at that time Congress had caused a survey to be made for a 14-foot channel in the Desplaines river, and that put the river on a little different basis—that is, if the Government sought to carry out the 14-foot plan.

Secretary Taft: As a matter of fact, it is not now navigable?

General Mackenzie: It is not now navigable.

Secretary Taft: And if they sank a 14-foot channel in the river and affected private interests, they would have to buy them, would they not?

General Mackenzie: Yes. As Mr. Snapp says, these plans were brought here to the War Department. They were looked over and compared, and the War Department wrote a letter stating that if they satisfied certain conditions they would be in accord with the plans proposed by the Board of Engineers for the 14-foot project. I have a copy of the letter.

Secretary Taft: That is all they said:

General Mackenzie: That is all, sir. As they say, there is no application for this before the Department. No application has ever been made, and as Mr. Snapp said, it was simply that we went over the plans, and at their request this letter was written, to show that if these plans did satisfy certain conditions they would be in accordance with the report of that board, and the plan presented by that board.

Secretary Taft: But you are not seeking to exercise any authority over an existing navigable stream?

General Mackenzie: No, sir.

Secretary Taft: Or to grant a permit so as to protect the interests of the United States in the stream?

General Mackenzie: No, sir.

Secretary Taft: Suppose they were to go ahead with-
49 out coming here at all; you could not go into court, or could not by an order of this department, prevent them from doing anything, could you?

General Mackenzie: I do not think we could. Of course, under all the conditions, so far as they have gone, possibly we would call the attention of the Department of Justice to

ngs of
g
the
ary of
n
3, 1907.

the matter, simply to have them consider it as a legal proposition.

Secretary Taft. Where would the Department of Justice get any power?

General Mackenzie: Only from the general law, that in case of any violation of any law for the protection of navigable streams—

Secretary Taft: Yes, but the Desplaines river is not a navigable stream, is it?

General Mackenzie: It is not to-day, sir.

Secretary Taft: And it could not become so except by a declaration of Congress, and actual work done on it?

General Mackenzie: That is it, exactly.

Secretary Taft: Then where do I get any power to deal with it at all?

General Mackenzie: I do not know that there is any, Mr. Secretary.

Secretary Taft: Mr. Randolph, where do you find I get any power?

Mr. Randolph: Mr. Secretary, the Desplaines river was meandered by the United States Government as far as Romeo—

Secretary Taft: Was what?

Mr. Randolph: Was meandered.

Secretary Taft: That was for a survey, was it not? By "meandered" you mean "surveyed"?

Mr. Randolph: I mean surveyed, and the metes and bounds of the stream were established.

Secretary Taft: They did not fix any harbor lines, did they, on that stream?

General Mackenzie: No, sir.

Mr. Randolph: Of course I am stating this not as of my own knowledge, because I have no personal knowledge of it. That fact, and the fact that the stream was not conveyed along with other lands, still leaves the bed of the stream vested in the United States. That is something for the lawyers, however, and not for me.

Secretary Taft: Would we own the bed of the stream?

General Mackenzie: No, sir, the state would have it.

Secretary Taft: I think so.

Mr. Snapp. If you will pardon me, Mr. Secretary, neither of you is right. It is what is called a meandered stream, for the purpose of survey only, and of ascertaining the quantity of the lands with their improvements in a section or a quarter section. It has been decided time and again by the Supreme

Court of Illinois and by the United States Supreme Court, that on meandered streams the owner of the property takes to the thread of the stream. It has been decided, Mr. Randolph, time and again, in suits in which you have been a witness in the Sanitary District, and for which you have contended that that is the law of the land.

Mr. Randolph: Not that I contended, for I don't know anything about the law.

Mr. Snapp: The Sanitary District so contended, and they had judgment after judgment entered in our courts, which were sustained by the Supreme Court of the United States. That has always been the law. This property belongs to private owners. There is absolutely no public ownership or interest in it. I say this, because I was for quite a while an attorney for the Sanitary District of Chicago, and attorney for the State of Illinois against the Sanitary District, in matters involving all these questions, and I know that what I say is true, that it is the established law of Illinois, sustained by the Supreme Court of the United States, that on meandered streams, navigable, or unnavigable, the abutting property owner takes to the thread of the stream.

Mr. Randolph: Is it not a fact that as attorney for the Illinois and Michigan Canal you contended that they owned the stream up to a certain point above the E. J. & E. Bridge?

Mr. Snapp: No, I contended in one case, because of
51 their riparian ownership of the bank of the canal, they did own a certain portion to the middle of the stream, but as the riparian owner only.

Secretary Taft: Do you represent the State of Illinois alone, or is there anyone else who has an interest?

Mr. Randolph: The Sanitary District has no interest in the present contention, that I can see. It is beyond the reach of any improvements which they propose to make.

Secretary Taft: I am about ready to dispose of this matter.

Mr. Snapp: Will you let me add one word further, Mr. Secretary?

Secretary Taft: Certainly.

Mr. Snapp: As I have said, my interest was to have an assurance that what they undertook to do here in the construction of water power would not interfere with the proper construction of the waterway. Plans were made and submitted to General Mackenzie, not for the purpose securing any permit, but as I said at the time, for the purpose of my personal information, that I might know, as the representa-

ings of ing the ary of on 3, 1907.

tive of that District urging this waterway that they were not to do something that would jeopardize or embarass that. That was all that was sought by me, and that was all that was undertaken by the War Department. It resulted in plans being submitted and an opinion expressed that if the construction were pursued on the lines indicated by the plan it would not in any way embarrass the construction of the proposed waterway along the same line. That is all we sought, and that is all we obtained. That is all anybody wants.

General Mackenzie: In confirmation of that, in a letter dated June 7, 1906, addressed to Mr. Munroe at that time, after reciting certain conditions that must be satisfied by the plant, it is stated:

"If these conditions are complied with, in the opinion of the Chief of Engineers, U. S. Army, concurred in by this Department, the work proposed is in general harmony with the work of improvement recommended by the Board of Engineers
52 appointed under authority of the River and Harbor Act of June 13, 1902, in its report dated August 26th, 1905, printed as House Document No. 263, 59th Congress, 1st Session.

"Inasmuch, however, as Congress has not as yet authorized the improvement of this river, this Department does not deem it expedient to take further and definite action in the matter of approving the plans."

Decision of the Secretary of War.

Secretary Taft: There are two answers to the contention of the State of Illinois in this matter. The application, if I understand it—and it is rather informal than otherwise—is for this Department to take no official action which may interfere with the state control of the water power, which may be developed in the Desplaines river under a proposed improvement by the construction of a 14-foot waterway; and also to take no action which may interfere with the waterway as a waterway.

There are two answers to that. The Department is not going to take any action, and has not taken any action of any sort. The advisory step, taken at the instance of Mr. Snapp or the persons who intended to put some sort of water power construction in the Desplaines river, was extra-official, and really was beyond the authority of the Chief Engineer, except as he was accommodating and was ready to express an opinion, in the interest of explanation.

The truth is that the Desplaines river not being a navigable stream, no permit was necessary to put any obstruction into

it which the War Department could prevent. But even if it had been a navigable stream, and even if the application had been made, and properly made to this Department to say whether this would interfere with navigation, if the Department concluded that it would not interfere with navigation then it is not within the power of the Department to withhold its expressing such an opinion and granting such a permit, so far as the United States is concerned, for the purpose of aiding the state in controlling the water power. If the
53 state has any control over the water power, which it may exercise, in conflict with the claimed rights of the riparian owner, then it must exercise it itself, through its own legislation and through its own executive officers.

Proceedin hearing before Secreta War or Feb. 2

All the United States does, assuming it to be a navigable stream, is merely to protect the navigation of the stream. With reference to the water power it has no function except in respect to water power which it itself creates by its own investment, in property that it itself owns; and then of course it may say how that water power shall be used. But with respect to the water power on a navigable stream, which may be exercised without interference with the use of the river for navigation purposes, that is controlled by the laws of the state. It is controlled by the riparian ownership and by the common law, as it governs those rights. Therefore, I do not see, with reference to this matter, that this Department has any function whatever to perform, or which it can perform. It has merely offered a friendly suggestion that with reference to a possible improvement of the river, which has not been authorized, and which until it is authorized cannot be regarded, as giving any right to this Government to interfere in the use of the stream, the proposed action by the private owners here would not be in conflict with such a plan. That is an expression of an opinion with reference to existing plans, and not with respect to existing conditions.

Therefore, what General Mackenzie has done out of the kindness of his heart does not commit this Department to any assertion of authority in the matter, and certainly does not carry us to the necessity of retracing our steps and saying that they shall not go on with this, when we had not any power to interfere at all.

It is not that we approve this; it is not that we disapprove it. It is that we have nothing whatever to do with it. That is the truth of it.

If the state wishes to control the matter of the water power, then it is for the legislature, through which it can ex-

lings of
ing
the
tary of
on
23, 1907.

press that view, in so far as it may constitutionally affect it by legislation.

54 General Mackenzie: That is virtually what was told the Governor, Mr. Secretary, and this is the result of one of our endorsements.

Secretary Taft: All right, I think that disposes of it."

That thereafter, and relying upon the attitude of the United States through the course of a hundred years, and the reports of its engineers, and relying upon the correspondence passing between the War Department and the said Charles A. Munroe, and upon the decision of the Secretary of War upon the application of said Isham Randolph, this defendant began the actual construction of its dam, which is sought to be restrained in this case, and has expended large sums in and about the same and has incurred liabilities for other large sums, and defendant avers that the present action of the United States as to the navigability of said stream is inequitable and unjust and that it ought not now to be permitted to harass and annoy this defendant by claiming a public highway therein.

Defendant further avers that on December 30, 1907, the Attorney General of Illinois filed an information in the nature of a bill in equity against this defendant in the Circuit Court of Grundy County, Illinois, and obtained a preliminary injunction restraining defendant from proceeding further with the work. That said bill claimed, among other things, (1) that the title to the bed of the Desplaines river at the site of the dam was in the State of Illinois and (2) that the river was a navigable stream; that after a full hearing, the trial court on June 27, 1908, found the issues for the defendant and entered a decree dismissing the bill for want of equity. An appeal was taken to the Supreme Court of Illinois, and that Court on October 26, 1909, affirmed the decree and held that the title to the land on which defendant's dam was being constructed was in the

55 defendant, and that the said Desplaines river was not a navigable stream in law or in fact. And this defendant avers that said action, in so far as it involved the character of the Desplaines River, and the title of this defendant to the land and river bed within the meander line of said Desplaines river was a proceeding in rem., and that the decree of the Circuit Court of Grundy County, affirmed by the Supreme Court of the State of Illinois, in so far as it passed upon the question of the character of the Desplaines river and de-

fendant's title to said land, is a judgment in rem., and is binding upon the world, so long as it remains unreversed. Answer, Feb. 28,

Complainant admits the adoption by the Legislature of the State of Illinois of the Act of May 29, 1889, entitled, "An Act to create sanitary districts and to remove obstructions in the Desplaines and Illinois Rivers," and for the provisions of said Act refers to Laws of Illinois of 1889, pages 126, et seq., where said Act in full and at length appears.

But defendant avers that the purpose of said Act, and it has been so held by the Supreme Court of the State of Illinois, was drainage and sanitation and not the creation of a navigable channel. Defendant admits that pursuant to the provisions of the Act of May 29, 1889, the Sanitary District of Chicago constructed a channel connecting the Chicago River with the said Desplaines River; admits that upon the completion of such Sanitary District Channel, and prior to the commencement of the construction by this defendant of its said dam in the Desplaines River, to-wit, in the year 1900, said Sanitary District of Chicago, pursuant to said Act, did divert through its said channel from Lake Michigan into said Desplaines River, water to the amount of about 300,000 cubic
56 feet per minute; and that continually since the opening of said Sanitary District Channel, there has been diverted from Lake Michigan through said channel into said Desplaines River, at a point above that at which this defendant has commenced the construction of its said dam, a quantity of water amounting to about 300,000 cubic feet per minute; admits that said Sanitary District Channel is and has been since the opening of said channel in 1900 navigable water, but denies that said Sanitary District Channel is navigable waters of the United States or that it is subject to the jurisdiction and control of the Federal Government.

Defendant avers that it was provided in and by said act that whenever the General Government, after the water should have been turned into said Sanitary District Channel should improve the Desplaines and Illinois Rivers for navigation to connect with said Sanitary District Channel, the general government should have full control over the Sanitary District Channel for navigation purposes, but not to interfere with its control for sanitary or drainage purposes; but defendant avers that the general government has not improved the Desplaines and Illinois Rivers for navigation, or otherwise, and has no control over said Sanitary District Channel for navigation purposes, or otherwise.

Defendant avers that the sole and only purpose of the or-

er, filed
b. 28, 1910.

ganization of said Sanitary District and the construction of said Sanitary District Channel was drainage and sanitation and not navigation, and that although a navigable channel was constructed, navigation was in no sense the purpose, or one of the purposes, of the organization of such District, and the construction of said channel, and whenever the use of said channel for navigation should interfere with its use for drainage and sanitation, navigation must give way to the extent that it interferes with drainage and sanitation.

57 And defendant avers that said Sanitary District Channel was constructed by taxes levied upon the inhabitants of said Sanitary District, and that said Sanitary District Trustees hold said channel in trust for drainage and sanitary purposes, and that neither said Sanitary Trustees nor the State of Illinois nor the complainant in this case has authority to divert said channel from such use.

Defendant admits that in connection with the construction of said Sanitary District Channel said State of Illinois has caused the quantity of water flowing through said Desplaines River, below the point at which it connects with said channel, to be largely increased; but denies that said portion of said river has been continuously, or at any time, since the opening of said channel, or now is, water navigable in fact, or a part of the navigable waters of the United States, or subject to the jurisdiction or control of the Federal Government; denies that since the quantity of water flowing through said portion of said Desplaines River has been thus artificially increased, the only substantial obstructions to the navigability of said river are certain rapids between the portion of said river known as the Upper Basin, that is, the portion of said river in which it follows the channel of the Illinois and Michigan Canal, and the portion of said river known as Lake Joliet, and certain other rapids at Treat's Island and Dresden Heights in said river. And denies that, with the exception of the difficulties arising on account of said rapids, said river has been since the opening of said Sanitary District Channel, or now is, capable of being navigated for purposes of commerce. It admits that the difficulties arising on account of such rapids are capable of being overcome through the improvement of said river by locks, canals and dams; but defendant avers that such difficulties can only be so overcome, by the con-

58 struction of such locks, canals and dams as would entirely change the character of said river and create a navigable stream where one does not now exist, and defendant avers that the construction of said Sanitary District Channel, and the

turning into said Desplaines River has not and cannot destroy the rights of this defendant, and its predecessors in title as riparian owners along said stream. Answer, Feb. 24,

Defendant denies that in connection with, and as a result of, the construction of said Sanitary District Channel and the diversion of said water from Lake Michigan, the said Sanitary District of Chicago has largely increased the navigability of the said Desplaines River, or that continuously since the opening of said canal there has been, or now is, in said portion of said Desplaines River, below the point at which it connects with said canal, a body of water navigable in fact, or which, by virtue of its connection with other navigable waters, is to be deemed a part of the navigable waters of the United States, or subject to the jurisdiction and control of said United States; and denies that the control over said body of water exists in the United States in the exercise of its power to regulate commerce; and defendant avers that down to the time of said diversion of said water from Lake Michigan into said Desplaines River, no right or power of control ever existed in the United States over the said Desplaines River, or the waters thereof; and denies that by reason of said diversion of water from Lake Michigan into said Desplaines River, or on any other account, the said United States ever acquired any right or power of control therein.

Defendant admits that by Section 9 of the River and Harbor Appropriation of March 3, 1899, Chapter 425, it is provided that it shall not be lawful to construct or commence

the construction of any bridge, dam, dyke, or causeway
59 over or in any port, roadstead, haven, harbor, canal, navigable river or other navigable waters of the United

States until the consent of Congress to the building of such structures shall have been obtained, and until the plans for the same shall have been submitted to and approved by the Chief of Engineers and by the Secretary of War and that such structures may be built under the authority of the legislature of a state across rivers and other waterways the navigable portions of which lie wholly within the limits of a single state, provided the location and plans thereof are submitted to and approved by the Chief of Engineers and by the Secretary of War before construction is commenced. But defendant avers that said Desplaines River is not a port, roadstead, haven, harbor, canal, navigable river, or other navigable water of the United States, and defendant alleges on information and belief that many bridges and dams have been built, con-

er. filed
28, 1910.

structed and maintained over, in and across the said Desplaines River since the passage of said act, without the consent of Congress to the building of such structures, and without the submission of plans to, or the approval of the same by, the Chief of Engineers or the Secretary of War, and without authority of the Legislature of the State of Illinois. Defendant avers that the purpose of said act was to protect existing commerce, and that there is no commerce on said Desplaines River to protect, and that said act does not apply to said stream.

Defendant admits that in the year 1907, it commenced the construction of its said dam in said Desplaines River, and has already constructed a portion thereof, and that it has never obtained the consent of Congress to the building of said dam, and that the location and plans for construction of said dam, have not been approved by the Chief of Engineers or by the Secretary of War, except as hereinabove stated; but it denies that the same were required by said Act; admits that it
60 asserts and maintains that said Desplaines River is not a navigable river or a navigable water of the United States, and that the authority and permission provided by said Act of March 3, 1899, is not required for the construction of said dam; admits that it has refused, and still refuses, to remove the portion of said dam already constructed, and admits that it will complete the construction of said dam unless prevented by injunction of this court. Denies that the portion of said dam already constructed is a structure erected in violation of the provisions of said Act of March 3, 1899, or that if the construction of said dam is completed by said defendant, said structure will be a permanent, or any, obstruction in said river, or that it will irreparably injure and damage, or injure and damage to any extent, the rights and property of the United States.

Defendant denies that an adequate remedy in the premises can only be obtained in a court of equity, but avers that if the United States have any property rights in the lands and river bed within said meandor lines, such rights may be enforced as promptly, effectively and completely in a court of law as in a court of equity.

Defendant denies that any of the allegations of said bill not herein well and sufficiently answered unto, traversed and avoided or denied are true.

Defendant denies that the complainant is entitled to the relief prayed for in said bill, or to any part thereof, and de-

fendant prays the same advantage of this answer as if it had pleaded or demurred to said bill of complaint, and it prays to be hence dismissed with its reasonable costs in this behalf, most wrongfully sustained. Answer, Feb. 28,

61 And afterwards to-wit: on the eleventh day of April, 1910, came the complainant in said entitled cause by the United States Attorney for the Northern District of Illinois and filed in the Clerk's office of said Court its certain Replication, in words and figures following to-wit: Replicati filed A 1910.

62 IN THE CIRCUIT COURT OF THE UNITED STATES OF AMERICA

For the Northern District of Illinois,

Eastern Division.

United States of America
v.
Economy Light and Power Company. } No. 29776.

The replication of the United States of America complainant herein, to the answer of the Economy Light and Power Company, defendant herein.

This repliant, saving and reserving to itself now and at all times hereafter all and all manner of advantage of exception which may be had and taken to the manifold insufficiencies of the said answer, for replication thereunto says that it will aver, maintain, and prove its bill of complaint to be true, certain, and sufficient in law to be answered unto, and that the said answer of the said defendant is uncertain, untrue, and insufficient to be replied unto by this repliant, without this: that any other matter or thing whatsoever in the said answer contained, material or effectual in the law to be replied unto, and not herein and hereby well and sufficiently

cation, 1 Apr. 11, 0.

replied unto, confessed and avoided, traversed or denied, is true, all which matters and things this repliant is and will be ready to aver, maintain, and prove, as this honorable court shall direct, and humbly prays, as in and by its said bill it has already prayed.

EDWIN W. SIMS,
United States Attorney, Solicitor for Complainant.

(Endorsed) Filed Apr. 11, 1910. H. S. Stoddard, Clerk.

of 25, 1917.

63 And on to-wit: the twenty-fifth day of May, 1917, in the record of proceedings in said entitled cause, before the Hon. Kenesaw M. Landis, District Judge, appears the following entry to-wit:

United States of America,
vs.
Economy Light and Power Company. } 29776.

Now comes the defendant and moves the Court for leave to amend its answer to the bill of complaint herein to conform to the evidence and to the arguments heretofore made upon the hearing of said cause, in accordance with draft of such proposed amendment now submitted to the Court, and said motion is hereby granted, and said defendant is given leave to file said amendment instanter, which is done, and it is further ordered that the replication of the complainant heretofore filed herein stand as and for its replication to said answer as amended.

KENESAW M. LANDIS,
Judge.

64 And on to-wit: the twenty-fifth day of May, 1917, came the defendant in said entitled cause by its solicitors, and by leave of court, first had and obtained, filed in the clerk's office of said court its certain Amendment to Answer, in words and figures following to-wit.

65 AMENDMENT TO ANSWER.

Amendment to answer filed [illegible] 1917.

In the District Court of the United States

For the Eastern Division of the

Northern District of Illinois.

United States of America
—*vs*—
Economy Light and Power Company } In Chancery. No. 29776.

Now comes the defendant, the Economy Light and Power Company, by its socilitors and moves the Court for leave to amend its answer to the bill of complaint herein to conform to the evidence and to the arguments heretofore made upon the hearing of said cause as follows:

By inserting, after the sentence, "Defendant avers that the purpose of said Act was to protect existing commerce and that there is no commerce on said Desplaines river to protect and that said Act does not apply to said stream," the following:

"And the defendant says that the Desplaines River is not in fact, capable of navigation for purposes of useful commerce, and that neither Section 8, Article 1 of the Constitution of the United States, nor the Act of Congress of March 3, 1899, or any other Act of Congress, is applicable to such stream.

And further defendant says that there is not, and has not been within the memory of mankind, any commerce upon said Desplaines River, and that the Congress of the United States has no power under the Constitution, to control or regulate the use of said river.

66 And defendant further answering says that if said Act of Congress of March 3, 1899, or any of the Acts of Congress mentioned in said bill of complaint or relied upon by the complainant should be held to establish the character of said Desplaines River as navigable, then said Acts, and each of them, are, and is, unconstitutional, notwithstanding the Ordinance of 1878, or any of the Acts of Congress for the government of the territories.

This defendant further answering denies that the Act of March 3, 1899, or any other Act of Congress, applies to said Desplaines River, and also further insists that if any of said Acts are held to apply to said river, the same are null and void

dment answer, May 25, 7.

under the provision of the Fifth Amendment to the Constitution of the United States, forbidding the taking of property without due process of law and the taking of private property for public use without just compensation."

SCOTT, BANCROFT, MARTIN & STEPHENS,
ISHAM, LINCOLN & BEALE,
Solicitors for Defendant.

(Endorsed) Filed May 25, 1917, T. C. MacMillan, Clerk.

of 25, 1917.

67 And on the same day to-wit: the twenty-fifth day of May, 1917, in the record of proceedings in said entitled cause before the Hon. Kenesaw M. Landis, District Judge, appears the following entry to-wit:

United States of America,
vs.
Economy Light and Power Company. } 29776.

Upon motion, it is ordered by the court that leave be and the same is hereby granted the respective parties hereto, to fil their abstract of proofs and books of maps as of December 4, 1912.

randum pinion, Nov. 7,

68 And on to-wit: the seventh day of November, 1916, there was filed in the clerk's office of said court in said entitled cause a certain Memorandum of Opinion in words and figures following to-wit:

MEMO. FOR OPINION.

United States
vs.
Economy Light & Power Company }

Bill to enjoin defendant from constructing dam across Desplaines River brought under statute authorizing Attorney-General to so proceed when navigable water of U. S. is obstructed without permit of War Department. Question: "Is river navigable stream within meaning of statute"? Navigable waters of U. S. defined by Supreme Court in Montello case, 87-439. ****

Test is whether river was used or was susceptible of being

used in its ordinary condition as highway of commerce for trade and travel in customary mode and of trade and travel by water. Inquiry is as to the time when actual navigability is averred, that is to say, when it is claimed stream was actually navigated or was actually susceptible of such use by the customary modes of trade or travel at that time. This results from early acts of Congress after adoption of constitution perpetually dedicating as highways of commerce rivers, etc., then impressed with that character.

Memora... of op... filed ... 1916.

U. S. claims (among other uses) actual navigation from early fur trading days down to end of first quarter of last century. Proof of actual specific use by customary mode of trade and travel by water, that is, by kind of craft then used for that purpose on rivers of U. S. throughout this period appears. Controversy has really been as to extent rather than to the fact of such use. This evidence taken with existence of portage from Chicago River to Desplaines during time mentioned a large collection of historical documents, contemporaneous maps and governmental records and reports forbids conclusion river was not subjected to such use for trade and travel down to and subsequent to enactments of original (?) legislation referred to. From this, follows river shown by evidence to be navigable water of U. S. when bill filed and at present time.

No evidence of actual navigation within the memory of living man, therefore no present interference with navigation by placing obstruction in stream. Query: Does act authorize injunction? Question would be serious in absence of actual present injury were it not that legislation enacted at time of general public interest in internal navigation development and improvement and government activity looking to that end. Act considered with its predecessor exhibits intention of Congress to then assume and exercise control over
69 whole subject matter and specifically to prevent thenceforward the placing of further obstructions in navigable waterways unless permitted so to do under the terms and conditions prescribed by governmental department given authority and charged with responsibility of its exercise.

Judgment of State Supreme Court against navigability in Illinois vs. present defendant obviously rendered on record vitally differing in the facts from record here as to actual use of stream for trade and travel by customary mode at time of use. Therefore, that judgment not persuasive, it appearing from court's opinion to have been based on the absence of evi-

5
1

ndum
nion,
Nov. 7.

dence from that record as to such use which evidence is present here.

Claims of government that injunction should issue because of riparian ownership theory untenable—absence of proof of ownership. Also claim of right to injunction because river is now actually navigable within meaning of Montello doctrine untenable, because present volume of water due to artificial cause.

Delay in deciding this cause not source of pride to this court. Due to several things, but in the main responsibility is in the court.

Order finding Desplaines River navigable water of U. S. within meaning of Act of Congress, that Attorney General authorized to bring bill; that construction of dam would be obstruction of such navigable stream without permit of War Dept., and that injunction issue as prayed.

(Endorsed) Filed Nov. 7, 1916, T. C. MacMillan, Clerk.

, 1917.

70 And on to-wit: the twenty-fifth day of May, 1917, in the record of proceedings in said entitled cause, before the Hon. Kenesaw M. Landis, District Judge, appears the following entry to-wit:

71 IN THE DISTRICT COURT OF THE UNITED STATES

For the Northern District of Illinois,

76 ASSIGNMENT OF ERRORS.

Assignment of errors, July 14,

United States of America,
Northern District of Illinois, } ss.
Eastern Division.

IN THE DISTRICT COURT OF THE UNITED STATES

For the Eastern Division of the

Northern District of Illinois.

United States of America,
—*vs*—
Economy Light & Power Company. } In Chancery No. 29,776.

The Economy Light and Power Company, defendant in the above entitled cause, says that in the record and proceedings therein, and in the order or decree entered therein on the 25th day of May, 1917, manifest error has occurred to the prejudice of said defendant, and it assigns for error the following:

1. That the said District Court erred in said decree in overruling each and every of the grounds of demurrer set forth in defendant's answer to the bill of complaint herein.

2. That the said court erred in said decree in finding that the equities are with the complainant.

3. That the said court erred in said decree in holding that the structure described in said bill of complaint as being constructed by said defendant in said Des Plaines River is a
77 structure erected in violations of the provisions of Section 9 of the Act of March 3, 1899.

4. That the said court erred in said decree in enjoining the defendant, its officers, agents, representatives, grantees and assigns, and all persons acting for it or under its authority, or under authority of any grant or conveyance from it, from placing any further obstruction in that portion of the Des Plaines River where said dam was being constructed by said defendant, as set forth in said bill, and from doing any other work in connection with the erection or construction of said dam mentioned in said bill of complaint.

5. That the said court erred in said decree in ordering the said defendant to remove the portion of said dam which has been constructed by it, as described in said bill.

ment of
, filed
14, 1917.

6. That the said court erred in said decree in ordering that the costs of said suit be taxed against the defendant.

7. That the said court erred in not finding for the defendant upon the ground that the Des Plaines River is not, in fact, capable of navigation for purposes of useful commerce, and that neither Section 8, Article I, of the Constitution of the United States, nor the Act of Congress of March 3, 1899, or any other Act of Congress, is applicable to said stream.

8. That the said court erred in not finding for the defendant upon the ground that there is not, and has not been, within the memory of mankind, any commerce upon the Des Plaines River, and that the Congress of the United States has no power under the Constitution to control or regulate the use of said river.

78 9. That the said court erred in not finding for the defendant upon the ground that if said Act of Congress of March 3, 1899, or any other of the Acts of Congress mentioned in said bill of complaint, or relied upon by the complainant, should be held to establish the character of said Des Plaines River as navigable, then said Acts, and each of them, are and is unconstitutional, notwithstanding the Ordinance of 1787, or any of the Acts of Congress for the government for the Northwest Territory.

10. That the said court erred in not finding for defendant upon the ground that if the Act of March 3, 1899, or any other Act of Congress mentioned in said bill of complaint, or relied upon by complainant, applies to the Des Plaines River, said Acts are null and void under the provisions of the Fifth Amendment to the Constitution of the United States, forbidding the taking of property without due process of law and the taking of private property for public uses without just compensation.

11. That said court erred in not finding for the defendant upon the ground that the Des Plaines River is not now a navigable stream.

12. That said court erred in not finding for the defendant upon the ground that the Des Plaines River was not a navigable stream in a state of nature.

79 13. That said court erred in not finding for the defendant upon the ground that the United States is estopped from now claiming or contending that the Des Plaines River is a navigable stream.

14. That the said court erred in not finding for the defendant upon the ground that the judgment and decision of the Circuit Court of Grundy County, Illinois, and of the Su-

preme Court of Illinois affirming said judgment, entered in the case of People of the State of Illinois against the Economy Light and Power Company, was a judgment in rem establishing the character of the Des Plaines River as a nonnavigable stream in a state of nature.

Assignment of errors, July 14,

15. That the said court erred in not finding for the defendant upon the ground that the judgment and decision of the Circuit Court of Grundy County, Illinois, and of the Supreme Court of Illinois affirming said judgment, entered in the case of People of the State of Illinois against the Economy Light and Power Company, was a judgment in rem establishing the character of the said Des Plaines River as a nonnavigable stream, notwithstanding the additional flow of water turned into said stream from the Sanitary District Channel.

16. That said court erred in not finding for the defendant upon the ground that the said Des Plaines River is not navigable water of the United States.

And by reason of such errors, defendant prays that said order and decree of May 25, 1917, be reversed and re-
80 manded with directions to said District Court to enter a decree in favor of defendant.

United States of America,
vs.
Economy Light & Power Co. } 29776.

On motion of Scott, Bancroft, Martin & Stephens, solicitors and counsel for defendant, Economy Light & Power Company,

It is ordered that an appeal to the United States Circuit Court of Appeals, for the Seventh Circuit, from the order and decree heretofore filed and entered herein on, to-wit, the 25th day of May, 1917, be, and the same hereby is, allowed upon the giving of a bond in the sum of $1,000.00 within twenty days to be approved by clerk District Court conditioned according to law, and that a transcript of the record, testimony, exhibits, stipulations and all proceedings herein (excepting the book of maps) and the original of said book of maps, be forthwith transmitted to the United States Circuit Court of Appeals for the Seventh Circuit.

It is further ordered that the bond herein above provided for shall act as a supersedeas bond, and also as a bond for costs and damages on appeal.

Dated this 14 day of July, 1917.

KENESAW M. LANDIS,
Judge.

83 And on to-wit: the twentieth day of July, 1917, there was filed in the clerk's office of said court, a certain Bond on Appeal in words and figures following to-wit:

84 BOND ON APPEAL.

Bond on appeal, July 20,

United States of America
Northern District of Illinois } ss.
Eastern Division

IN THE DISTRICT COURT OF THE UNITED STATES

For the Eastern Division of the

Northern District of Illinois.

United States of America,
vs.
Economy Light and Power Company. } In Chancery. No. 29,776.

Bond on Appeal.

Know All Men By These Presents: That Economy Light and Power Company, a corporation, as Principal and National Surety Company as Surety, are held and firmly bound unto the United States of America in the full and just sum of One Thousand Dollars, to be paid to the said United States of America, to which payment well and truly to be made we bind ourselves, our executors, administrators and successors, jointly and severally, firmly by these presents.

Sealed with our seals and dated this 16th day of July, in the year of our Lord, One Thousand Nine Hundred and Seventeen.

Whereas, lately at a session of the District Court of the United States, for the Eastern Division of the Northern District of Illinois, in a suit pending in said court between the United States of America, complainant, and Economy Light and Power Company, defendant, a decree was entered on, to-
85 wit, the 25th day of May, 1917, in favor of the complainant and against the defendant, Economy Light and Power Company; and,

Whereas, the defendant has obtained from said court an order allowing an appeal to the United States Circuit Court of Appeals for the Seventh Circuit to reverse said decree, and a citation directed to the said United States of America is about to be issued, citing and admonishing the said United States of America to be and appear at the United States Circuit Court of Appeals for the Seventh Circuit, to be holden at Chicago, Illinois;

on
al, filed
20, 1917.

Now, Therefore, The Condition Of The Above Obligation is such that if the said defendant, Economy Light and Power Company shall prosecute its said appeal to effect and shall answer all damages and costs that may be awarded against it, if it fail to make its plea good, then the above obligation is to be void; otherwise, to remain in full force.

86 PRAECIPE FOR RECORD.

United States of America,
Northern District of Illinois, } ss.
Eastern Division.

IN THE DISTRICT COURT OF THE UNITED STATES

For the Eastern Division of the

Northern District of Illinois.

United States of America,
vs.
Economy Light and Power Company. } No. 29776.

Praecipe for Record.

To the Clerk of Said Court:

The clerk will please prepare and authenticate a transcript of the record in the above entitled cause on appeal to the

Praecipe for transcript of record, etc. Aug. 6, 1917.

United States Circuit Court of Appeals for the 7th Circuit, and include therein the following:

1. Bill of Complaint, filed December 14, 1909.
2. Answer of defendant, filed Feburary 28, 1910.
3. Replication of complainant to defendant's answer, filed April 11, 1910.
4. Order allowing amendment to answer, entered May 25, 1917.
5. Amendment to answer, filed May 25, 1917.
6. Proofs of complainant and defendant, filed May 25, 1917, nunc pro tunc as of December 4, 1912.
7. Orders entered July 3, 1917, that proofs received in evidence upon hearing of the case, and not appearing in printed abstracts of proofs, and defendant's Exhibit 1, 2, 3, and 4, admitted in evidence on the 20th day of December, 1915, be filed nunc pro tunc, as of December 20, 1915.
8. Proofs and Exhibits filed July 3, 1917, nunc pro tunc, as of December 20, 1915, pursuant to order last above mentioned.

87 9. Opinion of Judge Landis, filed Nov. 28, 1916.

10. Petition for appeal, filed July 14, 1917.
11. Order allowing appeal and ordering citation to issue, entered July 14, 1917.
12. Assignment of Errors, filed with petition for appeal, July 14, 1917.
13. Appeal bond, filed and approved July 20, 1917.
14. Pursuant to order of July 14, 1917, allowing appeal you will also transmit to the clerk of the United States Circuit Court of Appeals for the 7th Circuit the original book of Maps, filed May 25, 1917, nunc pro tunc as of December 4, 1912.

SCOTT, BANCROFT, MARTIN & STEPHENS,

VOLUME IV OF PROOFS.

(Endorsed) Filed July 3, 1917, Nunc pro tunc as of December 20, 1915. T. C. MacMillan, Clerk.

s from 90 MATTERS INTRODUCED UPON THE HEARING AND NOT APPEARING IN THE PRINTED RECORD.

Introduced on behalf of Complainants.

Excerpts from book entitled, "A View of the Lead Mines of Missouri, including some observations on the Mineralogy, Geology, Geography, Antiquities, Soil, Climate, Population and productions of Missouri and Arkansas, and other sections of the western country. Accompanied by three engravings. By Henry R. Schoolcraft, Corresponding Member of the Ly-

ceum of Natural History of New York, New York. Published by Charles Wiley and Company, No. 3 Wall Street, 1819." Excerpts from book.

"The River Plein, the main head fork of Illinois, approaches so near the head of Chicago River, which enters Lake Michigan at Fort Dearborn, that a communication exists in high water. I conversed with a trader last summer at St. Louis, who had come through in the spring, and afterwards saw his boat lying at the wharf. It carried from 4 to 6 tons, and was built skiff-fashion, with a flat bottom. He represented the undertaking as easy of execution, not requiring an artificial cut of more than 2 miles, and this through an alluvial soil." (p. 41)

"The Illinois is also a stream affording a great length of navigation, and lands of superior quality, and has a natural connection with the great north western lakes, by which boats may, at certain seasons, uninterruptedly pass from Lake Superior, and the Lake of the Woods." (p. 161)

"The Illinois is navigable 300 miles, and when the communication between it and Lake Michigan—between the Mississippi, and Lake Superior, and the Lake of the Woods—between the Missouri and the Columbia—between the Yellowstone and the Multnomah, shall be effected, communica-
91 tions not only pointed out, but almost completed by nature, what a chain of connected navigation shall we behold! and by looking upon the map, we shall find St. Louis the focus where all these streams are discharged, the point where all this vast commerce must centre, and where the wealth, and the refinements flowing from these prolific sources, must preeminently crown her the queen of the west." (p. 243)

At the request of counsel for defendant the counsel for complainant also read the following from the same book:

"A man who merely rides through a country, cannot be expected to publish much valuable information concerning it. The inquiry of a moment, the surmises of ingenuity, and the probability of things, can never atone for sound statistical information, practical remarks, and acknowledged facts. It is necessary to enter into details, before we can arrive at a general result—to establish small facts in order to render larger ones certain—to view in detached bodies, as well as collectively, and indeed before we can pretend to decide on the character of a country to collect, compare, and contrast all its advantages and all its disadvantages; and this cannot be done in a moment. A man may have a glimpse, and not a view—he may see, and yet not understand—he may believe, and yet be mistaken. It is from these facts, and

pts from
X.

knowing how deep first impressions, however erroneous, sink, that I have been induced to hint at the superficial accounts of preceding tourists; and however exceptionable the remark may be in a general sense, it applies forcibly in a particular one. I allude to some works on the western country now generally read at the eastward—to some who are even referred to as text books—to labours of mercenary pamphleteers, as catchpenny printers, where we are served up with surmises instead of facts, with bloated descriptions instead of simple accounts; and the authors of which, in many instances, know not the countries they describe, and have neither admired the beauties, or shrunk at the deformities, which they picture." (p. 52.)

"Copy of Instructions for Deputy Surveyors, Received With Letter From Edward Tiffin, North West of the Ohio, Dated July 26, 1815."

"General Instructions":

"The courses of all navigable rivers, which may bound or pass through your district must be accurately surveyed and their width taken at those points where they may be intersected by township or sectional lines; also the distance
92 of those points from the sectional corners and from the commencement of any course where you are meandering the River, you will likewise not fail to make special notice of all streams of water which fall in your way with their width and course from whence they appears to come or run." (p. 8)

"In meandering Rivers you will take the bearings according to the true meridian of the River and note the distance on any course when the River intersects the sectional lines, and the calculations of the contents of the fractions are to be made by the tables of Difference of Latitude and Departure, and returned on your plats; but the quantity of contents of the whole section only are to be put down; in all the other sections, and each of them is to be accounted one mile square or 640 acres, unless your closing lines deviate very much from 80 chains, in which case you will be careful to put down their true length on your plats." (Par. 7, p. 6)

"Life and Writings of DeWitt Clinton," by William W. Campbell, Published at New York by Baker and Scribner, in 1849.

"We visited the Adams, a brig of 150 tons and four guns, belonging to the United States, commanded by Commodore Brevoort, who appears to be a worthy officer. This is the only vessel we have on the lakes, and she is employed in transporting military stores. She can make a voyage to Fort Dear-

born, upwards of 1000 miles, on Lake Michigan, and return, in two months. The British have two armed vessels on this lake, one pierced for sixteen, and the other for twelve guns, and a fort to the south-west of Black Rock, called Fort Erie, and garrisoned by a Lieutenant and twenty men. Excerpts book.

"Commodore Brevoort says that vessels drawing seven feet water, can at some seasons go from Fort Dearborn to Chaquagy (Chicago) up a creek of that name, and to the
93 Illinois River, whose waters in freshets meet, and so down the Mississippi; he thinks he can effect it in his brig, which draws but six feet when lightened. A brig of 150 tons, sailing from Black Rock to Hudson, would seem incredible." (p. 140)

INTRODUCED BY DEFENDANT.

Letter. Nov. 29,

Letter of J. W. Woermann, C. E. Civil and Hydraulic Engineer, assistant engineer, United States Army, St. Louis, Missouri, November 29, 1911.

"Dear Sir:—

You will probably recall that during my testimony in the Economy case I offered to look up the original computations on which were based the velocities given in the table on page 41 of House Document No. 263, 59th Congress, 1st Session.

"I expected to take this up promptly, but my regular duties prevented me from doing so. Recently I have gone over the Miscellaneous computations relating to the Ernst Report but I have been unable to find any data which would throw any light on the subject except that the computation for the additional depth required through Joliet was made subsequent to the computation of velocities during high water.

"After considering the matter more carefully I have come to the conclusion that the values given in the published table represent the velocities in the unimproved channel and
94 not after the river has been deepened.

"Please see that this statement is added to the record and oblige,

Yours very truly,
J. W. WOERMANN."

"An Act to Create Sanitary Districts and to Remove Obstructions in the Desplaines and Illinois Rivers: Sections 23 of Act t Sanit Distri

Section 7. "The board of trustees of any sanitary district organized under this act shall have power to provide for the drainage of such district by laying out, establishing, con-

ns 7 and
f "An
to create
tary
ricts."

structing and maintaining one or more main channels, drains, ditches and outlets for carrying off and disposing of the drainage (including the sewage) of such district, together with such adjuncts and additions thereto as may be necessary or proper to cause such channels or outlets to accomplish the end for which they are designed in a satisfactory manner; also to make and establish docks adjacent to any navigable channel made under the provisions hereof for drainage purposes, and to lease, manage and control such docks, and also to control and dispose of any water-power which may be incidentally created in the construction and use of said channels or outlets, but in no case shall said board have any power to control water after it passes beyond its channel, waterways, races or structures into river or natural waterway or
95 channel, or water-power or docks, situated on such river or natural waterway or channel; Provided, however, nothing in this act shall be construed to abridge or prevent the State from hereafter requiring a portion of the funds derived from such water power, dockage or wharfage to be paid into the State Treasury to be used for State purposes. Such channels or outlets may extend outside the territory included within such sanitary district, and the rights and powers of said board of trustees over the portion of such channel or outlet lying outside of such district shall be the same as those vested in said board over that portion of such channels or outlets within the said district."

Section 23: * * * "And the Canal Commissioners, if they shall find at any time that an additional supply of water has been added to either of said rivers, by any drainage district or districts, to maintain a depth of not less than six feet from any dam owned by the State to and into the first lock of the Illinois and Michigan Canal at La Salle, without the aid of any such dam, at low water, then it shall be the duty of said Canal Commissioners to cause such dam or dams to be removed. This act shall not be construed to authorize the injury or destruction of existing water-power rights."

96 "A Narrative of the Captivity and Adventures of John Tanner, (U. S. Interpreter at the Sault De Ste. Marie) During Thirty Years Residence Among the Indians in the Interior of North America. Prepared for the Press by Edwin James, M. D., Editor of an Account of Major Long's Expedition from Pittsburgh to the Rocky Mountains. New York: G. & C. & H. Carvill, 108 Broadway, 1830."

"In an attempt to aid this unfortunate individual in ad-

dressing his countrymen, it seemed desirable to give his narrative, as nearly as possible, in his own words and with his own manner. The narrator himself is not without a share of that kind of eloquence which we meet with among the Indians. 'A Narra... the C... and A... tures ... Tanne...

(Page 4)

"From Hopkinsville I returned to the house of my step-mother, where I made my preparations to go to the Lake of the Woods. Part of my relatives, who had accompanied me from beyond the Mississippi, had returned to their own homes; but my brother and his wife stayed to travel with me. From my brother Edward's house, near New Madrid, I went again to Jackson, where I was taken sick. My stock of money had now increased, through the voluntary donations of those friendly and charitable people among whom I had passed, to give hundred dollars, and, this being all in silver, would, my brother thought, be the means of exposing me to danger, and bringing me into difficulty, should I travel by myself; he, therefore refused to leave me.

97 "From Jackson we went together to St. Louis where we saw Gov. Clark, who had already given much assistance to my brother in his journeys in search of me. He received us with great kindness, and offered us whatever assistance we might think necessary in accomplishing the object I now had in view, which was, to bring my family from the Indian country. My brother wished to accompany me, and to take a considerable number of men, to aid, if it should be necessary, in taking my children from the Indians; but I went one day to Gov. Clark by myself, and told him he must not listen to my brother, who knew little of the country I was going to visit, or of what was needful to my success in the attempt to bring out my family. In truth, I did not wish my brother, or any other white man, to accompany me, as I knew he could not submit to all the hardships of the journey, and live as I should be compelled to live, in an Indian Lodge, all winter. Furthermore, I was aware that he would be rather an incumbrance than any help to me. Gov. Clark wished to send me to the Lake of the Woods by way of the Upper Mississippi; but I was not willing to go that way, on account of the Sioux, through whose country I must pass. He gave me a Mackinac boat, large enough to carry sixty men, with a sufficient crew, three barrels of flour, two of hard bread, guns, tents, axes, &c., &c. Having prevailed on my brother to return, I set off. The current of the Mississippi, below the Missouri, soon convinced me that my large and heavy boat

rative of captivity Adven- of John er."

was not well adapted to the nature of my undertaking, and at Portage De Sioux I left it. From this place I pro-
98 ceeded in a small canoe, with two men, to the head of the Illinois River, thence to Chicago." (Page 253)

"As the winter came on, I went to Red River to hunt buffaloe, and make dry meat, and early in the spring I started to come to the states. From my first wife I had parted ten years before the time I now speak of; but the urgency of the Indians, and, in part, the necessity of my situation, had compelled me to take another. By this woman I had three children; those by my former wife were not at present in the village. My wife refusing to accompany me, I took the three children and started without her. At Rainy Lake she overtook me, and agreed to accompany me to Mackinac.

"On my way down I was assisted by the North West Company. At Drummond's Island I was disappointed of large presents given me when on my way to the Lake of the Woods, but which, as I did not then wish to take, were promised me on my return. The commanding officer who had shown me so much kindness, had been relieved by another, of a very different character, one who seemed to find no satisfaction in doing anything for any person connected with the Indians. This man refused to see me, or afford me any assistance. By the kindness, however, of Mr. Ermatinger, of the Sault De St. Marie, I was enabled to reach Mackinac.

"Col. Boyd, the Indian agent at that time at Mackinac, called me to him, and wished to hire me a striker in his smith's shop; but not liking the employment, I did not wish to remain. He gave me one hundred pounds of flour, the same quantity of pork, some whiskey, tobacco, &c. There were two vessels about to sail for Chikago, but neither of them
99 would take me as a passenger, though I had money enough, and was willing to pay them. As I had no other alternative, I was compelled to purchase from the Indians a poor and old bark canoe, for which I gave sixty dollars, and I engaged three Frenchmen to accompany me; but Col. B.—— would not permit them to go. He gave me, however, a letter to Dr. Wolcott, who was now Indian agent at Chicago, and I started with only one man to assist me.

"At the Ottawwaw settlement of Waw-gun-nuk-kiz-ze I stopped for a short time, and finding that my canoe was too frail and leaky to perform the voyage, I purchased another, a new one, for which I gave eighty dollars. Several of my acquaintances among the Ottawwaws determined to accompany me, and started accordingly, eight men in one canoe, and six

in another, with some women. They went on with me until we arrived within one or two days' journey of Chikago, when meeting other Indians, with discouraging accounts of the state of the water in the Illinois, they left me and went back. My wife returned with them." (Page 255)

"A Narr... the C... and A... tures ... Tanner."

1073 "When I arrived in Chikago, I was sick of a fever, and my provisions being exhausted, I was in great distress. I went to Dr. Wolcott to present him the letter from Col. Boyd, the Indian agent at Mackinac, but he would not receive it, nor take any notice of me. He knew well who I was, as he had seen me when I passed through Chikago before, and I could not tell why he refused me assistance. I had my tent set up at a little distance from his house, near a wild rice swamp, and for several days, though I was so much more unwell that I was scarce able to sit up five minutes at a time, I subsisted my children by shooting the black birds as they came and settled on the rice. When I was again able, with the aid of two sticks, to crawl to the house of Dr. Wolcott, I went to represent to him that my children were in danger of perishing of hunger; but he drove me harshly away. When I left his door I shed some tears, which it was not common for me to do; but I was rendered womanish by my sickness. Three or four times I fainted, and lay long by the road side, on the way from his house to my tent. But my sufferings, and those of my children, were shortly afterwards relieved by a Frenchman, who had been to carry some boats across the Portage. His wife was an Ojibbeway woman, and commonly accompanied him when he went to take any boats across. Though his horses were now much worn out with the long journey from which he had returned, he agreed to take me and my canoe sixty miles, and if his horses could hold out, the whole one hundred and twenty, which was, at the present stage of water, the length of the Portage, for which I agreed to pay him agreeable to his demand, which I thought very moderate. He lent me, also, a young horse to ride, as I was far too

1074 weak to think of walking, and he thought I could ride on horseback much more comfortably than in the cart with the canoe. Before we arrived at the end of the sixty miles, he was taken sick, and as there was now a

tive of
ptivity
ven-
f John
."

little water in the river, I concluded to put my canoe in, and try to descend in it.

His young horse, the night after I gave it up to him, was stolen by the Po-ta-wato-mies. He was seized with the bloody flux, but as he had a young man with him, I rendered him what assistance I could in starting, and let him go back. My Frenchman had deserted me soon after I left Chikago, and I had now no person to assist me except an old Indian, called Gos-so-kwaw-waw, (the smoker). We put the canoe in the water, but we could not get into it ourselves, only sometimes the children were put in, and we took them down, one walking at the bow, the other at the stern of the canoe. We had proceeded no more than three miles, when I found that this method was likely to prove so laborious and slow, that I thought best to engage a Po-ta-wato-mie, whom I met
1075 there, and who agreed for a blanket and a pair of leggins, to take my baggage and my children on his horses to the mouth of the An-num-mum-ne-Se-be, or Yellow Ochre River, a distance of sixty miles. The An-num-mun-ne comes from towards the Mississippi, and below it there is always, in the Illinois, water enough for canoes. I felt somewhat afraid to trust the Po-ta-wato-mie with my children, and the baggage, which contained some valuable property, but old Gos-so-kwaw-waw was of opinion that he would prove honest. When he put the children on the horses, he said, 'In three days I shall be at the mouth of the An-num-mun-ne River, and shall wait for you there.'

Without any farther words, we parted, and the old Smoker and myself continued our laborious and difficult route along the bed of the Illinois. Most of the country, on both sides the route, from Chikago to the Yellow Ochre River, are prairie, in which horses and carts can be driven without any difficulty. On our arrival at the place appointed, we found the Po-ta-wato-mie there, and all safe.

We now embarked every thing together in the canoe, and went down to Fort Clark, which is on a narrow neck of land, between two lakes, and is thence called by the Indians Ka-gah-gum-ming.

1076 At Cape Guirardeau, where I left my canoe, and where I remained but a very short time, I saw some of the gentlemen of Major Long's party, then on their return from the Rocky Mountains. This was in the fall of the year 1820, and was about one year after my first arrival on the Ohio in 1819. From the time of my capture by Manito-o-geezhik and Gish-kaw-ko, just thirty years had elapsed, before I started in the spring of 1819, from the Lake of the Woods. So that it must have been in the spring of the year 1789, that I was taken prisoner. I am now forty-seven years old.

"A Narrat... the Cap... and Adv... tures of ... Tanner."

In the spring of 1822, I started to go again to the north, not finding that I was content among my friends in Kentucky. I went by way of the Grand Prairie, and having given my canoe to my brother, I took horses, and putting my children on them, I came to St. Louis, thence by way of the Illinois, towards Chikago.

The Indian agent for Fort Clark lived at this time at a place called Elk Heart, some distance below. He, as well as most of the people on this route, had been kind, and had shown a disposition to assist me whenever I needed any thing. On this journey I stopped at Elk Heart, at the house of the agent, and though he was not himself at home, I had my horses fed, and was supplied with what refreshment I needed for myself and children, free of expense. On the following day, I met the agent
1077 on his way home from Fort Clark, and told him of the reception I had met at his house in his absence. He was glad to hear of this, and he told me that I should soon come to a bad river to cross; 'but' said he, 'there is a boat now on this side, in which I have just crossed. The man to whom it belongs, lives on the other side. You must use the boat to cross, and then tell him to take it around to the other river, which is beyond his house, and help you to cross that, and I will pay him for his trouble.' We crossed accordingly, but my daughter Martha being now sick, we stopped all day near the house of the man to whom the canoe belonged. I had one very handsome horse, which had been given me by my brother, and which this man said he was determined to have from me. He offered to buy it; but I told him the horse was necessary to my journey, and I could by no means part with it.

ive of
tivity
ren-
John

Still he insisted, and said, unless I would let him have the horse, I should not have his canoe to cross the other river. He cursed and abused me, but all the means he could use, did not induce me to give up the horse. The canoe had been taken around to the river I had to cross, for the use of some other person, and when I was ready to go I started, expecting to find it there. But on my way to the ferry, I met the man on horseback, who said to me, 'I have taken away the canoe, and you cannot cross.' Without regarding this, I went on, and when I arrived, I found the canoe was indeed gone, and that there were no logs, or other materials to make a raft. Fearing to endanger the children, by swimming them across on the
1078 horse's backs, I stood for some time in doubt what to do. At last I recollected, that if he had hid the canoe, as was most probably the case, his track would lead me to it. Then going back to the road, a considerable distance from the river, I found his track coming into it. This I followed, until I found the canoe hid in thick bushes, about a mile below the ferry. Taking it up to the crossing place, I carried my children, and led the horses over; then giving the canoe a push into the stream, I said to it, 'go, and stay where your master hides you.' ''

(Endorsed) United States Circuit Court of Appeals For the Seventh District Economy Light and Power Co. a Corporation, Appellant, vs. United States of America, Appellee. Stipulation. Filed Feb 8—1918 Edward M. Holloway, Clerk

100 Defendant's Exhibits 1, 2, 3, and 4 introduced in evidence March 20, 1915.

101 DEFT'S EX. 2. Defendant's Exhibit 2.

State of Illinois } ss.
Grundy County. }

IN THE CIRCUIT COURT THEREOF

To the March Term, 1908.

To the Honorable the Judges of the Circuit Court of Grundy County, In Chancery Sitting:—

102 William H. Stead, the Attorney General of the State of Illinois, who sues for the People of the said State of Illinois in this behalf, and at the relation of Charles S. Deneen, Governor of the State of Illinois, comes now here, and in the name and by the authority thereof, gives this Honorable Court to understand and be informed, as follows, to wit:

I. That the said People of the State of Illinois, by their said Attorney General, bring this their suit against The Economy Light and Power Company, a corporation, duly organized under the laws of the State of Illinois, and having its principal office and place of business at the City of Chicago, in the County of Cook and State of Illinois.

II. That in the early history of our country a certain territory embracing what is now the States of Ohio, Indiana, Illinois, Michigan and Wisconsin, was claimed to be owned by Virginia, and that afterwards, by certain Acts of the Legislature of Virginia, and by its deed of cession, bearing date the first day of March, A. D. 1784, said territory was conveyed to the United States, and that afterwards, and, to wit, on the 13th day of July, A. D. 1787, the Congress of the United States, then existing under the Articles of Confederation, enacted a certain ordinance entitled, "An Ordinance for the Government of the Territory of the United States Northwest of the River Ohio," and which said Act was and is commonly known as the ordinance of 1787. That among other provisions of said ordinance of 1787, Section 14 thereof contains the following:

103 "It is hereby ordained and declared, by the authority

aforesaid, that the following articles shall be considered as articles of compact, between the original States and the people and States in the said territory, and forever remain unalterable, unless by common consent, to wit, * * * Article 4. * * The navigable waters leading into the Mississippi and St. Lawrence, and the carrying places between the same, shall be common highways, and forever free, as well to the inhabitants of the said territory as to the citizens of the United States and those of any other States that may be admitted into the Confederacy, without any tax, impost duty therefor."

That afterwards, and on, to wit, the 18th day of May, 1796, said Congress of the United States passed a certain statute entitled, "An Act providing for the sale of the lands of the United States in the territory northwest of the River Ohio and above the mouth of the Kentucky River, and by Section 9 thereof provided as follows:

"Sec. 9. And be it further enacted that all navigable rivers within the territory to be disposed of by virtue of this Act, shall be deemed to be and remain public highways."

That thereafter, and to wit, by a statute duly passed by the Congress of the United States on the 7th day of May, 1800, entitled, "An Act to divide the territory of the United States northwest of the Ohio into two separate Governments," there was divided and set apart from said Northwestern territory a certain portion thereof which embraces all of what is now the State of Indiana and the State of Illinois, and provided the same should constitute a separate territory, to be called the Indiana Territory.

104 That thereafter the Congress of the United States, acting under the constitution of 1789, for the further government of certain portions of the said Northwestern Territory, and on, to wit, the 26th day of March, 1804, duly passed a certain statute entitled, "An Act making provision for the disposal of the public lands in the Indiana Territory, and for other purposes"; and by Section 6 thereof, it was provided that "All the navigable rivers, creeks and waters within the Indiana Territory shall be deemed to be and remain public highways."

That afterwards the Congress of the United States, by its Act of February 3, 1809, entitled "An Act for Dividing the In-

diana Territory into two separate Governments," provided, among other things, that that portion of the said Indiana Territory which now comprises the State of Illinois, for the purposes of temporary government, should constitute a separate territory to be called Illinois; and that among other and further provisions in said Act it is provided: Defendant's Exhibit 2.

"That there shall be established within the said territory a government in all respects similar to that provided by the ordinance of Congress passed on the 13th day of July, 1787, for the government of the territory of the United States, northwest of the River Ohio; and by an Act passed on the 7th day of August, 1789, entitled 'An Act to provide for the Government of the Territory Northwest of the River Ohio'; and the inhabitants thereof, shall be entitled to and enjoy all and singular the rights, privileges and advantages, granted and secured to the people of the Territory of the United States northwest of the River Ohio by said ordinance.

That afterwards, and, on to wit, the 18th of April, 105 1818, the Congress of the United States enacted another statute, entitled "An Act to enable the people of Illinois to form a constitution and State Government, and for the admission of such State into the Union, on an equal footing with the original States," which statute contains the following provision:

"Sec. 4. And be it further enacted * * * Provided, that the same, whenever formed, shall be republican, and not repugnant to the ordinance of the 13th of July, 1787, between the original States and the people and States of the territory northwest of the River Ohio, excepting so much of said articles as relates to the boundaries of the States therein to be formed: * *"

That afterwards the people of the Illinois territory duly adopted the constitution known as the Constitution of 1818, the preamble of which contains the following, to wit:

"The people of the Illinois Territory, having the right of admission into the general government as a member of the Union, consistent with the Constitution of the United States, the Ordinance of Congress of 1787, and the law of Congress, approved April 18, 1818, entitled 'An Act to enable the people of the Illinois Territory to form a Constitution and State government, and for the admission of such State into the Union on an equal footing with the original States, and for other purposes'; in order to establish justice, promote the wel-

nt's
lt 2.

fare and secure the blessing of liberty to themselves and their posterity, do, by their Representatives in convention, ordain and establish the following Constitution or form of government and do mutually agree with each other to form themselves into a free and independent State, by the name of the State of Illinois."

That afterwards, and, to wit, on December 3rd, 1818, the Congress of the United States adopted a certain resolution entitled, "Resolution declaring the admission of the State of Illinois into the Union," which declared, among other
106 things, that the "Constitution and State government, so formed, is republican, and in conformity to the principles of the articles of compact between the original States and the people and States in the territory northwest of the River Ohio, passed on the 13th day of July, 1787. * * *"

III. That the River Desplaines is situated in said territory, and rises in what is now the State of Wisconsin, and flows in a southerly direction into the State of Illinois, and through the Counties of Lake and Cook and between Du Page and Cook Counties therein, and through the County of Will and into Grundy County, in all a distance of about 96 miles.

That the River Kankakee rises in Indiana and flows westerly therefrom into Illinois through Kankakee and Will Counties and into Grundy County therein, where it unites with the Desplaines River, and with the said Desplaines River forms the Illinois River, which last named river flows thence westerly and southwesterly through several counties of Illinois into the Mississippi River. Wherefore and by reason whereof your orators charge the fact to be that the Desplaines River is wholly within the territory originally comprising what was known as the Northwestern Territory, and that the same empties its waters into the Mississippi River, and, by reason of the facts hereinafter set forth, is subject to the provisions of the said Acts of Congress.

107 IV. Your orators further show unto your Honors that it is shown by the history of the explorations and discoveries of the territory in what is now the northern part of Illinois, that at the time of the explorations and discoveries, the Desplaines River was navigable from a point near where is now situated the City of Chicago, in the State of Illinois, to the mouth of said Desplaines River, in what is now Grundy County, Illinois; that by the same history it is shown that the portion of the Desplaines River last above mentioned was used in the early period of the State of Illinois as highway

for commercial purposes; that commerce was carried on over said river and over the Chicago River, located in Cook County, Illinois, and connection therewith made by a short portage between the two rivers near the site of what is now the City of Chicago, Cook County, Illinois, and was in use as the highway of commerce, leading from Lake Michigan and the waters emptying into the St. Lawrence River on the one hand, to the Illinois River and the waters of the Mississippi River on the other hand, thenceforward from the time of said first use up to and at the time when the said ordinance of 1787 and the several acts of Congress were respectively enacted. Defendant's Exhibit 2.

That afterwards the State of Illinois, by and through the Legislature thereof, and in obedience to the several acts of Congress hereinbefore set forth, assumed and took charge of the said Desplaines River, and in the exercise of its con-
108 trol over the said Desplaines River, did by its certain act, entitled, "An Act to authorize the building of a bridge across the Desplaines River," approved and in force February 19, 1839, gave permission for the building of a toll bridge across the Desplaines River, on the northeast quarter of Section number eleven (11), in towship number thirty-nine (39) north, in Range number twelve (12), east of the Third Principal Meridian; and also, by the same act, permission was given to build another bridge across the same river, on the southeast quarter of Section number two (2) in the same Town and Range last above mentioned; and that afterwards the Legislature of the State of Illinois passed a certain law, entitled, "An Act to amend the several laws in relation to the Illinois and Michigan Canal," in force February 26, 1839, which contain. among other provisions, the following, to wit:

"Sec. 2. Sub-section 9. That no stream of water passing through the canal lands shall pass by the sale so as to deprive the State from the use of such water if necessary to supply the canal without charge for the same.

And that Sub-section 11 of said Section 2 of said Act is in the words as follows, to wit:

"Sub-Sec. 11. Lands situated upon streams which have been meandered by the surveys of public lands by the United States should be considered as bounded by the lines of those surveys, and not by the streams."

109 That afterwards the Legislature of the State of Illinois, by its certain laws then passed, entitled, "An Act declar-

ing the Desplaines River a navigable stream," approved and in force February 28th, 1839, provided as follows:

"Sec. 1. Be it enacted by the people of the State of Illinois, represented by the General Assembly, That the Desplaines River from the point where it most nearly connects itself with the Illinois and Michigan Canal to its source within the boundaries of this state, is hereby declared a navigable stream, and shall be deemed and held a public highway, and shall be and remain free, open and unobstructed from said point of connection with said canal to its utmost limit within this state for the passage of all boats and water crafts of every description";

And that afterwards the Legislature of the State of Illinois, by its statute passed and in force March 3, 1845, entitled "An Act to authorize Stephen Forbes to construct a dam across the Desplaines River in Cook County", provided as follows, to wit:

"Sec. 1. Be it enacted by the People of the State of Illinois, represented by the General Assembly, that Stephen Forbes, or his heirs and assigns, be, and they are hereby authorized to construct, build and continue a mill dam across the Desplaines River, on the south west quarter of Section thirty-six (36) in Township No. thirty-nine (39) North of Range twelve (12), east, and on the northeast quarter of Section two (2), Township No. thirty-eight (38) North of Range twelve (12), east, in the County of Cook in this state; provided that this act shall not operate to prevent the state from improving said river by dams, or from using the water in said river for the Illinois and Michigan Canal at any time hereafter, or for any other purpose; provided, that he shall be liable for any damage to any individual in consequence of the erection of such dam."

And that afterwards the Legislature of the State of Illinois, by its certain law, entitled, "An Act authorizing the build-
110 ing of a bridge and road in Township 36 North, Range 10, east, in Will County," approved and in force February 12, 1849, authorized the construction of a bridge over the Desplaines River at Lockport in Will County, Illinois.

That afterwards the Legislature of the State of Illinois, by its certain act, entitled "An Act to create sanitary districts and to remove obstructions in the Des Plaines and Illinois Rivers," approved May 29th, 1889, in force July 1, 1889, among other things provided as follows:

"Sec. 23. If any channel is constructed under the provisions hereof by means of which any of the waters of Lake

PAGES MIS

Michigan shall be caused to pass into the Des Plaines or Illinois Rivers, such channel shall be constructed of sufficient size and capacity to produce and maintain at all times a continuous flow of not less than three hundred thousand cubic feet of water per minute, and to be of a depth of not less than fourteen feet, and a current not exceeding three miles per hour, and if any portion of any such channel shall be cut through a territory with a rocky stratum where such rocky stratum is above a grade sufficient to produce a depth of water from Lake Michigan of not less than eighteen feet, such portion of said channel shall have double the flowing capacity above provided for, and a width of not less than one hundred and sixty feet at the bottom capable of producing a depth of not less than eighteen feet of water. If the population of the district drained into such channel shall at any time exceed one million five hundred thousand, such channel shall be made and kept of such size and in such condition that it will produce and maintain at all times a continuous flow of not less than twenty thousand cubic feet of water per minute for each one hundred thousand of the population of such district, at a current of not more than three miles per hour, and if at any time the general government shall improve the Des Plaines or Illinois rivers, so that the same shall be capable of receiving a flow of six thousand cubic feet of water per minute, or more, from said channel, and shall provide for the payment of all damages which any extra flow above three hundred thousand cubic feet of water per minute from such chan-
111 nel may cause to private property so as to save harmless the said district from all liability therefrom, then such sanitary district shall within one year thereafter, enlarge the entire channel leading into said Desplaines and Illinois Rivers from said district to a sufficient size and capacity to produce and maintain a continuous flow throughout the same of not less than six hundred thousand cubic feet of water per minute with a current of not more than three miles per hour, and such channel shall be constructed upon such grade as to be capable of producing a depth of water not less than eighteen feet throughout said channel, and shall have a width of not less than one hundred and sixty feet at the bottom. In case a channel is constructed in the Des Plaines River as contemplated in this section it shall be carried down the slope between Lockport and Joliet to the pool commonly known as the upper basin, of sufficient width and depth to carry off the water the channel shall bring down from above. The district constructing a channel to carry water from Lake Michigan

NUMBERED

of any amount authorized by this Act may correct, modify and remove obstructions in the Des Plaines and Illinois rivers wherever it shall be necessary so to do to prevent overflow or damage along said river, and shall remove the dams at Henry and Copperas creek in the Illinois River, before any water shall be turned into the said channel.

And the canal commissioners, if they shall find at any time that an additional supply of water has been added to either of said rivers, by any drainage district or districts, to maintain a depth of not less than six feet from any dam owned by the State to and into the first lock of the Illinois and Michigan canal at La Salle, without the aid of any such dam, at low water, then it shall be the duty of said canal commissioners to cause such dam or dams to be removed. This act shall not be construed to authorize the injury or destruction of existing water power rights.

And also in the same Act it is provided:

"Sec. 24. When such channel shall be completed and the water turned therein, to the amount of 300,000 cubic feet of water per minute, the same is hereby declared a navigable stream, and whenever the general government shall improve the Des Plaines and Illinois rivers for navigation, to connect with this channel, said general government shall have full control over the same for navigation purposes, but not to interfere with its control for sanitary drainage purposes."

112 That afterwards the Legislature of the State of Illinois on the 14th day of May, 1903, enacted a certain statute which became in force on the 1st of July, 1903, entitled, "An Act on relation to the sanitary district of Chicago, to enlarge the corporate limits of said district, and to provide for the navigation of the channels created by such district, and to construct dams, water wheels and other works necessary to develop and render available the power arising from the water passing through its channels, and to levy taxes therefor," which said Act contained, among other things, the following provisions, to wit:

"Sec. 3. Said Sanitary District shall permit all water craft navigating or purporting to navigate said Illinois and Michigan Canal, to navigate the water of all said channels of said Sanitary District promptly, without delay and without the payment of any tolls or lockage charges for so navigating in said channels. The rules of the United States Government now in force, regulating navigation on the Chicago River, shall govern navigation on the channels of said Sanitary District of Chicago;

Defendant's Exhibit

Provided, however, that the speed of all vessels while passing through the earth sections shall not exceed eight miles per hour.

"Sec. 8. The said Sanitary District shall, at the expense of said district, in all respects comply with the provisions of the Act of Congress of March 22, 1822, and March 2, 1827, as construed by the courts of last resort of the State of Illinois, and of the United States in relation to the Illinois and Michigan Canal so far as it affects that portion of the Illinois and Michigan Canal vacated or abandoned in the terms of this act."

And your orators show that after the passage of the said statute of May 29th, 1889, a Sanitary District was formed in pursuance thereof, known as the Sanitary District of Chicago, and said Sanitary District of Chicago has con-
113 structed a channel substantially in compliance with the provisions of said statute. That said channel begins at a point of junction with the Chicago River in the City of Chicago and extends southwesterly through the County of Cook into the County of Will, where it connects with and empties its waters into the Desplaines River, and is now and for several years last past has been discharging into said Desplaines River at a point north of Joliet in Will County, a body of water drawn from Lake Michigan through the Chicago River and through said drainage channel, amounting to about 300,000 cubic feet of water per minute, and your orators show that said body of water mingles with the waters of the Desplaines River, and flows thenceforward through the course of the Desplaines River to the mouth of said river, on Section number twenty-five (25) Town number thirty-four (34) North, Range number eight (8) East of the Third (3rd) Principal Meridian in Grundy County.

That afterwards the Legislature of the State of Illinois enacted its certain statute, and the same became in force by approval from and after the 6th day of December, 1907, as follows, to wit:

"A Bill for an Act recognizing the Des Plaines and Illinois Rivers as navigable streams and to prevent obstructions being placed therein, and remove obstructions therein now existing.

Section 1. Be it enacted by the People of the State of Illinois, represented in the General Assembly: That the Des Plaines and Illinois Rivers throughout their courses from and below the water power plant of the main channel of the

Sanitary District of Chicago in the township of Lock-
114 port, at or near Lockport, in the County of Will, are hereby recognized as and are hereby declared to be navigable streams; and it is made the special duty of the Governor and of the Attorney General to prevent the erection of any structure in or across said streams without explicit authority from the General Assembly; and the Governor and Attorney General are hereby authorized and directed to take the necessary legal action or actions to remove all and every obstruction now existing in said rivers that in any wise interferes with the intent and purpose of this Act.

Sec. 2. Whereas an emergency exists: this Act shall be in force and effect from and after its passage."

That the relator, Charles S. Deneen, is the Governnor referred to in said statute, and that he by virtue and reason of said statute and in the direction therein contained, as well as by virtue of his office as Governor, and his constitutional duty to take care that the laws be faithfully executed, has a special interest and responsibility in the matters herein set forth.

Your orators further show that the Des Plaines River has, from the time when said ordinance of 1787 was passed by the Congress of the United States unto the present time, formed in its ordinary condition, and by itself, to the extent of its course, from the point of said portage and connection with the Chicago River in Cook County, Illinois, to its mouth in Grundy County, Illinois, and then forward by uniting with the said Illinois River, a continued highway with water in sufficient volume and of sufficient depth to afford a channel for navigable and commercial purposes.

Wherefore and by reason whereof your orators charge the fact to be that the Desplaines River from near the City
115 of Chicago, in Cook County, Illinois, to the mouth of said river in Grundy County, Illinois, has been from the earliest knowledge of said river until the present time in law and in fact a navigable river, and that the several acts of the Legislature hereinbefore recited show the fact to be that it has been and is the policy of the State of Illinois to hold and maintain said Desplaines River to be a navigable river, and so being a navigable river both in law and in fact, said river is subjected to the provisions of the several acts of Congress hereinbefore set forth, and by reason whereof the said Desplaines River has been and still continues to be a highway of commerce, and as such is preserved for the use of the people of the State of Illinois, and the people of all the states of the United States as a public highway, and has not been alienated

from the rights of the people as a public highway, and that the People of the State of Illinois and of the United States have an easement over said river as a public highway for commerce, and that said river and the bed and waters thereof are permanently impressed and burdened with said easement and with a public right and public use of navigation. Defendant's Exhibit

V. Your orators furthr represent unto your Honors that by an Act of Congress of the United States, approved March 2, 1827, the Congress of the United States granted to the State of Illinois every alternate section in a strip of land ten miles wide along the line of the Illinois and Michigan Canal for the purpose of aiding the opening of a canal to connect the waters of the Illinois River with those of Lake Michigan, and that among the lands thus conveyed by the Congress of the United States to the State of Illinois, in Section number twenty-five (25), in Township number thirty-four (34) North, in 116 Range eight (8), East of the Third (3rd) Principal Meridian, in Grundy County, Illinois. That the Legislature of the State of Illinois, in the exercise of its power and control over said lands, last above described, and other lands received from the Congress of the United States, as above stated, by its certain Act entitled, "An Act to amend the several laws in relation to the Illinois and Michigan Canal," in force February 26, 1839, enacted the following provision, to wit:

"Section 2. Sub-Sec. 11. Lands situated upon streams which have been meandered by the surveys of public lands by the United States shall be considered as bounded by the lines of those surveys and not by the streams."

That the Desplaines River and the Kankakee River unite and form the Illinois River in the southeast quarter of said Section number twenty-five (25) in Township number thirty-four (34) North, in Range number eight (8), East of the Third (3rd) Principal Meridian, in Grundy County aforesaid, and that, by the survey of public lands by the United States said Desplaines River was meandered.

Your orators are informed and believe and upon such information and belief charge the fact to be, that the purchasers from the State of Illinois of lands in said Section twenty-five (25), above described, and other similarly situated lands with reference to the Desplaines River, did not take, and did not claim to take under their several purchases that portion of said lands lying between the meander line of the Desplaines River and the waters of said river; and that said lands between said meander line and the water of said Desplaines

River have never been used by any individual, under any claim of authority or right vested in said purchasers of said lands from the State of Illinois, save and except as
117 claimed by the defendant. Wherefore, and by reason whereof, your orators charge the fact to be that the lands lying between the meander line of the Desplaines River and the waters of said river, in the southeast quarter of said section number twenty-five (25), in Township number thirty-four (34) North, in Range number eight (8), East of the Third (3rd) Principal Meridian, in Grundy County, Illinois, together with the bed of the stream of the said Desplaines River, in said quarter section of land last described above, and other lands similarly situated with reference to the Desplaines River, have not passed by any purchase of adjoining lands from the State of Illinois, and that the same, and each and every part thereof, is owned by the State of Illinois, and held by said State for the use and benefit of the people of the State of Illinois, and of the People of the United States, as a public highway for commerce.

VI. Your orators further state unto your Honors that the Trustees of the Illinois and Michigan Canal executed and delivered to one Chas. E. Boyer, a deed bearing date as of the 22nd day of October, 1860, for certain tracts of land described therein as follows, to wit:

"The south fraction of the northwest quarter, and the north fraction of the southeast quarter, and the north fraction of the northwest quarter, and the south fraction of the southeast quarter of said Section 25, in Township 34 North, of Range 8, East of the Third Principal Meridian, excepting and reserving so much of said tract as is occupied by the
118 canal and its waters, and a strip 90 feet wide on either side of said canal, containing 196.62 acres, more or less, said tract being a portion of the land granted by the United States by the Act of March 21, 1827, and the 28th day of August, 1854, to the State of Illinois, to aid said State in opening a canal to connect the waters of the Illinois River with those of Lake Michigan, and by said State granted to the said Board of Trustees of the Illinois and Michigan Canal for the purposes set forth in said Act of said State of February 21, 1843."

And your orators further state unto your Honors that the legislature of the State of Illinois, by its certain Act approved and in force February 26, 1839, enacted as follows, to-wit:

"Sec. 2. Sub-Sec. 9. That no stream of water passing through canal lands shall pass by the sale so as to deprive

the State from the use of such water if necessary to supply the canal without charge for the same." Defendant's Exhibit

"Sec. 2, Sub-Sec. 11. Lands situated upon streams which have been meandered by the surveys of public lands by the United States shall be considered as bounded by the lines of those surveys and not by the streams."

Wherefore your orators charge that no part of the land in the northwest quarter and in the southeast quarter of said section number twenty-five (25), in Town thirty-four (34) North, in Range eight (8), east of the Third (3rd) Principal Meridian, lying and being situated outside of the meander line of the Desplaines River, were conveyed by said deed to the said Charles E. Boyer, and that the same remain the property of the State of Illinois.

And your orators further state that the claim of the defendant, the Economy Light and Power Company, to said portion of said premises so situated outside of the mean-
119 der lines of the Desplaines River, and in said Section number Twenty-five (25), is based upon mesne conveyances from the said Charles E. Boyer, and the several contracts and leases hereinafter set forth.

VII. That on March 2, 1827, the Congress of the United States passed a certain Act entitled

"An Act to grant a quantity of land to the State of Illinois for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of Lake Michigan," in which, among other things, it was provided as follows:

"That there be, and hereby is, granted to the State of Illinois, for the purpose of aiding the said State in opening a canal to unite the waters of the Illinois River with those of Lake Michigan, a quantity of land equal to one-half of five sections in width, on each side of said canal, and reserving each alternate section to the United States, to be selected by the Commissioner of the Land Office, under the direction of the President of the United States, from one end of said canal to the other; and the said lands shall be subject to the disposal of the legislature of the said State, for the purpose aforesaid, and no other."

That in and by said Act of March 2, 1827, said Congress granted, by implication, the right of way for the construction of said canal through the sections of public lands which were not donated to the State in aid of said canal; and that the said grant of right of way by implication extended to the land necessary to be used for the canal of the width contemplated.

That afterwards such proceedings were had, pursuant to

law and to said statute, that the route and location of said canal were duly surveyed and laid out, and the odd num-
120 bered sections of lands upon the survey of the same as Public Lands by the Surveyor General of the United States bordering said canal and within five miles on each side of said canal, commencing with Township number thirty-two (32) North of Range number one (1), East of the Third (3rd) Principal Meridian, were duly selected, by said Commissioner of the Land Office, under the direction of the President of the United States (except 21 exterior sections, not now involved), the said selections as confirmed included said Section 25, Township 34 North, Range 8, East of the Third Principal Meridian, and Sections 31, 29, 21, 15, 11, all in Township 34, North, Range 9, East of the Third Principal Meridian, and Sections 31, 29, 21, all in Township 35 North, Range 10, East of the Third Principal Meridian, and said Board of Commissioners of the Illinois and Michigan Canal laid out said canal, through said last named sections, and began the construction thereof, and provided for the reservation of a 90-foot strip of land on each side thereof for use as a tow path and as part of the canal throughout the length thereof.

That afterwards, in the years 1847 and 1848, Artemus J. Matthewson, a surveyor and engineer, under the authority and direction of the Canal Trustees herein elsewhere referred to, surveyed and marked the lines of a 90-foot strip on each side of the canal as finally located and constructed from one end thereof to the other, and prepared and filed in the
121 office of said Board of Trustees maps and profiles of said survey, and the said 90-foot strip so laid off and surveyed by said Matthewson on each side of the canal as aforesaid, was reserved from sale by the Canal Commissioners and Canal Trustees in sales of canal lands in said odd numbered sections, and title thereto remains in the State of Illinois; and said strip, together with the lands necessary for right of way through the alternate even numbered sections of land through which said canal was constructed, constitute integral parts of the said canal, and are necessary for its preservation and use, and are, by law, preserved and protected against alienation; and said 90-foot strip was so expressly reserved from sale in said deed by said Trustees of the Illinois and Michigan Canal to said Charles E. Boyer.

122 VIII. Your orators further represent unto your Honors that the Canal Commissioners of the State of Illinois entered into a certain contract, bearing date as of the 2nd day of September, 1904, with one Harold F. Griswold, and

which said contract, as your orators are informed and believe, and upon such information and belief charge the fact to be, was, by the said Harold F. Griswold, assigned, so that by mesne assignments the same was purported to pass to The Economy Light & Power Company, the defendant in this cause, a copy of which said contract is hereto attached and marked Exhibit A, and hereby made a part of this bill.

Defendant's Exhibit

And your orators further state unto your Honors that they are informed and believe, and upon such information and belief charge the fact to be that the said Canal Commissioners entered into a contract of lease with one Harold F. Griswold as of the date of the 2nd day of September, 1904, a copy of which said lease is hereto attached and marked Exhibit B, and hereby made a part of this bill; and which said lease was, as your orators are informed and believe, assigned by the said Harold F. Griswold, so that by mesne assignments the same was purported to pass, to The Economy Light & Power Company.

And your orators further inform the Court that they are informed and believe, and upon such information and belief charge the fact to be, that the Canal Commissioners entered into another certain contract with the said Harold F. Griswold as of the date of the 8th day of August, 1905, a copy of which said contract is hereto attached and marked Ex-
123 hibit C, and hereby made a part of this bill, and which said contract was, as your orators are informed and believe, assigned by the said Harold F. Griswold, so that by mesne assignments the same was purported to pass to The Economy Light & Power Company.

Your orators further state unto your Honors that the Canal Commissioners of the State of Illinois made an application to the Governor of the State of Illinois for his consent to the sale of certain lands, and which said application bears date as of the 11th day of June, 1904, a copy of which said application is hereto attached, marked Exhibit D, and hereby made a part hereof; and that a copy of the approval of said application for said sale by the Governor of the State of Illinois, as of the date of the 14th day of June, 1904, is hereto attached and marked Exhibit E, and hereby made a part of this bill.

And your orators further state unto your Honors that in pursuance of said application for sale, and the approval of said application by the Governor, as aforesaid, there was inserted in the Lockport Phoenix-Advertiser, a newspaper of general circulation, printed and published in the village of Lockport, in the County of Will, and State of Illinois, a cer-

tain notice of said proposed sale, a copy of which said notice, together with the certificate of publication thereof, is hereto attached and marked Exhibit F, and hereby made a part of this bill.

And your orators further state unto your Honors that
124 in and by said notice last above mentioned, the premises therein described were advertised to be sold on the 2nd day of August, 1904, at 10 o'clock in the morning for cash, at the Canal office in Lockport, Will County, in the State of Illinois; and your orators further state that no sale of said premises occurred on the 2nd day of August, 1904, in pursuance of said notice, but that the sale so advertised to be made was adjourned, and never thereafter resumed.

Your orators further represent unto your Honors that after the 2nd day of August, A. D. 1904, and under date of September 2, 1904, the Canal Commissioners of Illinois entered into the agreement and lease hereinbefore mentioned, and marked respectively Exhibits A and B, and that afterwards, and, to wit, under date of November 1, 1904, the Canal Commissioners of the State of Illinois made an application to the Governor of the State of Illinois for his consent to the sale of certain lands in said application described, a copy of which application is hereto attached and marked Exhibit G, and hereby made a part of this bill; and that the approval of said application for sale by the Governor of the State of Illinois was made in writing, a copy of which said approval, bearing date as of the 2nd day of November, 1904, is hereto attached and marked Exhibit H, and hereby made a part of this bill. That in pursuance of said application and approval a notice of sale was inserted in the Lockport Phoenix-Advertiser,
125 a weekly newspaper of general circulation, a copy of which said motion, together with the certificate of publication thereof, is hereto attached and marked Exhibit I, and hereby made a part of this bill.

And your orators further state that in pursuance of said application last above mentioned for the sale of certain lands, and the approval of the Governor thereof, and of the advertisement in the Lockport Phoenix-Advertiser last above mentioned, the said Canal Commissioners, as your orators are informed and believe, and upon such information and belief charge the fact to be, sold, and executed a certain deed to Harold F. Griswold as of the date of the 6th day of January, 1905, a copy of which said deed is hereto attached and marked Exhibit J, and hereby made a part of this bill; and, as your orators are informed and believe, the said Harold F. Griswold

conveyed said premises, so that by mesne conveyances the same were purported to pass to The Economy Light & Power Company, the defendant in this cause. Defendant Exhibit

Your orators further state unto your Honors that they are informed and believe, and upon such information charge the fact to be that the said Canal Commissioners entered into a contract of lease with Harold F. Griswold as of the date of September 2nd, 1904, a copy of which said lease is hereto attached and marked Exhibit K, and hereby made a part of this bill, and which said lease, as your orators are informed and believe, was assigned by the said Griswold, so that by mesne assignments the same were purported to pass to The Economy Light & Power Company, the defendant herein.

And so it is, as your orators are informed and believe, 126 and upon such information and belief charge the fact to be, that the said Economy Light & Power Company, claiming to act by pretended right, authority and virtue of the several deeds, leases and contracts hereinbefore mentioned, claims the right to construct a dam across the Desplaines River and across certain lands adjacent thereto, and across the 90-foot strip of land so used for canal purposes, and immediately adjoining the waterway of the said Illinois and Michigan Canal, and upon the bank or tow path of the said Illinois and Michigan Canal, and so to construct said dam as to flood the lands along the Desplaines River for a distance of several miles, to wit, the distance of ten miles, or thereabouts, above the location of said proposed dam, and which said location of said proposed dam is on the southeast quarter of Section No. 25 in Township No. 34 North, in Range No. 8 East of the Third Principal Meridian, in Grundy County, Illinois, and that in pursuance of said claim of right on its part said Economy Light and Power Company has commenced the construction of a dam across said Desplaines River and across the lands as hereinbefore set forth, but your orators aver that the said several leases, deeds and contracts are ineffectual to confer any right to build or maintain said dam.

Your orators further state unto your Honors that the General Assembly of the State of Illinois has, by its proper resolution, duly passed by the Senate and concurred in by the House of Representatives of said General Assembly on, to wit, the 16th day of October, 1907, a copy of which is hereto attached, marked Exhibit L, and made a part hereof, proposed the building of a deep waterway, commencing at the southern end of the Chicago Drainage Canal and extending

's
2. southwesterly along the line of the Desplaines and Illi-
127 nois rivers, in accordance with plans and specifications formulated by the corps of engineers of the United States Army, under and by direction of a certain Act of the Congress of the United States; and that the proposition so proposed by the legislature of the State of Illinois has been authorized by the said legislature of Illinois to be submitted to a vote of the people of the State of Illinois, authorizing the construction of said deep waterway, and if the same is built, as an incident thereto, locks and dams, with special provisions for navigation, and securing and safe guarding the passage of boats, will necessarily be constructed across said deep waterways in the channel of the Desplaines River at or near the said southeast quarter of Section number 25, in township number 34 north, in range number 8 east of the Third Principal Meridian in Grundy County, Illinois, which said dam will incidentally afford water power of great value, to wit of the value of several millions of dollars to the State of Illinois, and which said water power, so necessarily incidentally created, will be lost to the State of Illinois if the said Economy Light and Power Company, the defendant herein, shall be permitted to construct the dam herein mentioned.

And your orators deny the right and authority of the Trustees of the Illinois and Michigan Canal, or of the Canal Commissioners of the State of Illinois, to convey the lands com-
128 posing the bed of the stream of the Desplaines River, or any part or portion of the lands of said section number 25 last above described, outside of the meander line of the Desplaines River.

And your orators further charge that the ninety foot strip of land along the line of the Illinois and Michigan Canal is necessary for the proper maintenance and use of the Illinois and Michigan Canal and constitutes a necessary integral part of said canal, and being so necessary for the use of the said Illinois and Michigan Canal and its maintenance, and being so an integral part of the said canal, the Trustees of the Illinois and Michigan Canal did not have, and the Canal Commissioners of the State of Illinois had not and does not now have, the right and authority under the law, to convey the same by deed, lease or otherwise. Wherefore, and by reason whereof your orators charge the fact to be that the Economy Light and Power Company, the defendant herein, has not acquired any right, title or interest in and to the bed of the stream of the Desplaines River, or that portion of said Section 25 last above described lying and being outside of the

meander line of the said Des Plaines River, or in and to the 90 foot strip of land lying between the waters of the Illinois and Michigan Canal and the said Desplaines River, and said deeds, leases, contracts and other agreements, in so far as they pertain to the bed of the stream of the Desplaines River, and to the lands lying outside of the meander line, and to
129 the 90 foot strip of land so reserved for the use of the Illinois and Michigan Canal, and so located in the southeast quarter of Section number 25 last above described, are void and of no effect. Defendant's Exhibit

And your orators charge the fact to be that by virtue of the several enactments of the Congress of the United States as hereinbefore set forth, and of the several acts of the Legislature of the State of Illinois as hereinbefore set forth, the bed of the Des Plaines River is owned by the State of Illinois, and that the same has not been conveyed by any deed to anybody whomsoever, and that the lands on said Section No. 25 last above described, and other sections of land along the line of the Des Plaines River, so granted to the State of Illinois by the act of Congress hereinbefore referred to, outside of the meandered line of said stream, to wit, the Des Plaines River, have not been conveyed by the State of Illinois nor by any other person or persons or corporation whomsoever having authority so to convey the same, and that the same remain and are owned by the State of Illinois.

IX. Your orators further state unto your Honors that notwithstanding the rights and interests of the people of the State of Illinois, as hereinbefore set forth, the Economy Light & Power Company, a corporation, claims or pretends to claim to be the owner of the bed of the stream of the Desplaines River and other lands in said southeast quarter of said Section number 25 above mentioned, and other lands for a
130 distance of several miles up the Desplaines River, which are outside of the meander line of the said Desplaines River, and so pretending and claiming to be the owner of said premises has threatened to erect, and has actually begun the erection of a dam across the Desplaines River, and across the 90-foot strip of land so reserved for the use of the Illinois & Michigan Canal, and across other lands outside of the meander line of the Desplaines River, and to connect said dam with the bank or tow path of the Illinois and Michigan Canal, and to so construct said dam as to cause the water to be backed up and to overflow the lands belonging to the State of Illinois, and other lands for a long distance above said pro-

nt's
it 2.

posed dam, to wit, for the distance of ten miles, or thereabouts.

That your Attorney General heretofore, on the 12th day of December, A. D. 1907, caused to be served on said defendant, The Economy Light and Power Company, a certain notice and command in writing, notifying and commanding the said defendant, its officers, agents, servants and representatives, to cease and desist from in any manner infringing upon, trespassing upon or interfering with the said lands owned by the State of Illinois, or in which the State of Illinois or the People of the State of Illinois have an easement for the benefit of the public, located in said Section 25 in Grundy County, Illinois, by the erection of a dam thereon, or otherwise, and to cease and desist from in any way obstructing the Des-
131 plaines River or the Illinois River in said Section or elsewhere, and further notifying and commanding said defendant to remove any and all obstructions that it may have placed upon said premises, whether the same be in the bed of the Desplaines River or otherwise located; which notice and command in writing was served upon said defendant company by personal delivery of the same to John F. Gilchrist, Secretary of said defendant Company, who, on behalf of said defendant company then and there acknowledged service and receipt of the same; a copy of which notice and command, with said written receipt of service, as signed by said secretary, appended, is hereto attached and marked Exhibit M. But now so it is, may it please your Honors, that said defendant has ignored said notice and command and disregarded the same, and since the service and receipt thereof has continued and persisted in the work of constructing said dam at said place in the bed of said river, and has employed about one hundred men, with horses, wagons and machinery in so doing, and unless prevented by the injunction of this Honorable Court, will soon complete the same to the great impairment of said easement of navigation and to the great and irreparable injury of the people of the State of Illinois.

That if the said dam is permitted to be erected by the defendant, it will destroy and interfere with the Desplaines River as a navigable waterway for the use of the People of the State of Illinois, and for all the People of the United
132 States; that it will overflow and destroy the value of the lands and the use of lands belonging to the State of Illinois adjacent to said Desplaines River, and outside of the meander line of said river; that it will destroy the use of the 90-foot strip of land so to be retained for the use and benefit

Defendant's Exhibit 2

of the Illinois and Michigan Canal, and render the same inoperative and of purpresture impaired benefit to said canal; that it will destroy a feeder of the Illinois and Michigan Canal and will constitute a purpresture and that the same will produce and work irreparable loss and damage to the Illinois and Michigan Canal, and to the State of Illinois, and to the rights of the people of the State of Illinois.

133 X. Your orators further show that said agreement Exhibit A, purports to give authority and consent by the Canal Commissioners unto the said Griswold and his assigns, to dam the Desplaines River, to back up water upon a ninety-foot strip and cause the same to be flooded, to excavate in and remove portions of said Kankakee feeder therein mentioned and of the structures therefor, to attach the said proposed dam to the tow path of the canal, to divert water from the Desplaines River, to attach and close up a levee to and along the tow path bank of the said canal, to use the gravel and material the property of the state, to enter upon the canal lands and the canal itself in and about said works, and to raise, change and alter buildings owned by the state and used in connection with said canal; as to each and every of which provisions the same were beyond the power of said Commissioners to grant.

That said consent and permission, purported to be conferred by said instrument, was without limit of time, and of right should be held, in law and in equity, to be without any authority, and to confer no authority, and be against the public policy of the state and in derrogation of the rights and interests of the people, and to be revocable by the state.

The said lease, Exhibit B, purported to convey and demise interests in the said ninety-foot strip within the area described in said lease, to which reference is here made, in that part of the canal called the Kankakee feeder, and pur-

134 ported to give a first right of renewal to the party of the second part therein named, and purported to be made subject to said contract Exhibit A. That each of said instruments purported to contract, on the part of said Canal Commissioners, with said Griswold, his successors and assigns, and by their terms might be assigned, one to one assignee and the other to another and different assignee.

That said contracts were entered into by the parties thereto with the mutual knowledge and understanding that the party of the second part and his assignee thereof intended to make use of the same in erecting said dam and developing water power thereon, and that the same amount to a lease of water

power rights and lands and lots connected therewith. That the said lease and contrast were not nor were either of them entered into upon notice by publication, nor limited to a period of ten years, contrary to the provision of a certain act entitled, "An Act to revise the law in relation to the Illinois and Michigan Canal, and for the improvement of the Illinois and Little Wabash Rivers," approved March 27th, 1874, and acts amendatory thereof, and, in particular, to the provisions of Clause 6 of Section 8 of said statute as amended by the certain act amendatory thereof, approved June 19th, 1891, in force July 1st, 1891; and your orators charge that the same are beyond the power of said Commissioners to enter into, and are null and void.

Your orators further show that treating said instru-
135 ments as leases of water power they are subject to the power of the state, by its lawfully authorized agents, to resume, without compensation to the party of the second part therein named, his successors or assigns, the use of such water power, and are further subject to the power of the state to abandon or destroy the work by the construction of which the water privilege therein purported to be conferred shall have been created, whenever, in the opinion of the Legislature, such work shall cease to be advantageous to the state,—all in accordance with the provisions of said Clause 6 of said Section 8 of said Act approved March 27th, 1874, as amended by said Act approved June 19th, 1891.

Your orators further show that the opinion of the Legislature that such work has ceased to be advantageous to the state was duly expressed by the said statute heretofore cited, approved and in force December 6th, 1907, entitled "An Act recognizing the Desplaines and Illinois Rivers as navigable streams, and to prevent obstructions being placed therein, and remove obstructions therein now existing."

That said contract, Exhibit C, purports to leave to the said Griswold, and his successors and assigns, such right as is now, at the date thereof, under the control of the Canal Commissioners, to divert the waters of the Kankakee River into the Kankakee Feeder, and discharge the same into the Des-
plaines River, and to destroy and reconstruct the dam
136 across the Kankakee River, and to construct at each end of said Kankakee feeder suitable gates for controlling the discharge of the Kankakee River through said feeder, and to enter upon the Kankakee feeder for the purposes therein named.

But your orators show that the said contract was a further

lease for the purpose of enabling the assignee therein to develop and create water power, and was not made in conformity to the provisions of the statute last cited in reference to the Illinois and Michigan Canal; and further show that said Kankakee feeder was an integral part of said canal, and that said agreement was beyond the power of said Commissioners to make. Defendant's Exhibit 2.

But your orators further show that said lease, Exhibit C, contained the following provision, to wit:

"It is herein further stipulated and agreed, and the Canal Commissioners hereby expressly reserve the right to cancel this lease and recover possession of the land, property and rights above demised and referred to, whenever in the judgment of the Canal Commissioners, or other proper officers of the state, at such time having charge of Canal property, they shall deem the interests of the state require it to repossess and use said property for state purposes."

And your orators show that said power of revocation and cancellation may be exercised by the Legislature of the state and that the same was exercised by the Legislature of the state by the enactment of the statute hereinbefore mentioned, which was approved and in force December 6th, 1907, entitled "An Act recognizing the Desplaines and Illinois rivers as navi-
137 gable streams, and to prevent obstructions being placed therein, and remove obstructions therein now existing." And your orators show that the exercise of the powers and privileges and rights purported to be conferred by said lease, Exhibit C, will constitute and create obstructions of the Desplaines River.

That said Deed Exhibit J purports to convey the lands therein described, and in terms to include lands lying and being situated outside of the meander line of the Desplaines River, and purports to be subject to the terms of said flowage contract Exhibit A, and said lease Exhibit B, and to renew the covenants thereof by the certain provision in said deed referring thereto, which recites that the said deed is "subject, however, to the terms, conditions and provisions of the flowage contract and lease made with said Harold F. Griswold, and bearing date September 2, A. D. 1904, which terms, conditions and provisions still remain in full force, and shall be fully kept and performed."

And your orators show that the said lands and lots described in said deed are lands and lots connected with the water power privileges sought and purported to be conferred and created by said contract Exhibit A, and said lease Ex-

hibit B, and that said advertisement thereof did not so designate and describe said properties, and did not limit the same to the term of ten years prescribed by law, and the same are beyond the power of the said Commissioners and are null
138 and void, and are subject to the power in the state to resume the same and to abandon and destroy the work by the construction of which water privileges shall have been created, whenever in the opinion of the Legislature such work shall cease to be advantageous to the state;—and your orators show that the opinion of the Legislature that the same ceased to be advantageous to the state was duly expressed by the said statute approved and in force December 6th, 1907, entitled, "An Act recognizing the Desplaines and Illinois Rivers as navigable streams, and to prevent obstructions being placed therein, and remove obstructions therein now existing."

Your orators further show that said Pole lease, Exhibit K. purported to convey to said Griswold, his successors and assigns, the right to maintain a line of poles along said Canal from the west line of said Section 25, upon which said dam has been located, to Robey street in the city of Joliet, and from the same point in said Section 25 to the west limits of the City of Morris in Grundy County.

And your orators show that the said lease was made upon the same day as said contract and lease Exhibit A and Exhibit B, and was also for the purpose of developing the said water power and transferring and conveying the same as electrical energy by said proposed line of poles, and was subject to all the infirmities heretofore specifically alleged as to said contract and lease Exhibit A and Exhibit B.

And your orators further show that said contracts, deeds and leases were and each of them was entered into on inadequate consideration.

139 Forasmuch therefore, as your orators is without remedy in the premises, except in a court of equity, and to the end that the said Economy Light & Power Company, the defendant in this bill, may be required to make full and direct answer to the same, but not under oath, the answer under oath being hereby waived, and that the said deeds, leases and contracts hereinbefore mentioned and each of them may be set aside and be declared to be beyond the power of the said Canal Commissioners and null and void as to each and every part and in particular as to the bed of the Desplaines River, and as to the 90-foot strip of land hereinbefore described, and as to the lands lying and being situate outside of the

Defendant's Exhibit 2.

meander line of the Desplaines River, and as to the said part of the canal designated as the Kankakee feeder, and that the said Economy Light & Power Company, its officers, agents and servants, and each and all and every of them, shall be restrained by the order and injunction of this Honorable Court from erecting a dam across said Desplaines River and across the premises hereinbefore mentioned, and from causing the waters of the Desplaines River to back up and overflow the lands of the State of Illinois, and to refrain from permitting the obstruction already placed in said Desplaines River to be made and remade therein, and that your orator may have such other and further relief in the premises as equity may require and to your Honors shall seem meet.

May it please your Honor to grant unto your orator the people's writ of injunction to be directed to the Economy
140 Light & Power Company, restraining it and its officers, agents and servants, from erecting a dam across the Desplaines River and across the 90-foot strip of land adjoining the water course of the Illinois and Michigan Canal on the site thereof next to the Desplaines River, and across the lands outside of the meander line of the Desplaines River, and from causing the water of the Desplaines River to be backed up and to overflow the lands belonging to the State of Illinois, and from permitting the obstructions already placed in said Desplaines River and on said 90-foot strip of land and on said lands outside of the meander line of the Desplaines River by the Economy Light and Power Company, all located in and on the southeast quarter of Section No. 25 in Township No. 34 north, in Range No. 8 east of the Third Principal Meridian, in Grundy County, Illinois, to remain therein and thereon, until the further order of this court.

May it please your Honor to grant the writ of summons in chancery directed to the Sheriff of the County of Cook, commanding him that he summon the Economy Light & Power Company to appear before the said court on the first day of the next March Term thereof to be held at the court house in the City of Morris, in the County of Grundy aforesaid, and then and there to answer this bill.

W. H. Stead,
Attorney General.

Walter Reeves,
Merritt Starr,
Special Counsel.

Copy. Let an injunction issue according to the prayer of the bill with permission to the defendant to protect the works and machinery now on the grounds without however extending or increasing the work already done, without bond.

December 30, 1907.

S. C. STOUGH
Judge.

142 EXHIBIT A.

This Agreement, made and entered into this 2nd day of September, A. D. 1904, by and between The Canal Commissioners of the State of Illinois, party of the first part, and Harold F. Griswold, of the City of Evanston, County of Cook and State of Illinois, his successors and assigns, party of the second part, Witnesseth:

Whereas, said party of the second part claims to be a riparian owner along certain streams of water called the Desplaines River and Illinois River, in the Counties of Grundy and Will, in the State of Illinois, and as such riparian owner is about to improve said Desplaines River by the construction of a dam and other works across the mouth of said river in the County of Grundy and State of Illinois, with a crest of such height that the pool formed thereby will be on a level with the waters of Lake Joliet (a portion of said Desplaines River

in Will County, Illinois) and is about to improve said Illinois River by deepening the channel of said river in Section Twenty-five (25), Township Thirty-four (34) North, Range VIII East of the Third P. M., and

Whereas, the State of Illinois is a riparian owner at different points on the Desplaines and Illinois Rivers within the territory covered by this contract, as well as the owner of the hereinafter described parcels of land, under the control of The Canal Commissioners, and which are not connected with water power upon the Illinois and Michigan Canal,
143 which said rapirian rights and said land have never produced a revenue, and said land is now unproductive of revenue, swamp, unfit for cultivation, and partially covered with water, and said lands are so situated that the riparian rights appurtenant thereto cannot be made available by the State to create water power, and

Whereas, said party of the second part is desirous of obtaining the right to use, overflow and damage (in such manner as will not interfere with navigation on the Illinois and Michigan Canal), so much of the said property as may be necessary in the construction of said dam and other works in the improvement of said Desplaines River and in the deepening of the channel of said Illinois River,

Therefore, in consideration of the premises and the sum of Two Thousand Two Hundred Dollars in hand paid by the said party of the second part, the receipt whereof is hereby acknowledged, it is agered as follows:

1st. That said party of the first part consents that said party of the second part shall have the right and authority in so improving the Desplaines River, to construct a dam and other works across the Desplaines or Illinois River at a point near the confluence of the Desplaines and Kankakee Rivers, in the County of Grundy and State of Illinois, with a crest at an elevation of not to exceed minus seventy-three and two-tenths (73.2) Chicago city datum, but in no event
144 shall the back water caused by said dam extend beyond the northerly limits of "Lake Joliet" (said "Lake Joliet" being a wide portion of the Desplaines River about six miles in length and lying south of the City of Joliet in the County of Will and State of Illinois) and further consents that said party of the second part may excavate in and deepen the channel of the Illinois River in Section 25, Township 34 North, Range VIII East of the 3rd P. M.

2nd. That said party of the second part shall have the right and authority to flow the ninety-foot reserve strip of

the Illinois and Michigan Canal in Sections 25 and 26, Township 34, North, Range VIII, Grundy County, Illinois, and in Sections 31, 30, 29 and 20, Township 34 North, Range IX, Will County, Illinois, up to the canal bank; also so much of the north fraction of Section 31, Township 34 North, Range IX East of the 3rd P. M. as lies south of the ninety-foot reserve strip along the towpath side of the Illinois and Michigan Canal, where the same may be overflowed by reason of the construction of said dam and other works with the crest hereinbefore specified, together with the right to flow the water up against the towpath bank of the Illinois and Michigan Canal in said sections Provided the towpath shall be protected and preserved as hereinafter provided.

3rd. That said party of the second part shall have the right to excavate in, and remove so much of the Kankakee Feeder (an abandoned feed of the Illinois and Michigan Canal) lying north of the Desplaines River, and south of the ninety-foot strip in Section 21, Township 34 North, Range IX, Will County, Illinois, as may be necessary to discharge the waters of the Desplaines River through said Section 31 in a proper manner, and shall also have the privilege of removing the old acqueduct piers in said section.

4th. That said party of the second part shall have the right to erect, attach, repair and maintain, said dam and other works or structure upon against the towpath bank of the Illinois and Michigan Canal in Section 25, Township 34 North, Range VIII East of the 3rd P. M., Grundy County, Illinois, but not so as to interfere in any manner with the use of said towpath in connection with said canal.

5th. That said party of the second part shall have the right to turn and divert from the Desplaines River into the Kankakee River a certain stream of water called the "Kankakee Cutoff", through, over and across said Kankakee Feeder and the ninety-foot strip on each side of said feeder in Section 5, Township 33, North, Range IX East of the 3rd P. M., and said party of the second part is granted the right to construct on the banks of said feeder controlling gates for flood protection from said Kankakee River.

6th. It shall be the duty of said party of the second part, subject to the direction of The Canal Commissioners, or other officers or agent as hereinafter indicated, to raise the towpath or bank of the Illinois and Michigan Canal from its present height not less than two feet and to any additional height that may be necessary to prevent overflow and to perpetually thereafter maintain the same in good condi-

tion. The raising of said towpath shall extend from the point in said Grundy County where the dam or other structure of said party of the second part intercept said towpath bank to lock Number Seven in Section 17, Township 34 North, Range IX East of the 3rd P. M., and when raised the width of the top of the towpath bank shall, conform to the width of the towpath as it exists at the present time.

Exhibit A
Defendant's
Exhibit 2

7th. Permission and authority is hereby given said party of the second part to attach and close a levee to the towpath bank of the Illinois and Michigan Canal at the point in said towpath bank where the east and west half section line of Section 20, Township 34 North, Range IX East of the 3rd P. M., intercepts said towpath bank; and further permission is also given to construct levees on the east and west banks of the DuPage River from the dam across said river to the north line of Section 20, Township 34 North, Range IX East of the 3rd P. M., and attach and close said levees to the west and east sides respectively of said dam across the DuPage River in Section 17, Township 34 North, Range IX East of the 3rd P. M., as indicated more clearly by the blue print
147 hereto attached and made a part of this contract as "Exhibit A."

8th. Permission is hereby given said party of the second part to use so much of the gravel or other material lying along said Illinois and Michigan Canal, the property of the State of Illinois, as may be necessary to raise said towpath bank of said Illinois and Michigan Canal. Such material, however, to be taken out from places indicated or approved by the General Superintendent of the Canal, or other officer or agent designated by the Canal Commissioners or other officers in charge.

9th. That the said party of the second part is hereby authorized to enter upon the lands or premises of the State of Illinois, part and parcel of the Illinois and Michigan Canal and to enter upon said canal itself in a manner and to the extent that shall be necessary to raise and maintain the towpath as above provided, and to attach and build said dam or other works onto said towpath bank as herein provided, and to repair, maintain or renew the same as shall become necessary to the preservation thereof.

10th. It is herein further stipulated and agreed by and between the said parties hereto that said party of the second part shall raise the building owned by the State of Illinois in Section 31, Township 34 North, Range IX East of the 3rd P. M., and used in connection with the Illinois and Michigan

Canal, to a level with the towpath of said canal when the
148 same is raised, as provided in Paragraph 6 hereof. Said party of the second part will also provide two acres of land to be used by said party of the first part in connection with said buildings as a garden. The raising of said buildings and the providing of said land shall be to the satisfaction of the General Superintendent or other officer or agent in charge of said canal.

11th. It is herein further stipulated and agreed by and between the parties hereto that all work hereinbefore provided for, or which shall affect the canal property or interests, shall be done under the supervision of, and to the satisfaction of The Canal Commissioners or their duly authorized agent or agents, and not otherwise; and such work when so completed shall at all times be kept and maintained by said party of the second part under the like supervision and to the approval of said The Canal Commissioners, or their officers or agent duly authorized to represent them.

12th. It is herein further stipulated and agreed by and between the parties hereto that the cost of inspecting the work herein provided for to be inspected by said party of the first part shall be paid by said party of the second part.

13th. It is herein further stipulated and agreed by and between the parties hereto that said party of the second part shall be responsible for and pay any and all damages that may be sustained by the State of Illinois, or The Canal
149 Commissioners, or the Canal property, or the persons or property using said Illinois and Michigan Canal, or that shall be occasioned by the construction of the works hereinbefore contemplated to be done or made by said party of the second part, or in the subsequent repair or maintenance thereof, or which shall be occasioned by the use of the dam, levees, or other works above provided for.

This Agreement shall be binding upon and inure to the benefit of the respective successors and assigns of the parties hereto.

In Witness Whereof, the said party of the first part has caused these presents to be signed by its president, and its corporate seal to be hereto affixed and duly attested, and said party of the second part has hereunto set his hand and seal the day and year first above written.

THE CANAL COMMISSIONERS,
C. E. SNIVELY,
President.

Attest:
W. R. NEWTON,
Secretary.

HAROLD F. GRISWOLD. (Seal)

150 EXHIBIT B.

Exhibit B. Defendant's Exhibit 2.

This Indenture, made this 2nd day of September, A. D. 1904, between The Canal Commissioners of the State of Illinois, party of the first part, and Harold F. Griswold, of the City of Evanston, County of Cook and State of Illinois, his successors and assigns, party of the second part, Witnesseth:

That the said party of the first part, in consideration of the covenants of the said party of the second part, hereinafter set forth, doth by these presents lease to the said party of the second part the following described property, towit:

The ninety foot strip along the towpath side and outside of the towpath of the Illinois and Michigan Canal in Sections 25 and 36, Township 34 North, Range VIII East of the 3rd P. M., Grundy County, Illinois, and said ninety foot strip in Sections 31, 30, 29 and 20, Township 34 North, Range IX East of the 3rd P. M., Will County, Illinois. Also that part of the North half of Section 31, lying south of the ninety-foot reserve strip along the towpath side of said canal. Also that part of the Kankakee Feeder and the 90-foot strip on each side of said Feeder in Section 31, Township 34 North North, Range IX East of the 3rd P. M. and in Section V, Township 33 North, Range IX East of the 3rd P. M., Will County, Illinois.

To Have and to Hold the same to the said party of the second part from the 2nd day of September A. D., 1904, to the second day of September, A. D. 1924, subject to a con-
151 tract dated the 2nd day of September A. D., 1904, to said Harold F. Griswold, affecting said premises.

And the said party of the second part, in consideration of the leasing the premises as above set forth, covenants and agrees with the party of the first part to pay the said party of the first part as rent for the same the sum of $500.00 in full for the term of this lease, the receipt of which $500.00 is hereby acknowledged.

And it is further covenanted and agreed between the parties aforesaid that said party of the second part is hereby charged with knowledge of all of the provisions contained in said contract with Harold F. Griswold, in so far as they affect the premises hereby leased.

It is further understood and agreed by and between the parties hereto that in case said party of the first part shall determine to re-lease the land hereby demised at the expiration of this lease that then and in such event the said party of the

second part shall have the first right to re-lease the same by paying therefor as much as shall be offered by any other person or party therefor, provided, however, that such rental may at the option of said party of the first part be ascertained, determined and fixed by three appraisers, one to be chosen by each of the parties hereto and the third by the two thus chosen, but in no event shall the rent be less than the amount fixed in this lease; and said party of the second
152 part hereby covenants and agrees that he will, and he hereby offers to pay the same rental as herein agreed to be paid for another term of twenty years, to begin at the expiration of the term hereby granted.

It is further understood and agreed that in case said party of the second part shall desire to re-rent said property for a further term of twenty years at a rental to be agreed upon by the parties hereto or fixed by appraisers as aforesaid, he shall notify said party of the first part in writing of such desire at least one year before the expiration of the term hereby demised.

The covenants herein shall extend to and be binding upon the heirs, executors, administrators, successors and assigns of the parties to this lease.

In Witness Whereof, the party of the first part has caused this instrument to be signed by its President and attested by its Secretary, and duly authorized its corporate seal to be hereunto attached, and said party of the second part has hereunto set his hand and seal the day and year first above written.

THE CANAL COMMISSIONERS

153 EXHIBIT C.

This Indenture, made this 8th day of August, A. D., 1905, between The Canal Commissioners of the State of Illinois, party of the First part, and Harold F. Griswold, of the City of Evanston, County of Cook and State of Illinois, his successors and assigns, party of the second part, Witnesseth:

Whereas, said party of the second part, has made applica-

Exhibit C
Defenda
Exhibit

tion to The Canal Commissioners of the State of Illinois to lease the right of the State to divert the waters of the Kankakee River into the Kankakee Feeder and discharge the same into the Desplaines River, in Section 31, Township 34, North, Range 9, East of the Third Principal Meridian; and also the right of the State to reconstruct the dam, the property of the State of Illinois, across the Kankakee River, in Section 9, Township 33, North Range 9, east of the Third Principal Meridian, and the right of the State to repair the bank of the said Kankakee Feeder and to construct at each end of said Feeder suitable gates for controlling the discharge of said waters through said Feeder; and

Whereas, The Atchison, Topeka & Santa Fe Railway Co., and the Chicago & Alton Railway Co., have made separate fills or embankments across said Feeder in Section 9, Township 33 North, Range 9 East of the Third Principal Meridian, with permission of The Canal Commissioners, and are now using the same as a part of their respective road-beds across said feeder;

Therefore, in consideration of the premises and the
154 covenants and agreements of said party of the second part, hereinafter following, the application of said party of the second part is hereby granted, and the said party of the first part, by these presents, doth lease to said party of the second part the rights of the State now within the control of The Canal Commissioners, to-wit: such right as is now under the control of The Canal Commissioners to divert the waters of the Kankakee River into the Kankakee Feeder and discharge the same into the Desplaines River, in Section 31, Township 34 North Range 9 East of the Third Principal Meridian, together with such right of the State as is now under the control of The Canal Commissioners to restore and reconstruct the dam across the Kankakee River, in Section 9, Township 33 North Range 9 East of the 3rd Principal Meridian, but in such restoration the crest of such dam shall not be higher than it has heretofore been; also such right of the State as is within the control of The Canal Commissioners to construct at each end of said Kankakee Feeder suitable gates for controlling the discharge of the waters of said Kankakee River through said Feeder; and such right as The Canal Commissioners now have to enter upon the Kankakee Feeder and the dam in connection therewith, for the purpose of repairing the banks of said Feeder or repairing the dam across said Kankakee River or the gates at each end of said Feeder; to have and to hold the same for the full period

155 of twenty (20) years from the date hereof, subject however to whatever legal rights said railway companies respectively have to cross said Feeder upon such embankments and otherwise, also subject to the provisions of certain leases heretofore made to Harold F. Griswold of the City of Evanston, and Charles A. Munroe, of the City of Chicago, both of the County of Cook and State of Illinois.

And the said party of the second part further agrees to pay to the said party of the first part, as the consideration for the rights hereinabove described, the sum of one hundred and fifty dollars ($150.00) per year for each and every year of the term hereby demised, payable on the 10th day of August A. D., 1905, and on the 10th day of August in each and every year of said term hereby demised.

And it is further provided that said party of the second part shall have the right to cancel this lease at any time at his option after five (5) years from the date hereof.

It is herein further stipulated and agreed by and between the said lessor and lessee as a part of the consideration of this lease, that at the expiration of this lease, or in case of the earlier termination thereof under its provisions, or in accordance with the law, that said lessee, the party of the second part, shall restore the said dam, and feeder, to its present condition, and restore the flowage of all water to its present channel at his own and sole expense, unless he shall be
156 directed not to do so by written notice from said party of the first part or other officers or officer at such time having charge of said Illinois and Michigan Canal; and in case of failure on the part of said lessee so to do, the said party of the first part, or other officers or officer, in charge of said canal, shall have the right to so restore said dam, feeder and water to its present condition at the expense of said party of the second part; and said party of the second part, for himself, his heirs, executors, administrators and assigns, hereby covenants and agrees to and with said party of the first part and the officer or officers at such time in charge of said canal, and the State of Illinois, that he will refund and pay to them or it the full cost of the restoration of such dam, feeder and water to its present condition and place, within thirty (30) days after he or they shall be presented with a statement of such cost and expense.

It is herein further expressly stipulated and agreed by and between the parties hereto, and said party of the second part hereby, for himself, his heirs, executors, administrators and assigns, covenants and agrees to and with said party of the

first part, the officer or officers in charge of the Illinois and Michigan Canal, and the State of Illinois, that he, and they, will fully and completely protect, save and keep harmless, the said party of the first part, such officer or officers, and said State of Illinois, from any and all damages and
157 claim for damages which may be made against such officers or said State by reason of, or growing out of any work which said party of the second part, his heirs, executors, administrators or assigns shall or may do, or shall attempt to do under and by virtue of this instrument or any of the rights granted or attempted to be granted hereby, whether by the flowage of land, back water, change of present channel or flowage of water or otherwise, whether of the kind or character herein enumerated or different or otherwise, including any and all costs, expenses and attorneys fees which shall or may grow out of, or be incurred in connection with any and all such claims made or asserted, or suits brought in reference thereto; and said party of the second part, his heirs, executors, administrators and assigns, likewise, as further and additional security and protection against loss or claims, further covenants and agrees that, he and they, will, before any work shall be commenced under this contract, duly execute, acknowledge and deliver to said party of the first part a bond of indemnity in such form and for such an amount as they, the said party of the first part, shall determine and specify and shall be adequate to fully and completely protect said party of the first part, said officer or officers and said State of Illinois against any and all damages, loss, cost, expense and attorney's fees which shall be made, claimed, or be incurred or grow out of any and all things done or at-
158 tempted to be done by said party of the second part, his heirs, executors, administrators or assigns, under or by virtue of this instrument; and in case said party of the second part, his heirs, executors, administrators or assigns, or any of them, shall fail or refuse to duly execute and deliver such bond, within thirty (30) days after written request therefor shall be served upon him or any of them, then, and in such event, all rights granted under this instrument shall at once cease and determine and shall at once revert to and revest in said party of the first part and the State of Illinois.

It is herein further provided that this lease may be extended for a further period of twenty years at a rent to be fixed by an appraisal, to be made by three disinterested appraisers, to be appointed by the Governor and the rent fixed by such appraisal shall be subject to the approval of The

t C to ndant's bit 2.

Canal Commissioners or other proper officers of the State at such time having charge of the Canal property.

It is herein further stipulated and agreed, and the Canal Commissioners hereby expressly reserve the right to cancel this lease and recover possession of the land, property and rights above demised and referred to whenever in the judgment of The Canal Commissioners, or other proper officers of the State at such time having charge of Canal property, they shall deem the interests of the State require it to repossess and use said property for State purposes.

159 In Witness Whereof, the party of the first part has caused this instrument to be signed by its President, and attested by its Secretary and duly authorized its corporate seal to be attached, and said party of the secoid part has hereunto set his hand and seal the day and year first above written.

Office of The Canal Commissioners,
Lockport Ill., June 11, 1904.

To the Honorable Richard Yates,
Governor of the State of Illinois,
Springfield, Illinois.

Dear sir:

The undersigned Canal Commissioners recommend that the interest of the State of Illinois in and to the parcel or tract of land hereinafter specifically described, being part of the canal lands or lots of the State of Illinois other than those connected with water power upon the said canal and the ninety foot strip along the canal:

A tract or parcel of land in Section Thirty-one (31), Township Thirty-four (34) North of Range Nine (9) East of the Third (3rd) Principal Meridian, which lies north of the center of the Desplaines River and south of the Ninety Foot reserve line of the Illinois and Michigan Canal, in the County of Will and State of Illinois,

Should be sold, as in our judgment the interest of the State will be promoted thereby: and

The Canal Commissioners request the approval of your Excellency to the sale thereof at public auction to the highest and best bidder for cash at the Canal Office in Lockport, Illinois, on the Second (2nd) day of August, 1904, at Ten o'clock in the morning, thirty (30) days previous notice
162 of said sale being first given in some newspaper published in the County of Will where such tract or parcel of land is situated.

Signed C. E. SNIVELY

175 EXHIBIT K.

"Memorandum of agreement made and entered into between the Canal Commissioners of the State of Illinois, party of the first part, and Harold F. Griswold, of the City of Evanston, County of Cook and State of Illinois, his successors and assigns, party of the second part, witnesseth:

"That the Canal Commissioners, in consideration of the covenants and agreements hereinafter set forth, to be kept and performed by the said party of the second part, hereby grants to said party of the second part, the right to place and thereafter maintain a line of poles along and upon the land belonging to the State of Illinois, part and parcel of the Illinois and Michigan Canal lands, to be located as hereinafter designated, between the west line of Section 25, Township 34, North, Range 8, Grundy County, Illinois, and Roby street in the City of Joliet, Will County, Illinois; and between the west line of Section 25, Township 34, North, Range 8, Grundy County, Illinois, and the west limits of the City of Morris, in the County of Grundy and State of Illinois. Said line of poles and wires are to be located and built .....
side of the said Canal, and under the direction and supervision of said Canal, or the officer having charge and supervision of the said Canal; provided that where, in the judgment of said superintendent, or officers, the topography
176 of the ground makes it necessary or expedient to have said poles upon the towpath bank of said canal, authority is hereby given to said party of the second part to cross said canal and place poles along the said towpath bank. The necessity or expediency thereof, the place and manner of crossing and placing said poles along said towpath bank to be subject to the approval, and under the direction and supervision of said superintendent, or officer. It is distinctly understood, however, that the aforesaid line of poles shall not, in any event, be located, or maintained in said place, or manner as to interfere with the use or operation of the said canal.

"To have and to hold said privilege to the party of the second part, his successors and assigns, until the 2nd day of September, A. D., 1924; provided that the Canal Commissioners reserve the right to at any time require any change to be made in the location of said line of poles, subject, how-

ever, to any pole line rights now existing, and the right to grant other pole line rights is hereby expressly reserved by the said party of the first part. Exhibit Def Exh

"In consideration of the above, the said party of the second part, for himself, his successors and assigns, covenants and agrees to pay to the Canal Commissioners the sum of $750. for said right between the said west line of section 25, Township 34, North, Range 8, Grundy County, Illinois,
177 and Roby street, in the city of Joliet, Will County, Illinois, and the sum of $250. for said right between the west line of said Section 25 and the west line of the City of Morris, in said Grundy County, Illinois, the receipt of which $750. and said $250. is hereby acknowledged.

"It is hereby further stipulated and agreed that said poles shall be used for the sole and only purpose of stringing thereon the wires of the said party of the second part to carry electricity from and generated at the proposed plant of the said party of the second part, in Section 25, Township 34, North, Range 8, Grundy County, Illinois.

"The said party of the second part further covenants and agrees that it will construct and maintain said pole line and wires in good and workmanlike manner, and will so maintain and operate the same as not to interfere with business along said canal, or the business or property of other persons, or corporations, and also assume all liability for all deaths or personal injuries, or injury to property, or others, which may occur by reason of the construction, or operation of said pole lines, and that it will forever indemnify and save harmless the Canal Commissioners of the State of Illinois from and against all claims or liabilities for or by reason of any damage, the risk of which is hereby assumed by the party of the second part; and also from and against all claims,
178 liabilities or judgments on account of any death or injury, or damage to personal property, all liability for which is assumed by the party of the second part, and the party of the second part agrees to pay all charges and expenses that may be incurred, or any judgments that may be rendered by reason thereof.

"In witness whereof, the said party of the first part have caused this instrument to be signed by the president and attested by its secretary and has duly authorized its corporate seal to be hereunto attached; and said party of the second

179 EXHIBIT L.

Resolved, by the Senate, the House of Representatives concurring herein, That there shall be submitted to the electors of this State at the next election of members of the General Assembly, a proportion to amend the constitution of this State, to-wit:

Resolved, That the separate action of the constitution of this State relating to the canal be amended to read as follows:

The Illinois and Michigan canal, or other canal or waterway, owned by the State shall never be sold or leased until the specific proposition for the sale or lease thereof shall first have been submitted to a vote of the people of the State at a general election, and have been approved by a majority of all the votes cast at such election. The General Assembly shall never loan the credit of the State or make appropriations from the treasury thereof, in aid of railroads or canals;

Provided, That any surplus earnings of any canal, waterway or water power may be appropriated or pledged for its enlargement, maintenance or extension; and,

Provided, further, That the General Assembly may, by suitable legislation, provide for the construction of a deep waterway or canal from the present water power plant of the Sanitary Drainage District of Chicago, at or near Lockport, in the township of Lockport, in the County of Will, to a point in the Illinois river at or near Utica, which may be practical
180 for a general plan and scheme of deep waterway along a route, which may be deemed most advantageous for such plan of deep waterway; and for the erection, equipment and maintenance of power plants, locks, bridges, dams and appliances sufficient and suitable for the development and utilization of the water power thereof; and authorize the issue, from time to time, of bonds of this state in a total amount not to exceed twenty million dollars, which shall draw interest, payable semi-annually, at a rate not to exceed four per cent per

annum, the proceeds whereof may be applied as the General Assembly may provide, in the construction of said waterway and in the erection, equipment and maintenance of said power plants, locks, bridges, dams and appliances.

All power developed from said waterway may be leased in part or in whole, as the General Assembly may by law provide; but in the event of any lease being so executed, the rental specified therein for water power shall be subject to a revaluation each ten years of the term created, and the income therefrom shall be paid into the treasury of the State.

Concurred in by the House October 16, 1907, by a two-thirds vote.

181 EXHIBIT M.

To The Economy Light and Power Company:

I, W. H. Stead, as Attorney-General of the State of Illinois, by virtue of the authority vested in me by law do hereby notify and command you, and your officers, agents, servants and representatives, to cease and desist from in any manner infringing upon, trespassing upon or interfering with the lands owned by the State of Illinois or in which the State of Illinois or the people of the State of Illinois have an easement for the benefit of the public, and located in Section Number Twenty-five (25), in Township Number Thirty-four (34) North, in Range Number eight (8) East of the Third Principal Meridian, in Grundy County, Illinois, by the erection of a dam thereon or otherwise, and to cease and desist from in any way obstructing the Des Plaines River or Illinois River in said Section or elsewhere.

And you are further notified and commanded to remove any and all obstructions that you may have placed upon said premises, whether the same be in the bed of the Des Plaines River or otherwise located.

Grundy County. }

I Fred S. Johnson, Clerk of the Circuit Court of Grundy County, in the State aforesaid, and keeper of the records and files of said Court, do hereby certify the above and foregoing to be a true, perfect and complete copy of Bill of Complaint, Filed December 30" 1907 in a certain cause lately pending in said Court on the Chancery side thereof, wherein The People ex rel. Charles S. Deneen & William H. Stead, Atty. Gen. were complainants & The Economy Light & Power Co., was defendant, as the same appears from the records and files of said Court now in my office remaining.

In Witness Whereof, I have hereunto set my hand and affixed the seal of said Court at Morris, this 10" day of December, A. D. 1913.

FRED S. JOHNSON,
Clerk.

IN THE CIRCUIT COURT OF GRUNDY COUNTY,
Illinois.

People of The State of Illinois on the relation of Charles S. Deneen, Governor of said State,
vs.
Economy Light & Power Company.

The Answer of Economy Light & Power Company, Defendant, to the Bill of the People of the State of Illinois on the Relation of Charles S. Deneen, Governor of Said State, Complainant.

ISHAM, LINCOLN & BEALE,
SCOTT, BANCROFT & STEPHENS,
Solicitors for Defendant.

184 IN THE CIRCUIT COURT OF GRUNDY COUNTY, Illinois.

Defen Exhi

People of The State of Illinois on the relation of Charles S. Deneen, Governor of said State,
vs.
Economy Light & Power Company.

The Answer of Economy Light & Power Company, Defendant, to the Bill of Complaint of the People of the State of Illinois on the Relation of Charles S. Deneen, Governor of Said State, Complainant.

This defendant, reserving to itself all right of exception to the said bill of complaint, for answer thereto says:

That as to so much and such parts of said bill as allege that the title to the lands lying without the alleged meander lines of Desplaines River through section 25, township 34 north, range 8, east of the third principal meridian, in
185 Grundy County, Illinois, and the lands lying in the bed of the stream of said Desplaines River, through said section 25, is in the State of Illinois, this defendant avers that the People of the State of Illinois upon the relation of Charles S. Deneen as Governor of the State of Illinois, are not the proper parties to exhibit said bill, and this defendant avers that if said lands have not been alienated by the State of Illinois they remain a part of the canal lands, and under section 9 of the act of the legislature of the State of Illinois, entitled "An act to revise the law in relation to the Illinois & Michigan Canal and for the improvement of the Illinois and Little Wabash Rivers," approved March 27th, 1874, in force July 1, 1874, it is made the duty of the Canal Commissioners of the Illinois and Michigan Canal "to take all necessary proceedings on behalf of the State to establish the title of the State and to recover possession of any canal lands or real estate owned by the State which may be claimed by or be in the adverse possession of another person or party," and they are thereby directed "when necessary for that purpose, to cause appropriate suits in the name of the People of the State of Illinois to be instituted and prosecuted therefor." And this defendant avers that if the title to said lands outside of the alleged meander lines along the said Desplaines River and in the bed thereof remains in the State, it only so

dant's ibit I.

remains in the State in trust for canal purposes and the Canal Commissioners of the Illinois & Michigan Canal are the proper parties to cause said suit to be brought and to control the same, and that the Attorney General of said State upon the relation of Charles S. Deneen, the Governor thereof,
186 or otherwise, has no right, power or authority to institute or prosecute this suit without the express consent and direction of the Canal Commissioners of the Illinois & Michigan Canal; and said bill does not show that it is exhibited by or with the authority of said Canal Commissioners, but, on the contrary thereof, shows that it is not exhibited by or with their authority. And this defendant as to so much of said bill as alleges title to said lands outside of the meander lines along said Desplaines River, and in the bed of the stream, through section 25, to be in the State of Illinois, avers that there is a lack of proper parties complainant, and a lack of power or authority in the Attorney General of the State of Illinois to institute or prosecute said suit, and it prays the same advantages of this answer as if it had demurred to such parts of said bill upon the ground of want of proper parties, and lack of power or authority in the Attorney General of said State to institute or prosecute said suit.

And as to so much and such parts of said bill as charge that this defendant is a trespasser upon such lands, this defendant avers that said Attorney General has no right, power or authority to exhibit or maintain said bill in the name of the People of the State of Illinois upon the relation of Charles S. Deneen, the Governor of said State, or otherwise, but defendant avers that by virtue of the third clause of section nine of said act of March 27, 1874, entitled "An act to revise the law in relation to the Illinois and Michigan Canal and for the improvement of the Illinois and Little Wabash Rivers," the power and authority to cause suits to be commenced and prosecuted against persons trespassing upon canal lands
187 belonging to the State of Illinois is vested in the Canal Commissioners of the Illinois and Michigan Canal, and said bill does not show that it is exhibited by said Attorney General by or with the authority or consent of said Canal Commissioners, but, on the contrary thereof, shows said bill is not exhibited with their authority, and this defendant, as to so much and such parts of said bill as charge that this defendant is a trespasser upon the canal lands of the State, avers that the Attorney General of the State of Illinois has no lawful authority to exhibit said bill either in the name of the People of the State of Illinois upon the relation of Charles

S. Deneen, Governor thereof, or otherwise; and this defendant prays the same benefit of this defense as if it had pleaded or demurred to such parts of said bill upon that ground. Defendant's Exhibit I

This defendant further avers that by the eighth section of said act of March 27, 1874, revising the law in relation to the Illinois & Michigan Canal, etc., said Canal Commissioners are given the control and management of the Illinois and Michigan Canal, including its feeders, basins and appurtenances and the property thereto belonging and that by the eighth clause of said section 8 there is vested in the Canal Commissioners of the Illinois & Michigan Canal full power and authority to lease canal lands or lots owned by the State, to sell and convey any canal lands or lots owned by the State, whenever in their judgment the interest of the State would be promoted thereby, and by section 3 of said act it is provided that suits may be prosecuted by them in the name of "The Canal Commissioners"; and defendant avers that if the flowage contract and lease, dated the 2nd day of Sep-
188 tember, 1904, Exhibits A and B, and the contract of August 8, 1905, Exhibit C, and the deed of January 6, 1905, Exhibit J, to said bill, or any or either of them, are void, the Canal Commissioners are the proper parties, and the only parties, who can maintain an action to set aside said contracts, lease and deed, or any or either of them, and that the Attorney General of the State of Illinois on the relation of Charles S. Deneen, the Governor of said State, or otherwise, has no power or authority to bring or maintain said action, but that any suit to set aside said contracts, leases and deeds can only be prosecuted by said Commissioners in the name of the Canal Commissioners of the Illinois and Michigan Canal; and said bill does not show that it is exhibited by or with the authority of said Canal Commissioners of the Illinois and Michigan Canal, but, on the contrary thereof, shows that it is not exhibited by or with their authority; and this defendant prays the same benefit of this defense as if it had specifically pleaded or demurred to so much and such parts of said bill as seek to have said contracts, leases and deeds declared null and void, for want of proper parties complainant, and for lack of power or authority in the said Attorney General to institute or prosecute said suit.

Defendant avers that as to so much of said bill as alleges that the said contracts, leases and deeds thereto attached, are null and void, the complainant has a complete and adequate remedy at law, and is not entitled to any relief from a court of equity, and the defendant prays the same benefit of

Defendant's Exhibit I.

said defense as if it had pleaded or demurred to said bill of complaint therefor.

189 This defendant avers that said bill shows that the land outside of the alleged meander lines of the Desplaines River in section 25, township 34 north, range 8, east of the third principal meridian, in Grundy County, Illinois, and in the bed of said River in said section 25; and also that part of section 31, township 34 north, range 9, east of the third principal meridian, in Will County, Illinois, lying southwest and southeast of the Illinois and Michigan Canal and northeast and northwest of the Desplaines River (excepting a strip of land 90 feet in width on the southerly side of said Canal) are in the possession of this defendant under bona fide claim of title thereto deduced from the State of Illinois, and defendant avers that so much of said bill as alleges that the title to said lands is in the State of Illinois, and that the defendant is a trespasser thereon, involves the question of the title to said lands, which may be tried and determined at law, and with respect to which the complainant has a complete and adequate remedy at law, and is not entitled to any relief from a court of equity, and as to which the defendant is entitled to a trial by jury as guaranteed by the VII amendment to the Constitution of the United States and by section 5 of Article II of the Constitution of the State of Illinois; and this defendant prays the same benefit of this defense as if it had pleaded or demurred to so much of said bill of complaint as seeks to adjudicate the question of the title to such lands.

And this defendant further avers that by virtue of section 35 of Chapter 45 of the Revised Statutes of the State of Illinois this defendant is entitled to have its claim of title determined in two separate trials before two separate juries,

190 and defendant prays the same benefit of this defense as if it had demurred or pleaded the same in bar to said bill of complaint.

This defendant avers that said bill is an attempt to take the property of this defendant for public purposes, and that by virtue of Section 14 of Article XI of the Constitution of Illinois, this defendant is entitled to have its compensation for the property sought to be taken, fixed by a trial by jury, and it prays the same benefit of this defense as if it had pleaded or demurred to said bill on that ground.

Defendant further avers that said bill is multifarious in that it joins three separate and distinct causes of action:

1st. An alleged cause of action in which the State claims title to certain lands in fee in the capacity of private owner;

2nd. An alleged cause of action in which the State in its sovereign political capacity seeks to assert the rights of the public in an alleged public highway; and

3rd. An alleged cause of action in which the State in its capacity as private owner seeks to set aside certain contracts, deeds and leases which it claims were executed by the Canal Commissioners of the State of Illinois without authority.

And this defendant prays the same advantage of this answer as if it had demurred to said bill on the ground of multifariousness.

This defendant further says that the deed, leases and contracts mentioned in said bill, if voidable, could only be set aside upon restitution to this defendant of the considera-
191 tion paid therefor by Harold F. Griswold, but the people do not in their said bill offer to return the said consideration.

This defendant admits that in the early history of our country a certain territory embracing what is now the States of Ohio, Indiana, Michigan and Wisconsin, was claimed to be owned by Virginia.

Admits that by certain acts of the legislature of Virginia, and by its deed of cession, said territory was conveyed to the United States, as is alleged in the second paragraph of said bill, and that on, to-wit, the 13th day of July, 1787, the Congress of the United States then existing under the articles of Confederation, enacted the ordinance commonly known as the ordinance of 1787.

Admits that section 14 of said ordinance provided that the Articles therein should be considered as articles of compact between the original states and the people and states in said territory, and should forever remain unalterable, unless by common consent, and admits that Article IV provided that "the navigable waters leading into the Mississippi and St. Lawrence, and the carrying places between the same, shall be common highways, and forever, free, * * * without any tax, impost or duty therefor," and this defendant avers that it was also provided in said ordinance, in the fifth article thereof, that the states thereafter to be formed out of said territory should be admitted into the Congress of the United States "on an equal footing with the original states, in all respects whatever."

Admits that on the 18th day of May, 1796, Congress passed an act entitled "An Act providing for the sale of lands
192 of the United States in the Territory Northwest of the River Ohio and above the mouth of the Kentucky River,"

ndant's hibit I.

and admits that section 9 of said act provided that "all navigable rivers within the territory to be disposed of by virtue of this act shall be deemed to me and remain public highways."

But this defendant alleges that said act, by the provisions thereof, did not relate to or affect the land in controversy in this bill, and that said act is wholly immaterial, irrelevant and impertinent to the issues sought to be raised by said bill, and to the relief prayed therein, and defendant prays the same benefit of this answer as if it had excepted or demurred to such portion of said bill upon those grounds.

Defendant admits the organization of Indiana Territory as alleged in said bill.

Defendant further admits that on the 26th day of March, 1804, Congress passed a statute entitled "An Act making provision for the disposal of the public lands in the Indiana Territory and for other purposes," and that by section 6 thereof it was provided that "all the navigable rivers, creeks and waters within the Indiana Territory shall be deemed and remain public highways."

This defendant admits that Congress, by its act of February 3, 1809, entitled "An act for dividing the Indiana Territory into two separate Governments," provided that that portion of Indiana Territory which now comprises the State of Illinois, for the purpose of temporary government, should constitute a separate territory to be called Illinois, and admits that it was provided in said act that there should be
193 established within such territory a government in all respects similar to that provided by the ordinance of 1787, and that the inhabitants thereof should be entitled to and enjoy all the rights, privileges and advantages granted and secured to the people of the territory of the United States northwest of the River Ohio by said ordinance.

Defendant further admits that on the 18th of April, 1818, Congress enacted a statute to enable the people of Illinois to form a constitution and state government, and for the admission of said state into the Union on an equal foot with the original states, and that said statute provided that said government should be republican, and not repugnant to the ordinance of 1787.

Defendant further admits that the people of the Illinois Territory adopted a constitution known as the constitution of 1818, the preamble of which recited that the people of the Illinois Territory, having the right of admission into the general government as a member of the Union, consistent with

Defends Exhib

the Constitution of the United States, the ordinance of Congress of 1787, and the law of Congress approved April 18, 1818, entitled "An act to enable the people of the Illinois Territory to form a constitution and state government, and for the admission of such state into the Union on an equal footing with the original states," did agree to form themselves into a free and independent state.

Defendant further admits that on December 3, 1818, the Congress adopted a resolution declaring the admission of the State of Illinois into the Union, and the said resolution declared, among other things, that the

194 "constitution and state government, so formed, is republican, and in conformity to the principles of the articles of compact between the original states and the people and the states in the Territory Northwest of the River Ohio, passed on the 13th day of July, 1787."

And this defendant avers that the second section of said resolution declared that the State of Illinois should be one of the United States of America "and admitted into the Union on an equal footing with the original states, in all respects whatever," and defendant avers that upon admission of the State of Illinois into the Union said ordinance of 1787 ceased to have, has not since had, and has not now, any operative force within her territory.

This defendant further admits that the River Desplaines is situated in said territory, but denies that it flows a distance of 96 miles through the Counties of Lake, Cook, Will and Grundy in Illinois.

This defendant further admits the allegations in paragraph III of said bill relating to the Kankakee River, but this defendant alleges that the allegations concerning the Kankakee River are wholly immaterial, irrelevant and impertinent to the questions sought to be raised by said bill and the relief prayed thereby, and defendant prays the same benefit of this answer as if it had pleaded or demurred thereto upon such grounds.

Defendant admits that the Desplaines River is wholly within the territory originally comprising what was known as the Northwest Territory, but denies that said river is subject to the provisions of the acts of Congress set forth in the bill.

195 Further answering, this defendant denies that it is shown by the history of the explorations and discoveries of the territory in what is now the northern part of Illinois, or otherwise, that at the time of the explorations and discov-

Defendant's Exhibit I.

eries, or at any other time, the Desplaines River was navigable from a point near where is now situated the City of Chicago, or from any other point, to the mouth of said Desplaines in what is now Grundy County, or to any other point; and this defendant further denies that by the same history, or otherwise, it is shown that the portion of the Desplaines River last above mentioned was used in the early period of the State of Illinois as a highway for commercial purposes, and denies that commerce was carried on over said river, and denies that connection was made with the Chicago River by a short portage between the two rivers near the site of what is now the City of Chicago, and denies that it was in use as a highway of commrce leading from Lake Michigan and the waters emptying into the St. Lawrence, on the one hand, to the Illinois River, and the waters of the Mississippi on the other hand, thenceforward from the time of said first use, or from any time, up to and at the time when the said ordinance of 1787 and the several acts of Congress were respectively enacted.

This defendant further answering denies that the State of Illinois by and through its legislature and in obedience to the several acts of Congress set forth in said bill, or otherwise, assumed or took charge of the said Desplaines River, but admits that the State of Illinois did by a certain act mentioned in said bill, purport to authorize the building of a
196 toll bridge across the Desplaines River on the northeast quarter of section 11, township 39 north, range 12, east of the third principal meridian, and the southeast quarter of section 2 in said town and range, but denies that said act authorized the construction of two bridges, and avers that said act was not passed by virtue of or as a recognition of, any power of the state over said river, but merely to confer upon the persons therein mentioned the franchise to collect toll for traffic over such bridge, and avers that the place where said bridge was so authorized to be located, and was located, was not in that part of the river involved in this case, but was near the Village of River Forest in Cook County on that part of said Desplaines River which was declared navigable by the Legislature of Illinois by its act of February 28, 1839, entitled "An act declaring the Desplaines River a navigable stream."

And admits that afterwards the legislature of the State of Illinois passed an act entitled "An act to amend the several laws in relation to the Illinois & Michigan Canal," in force February 26, 1839, but denies that sub-section 9 of section 2 thereof provided

Defendant's Exhibit

"that no stream of water passing through the canal lands shall pass, by the sale, so as to deprive the state from the use of such water, if necessary to supply the canal, without charge for the same."

And denies that sub-section 11 of said act provided that "lands situated upon streams which have been meandered by the surveys of public lands by the United States shall be considered as bounded by the lines of those surveys and not by the streams,"

but defendant avers that it was provided in section 2 of said act that in all sales of lands and lots under the pro-
197 visions of said act certain conditions should be annexed, and should compose a part of the contract, which conditions included the conditions set forth in sub-sections 9 and 11 of said section 2 above quoted.

And defendant avers that said bill does not allege that the use of any of the water of any stream passing through the lands described in said bill is necessary for the use of such canal; but defendant alleges that on the contrary thereof the use of such water is not necessary to supply the said canal, and that the said Canal Commissioners do not need or desire said waters for canal purposes; and defendant avers that if the use of such water was necessary to supply the canal, the Canal Commissioners would be the proper parties to take such steps as might be necessary to obtain such water, and that the people of the State of Illinois by their Attorney General upon the relation of Charles S. Deneen, their Governor, or otherwise, have no authority to bring or maintain any suit for the purpose of acquiring the waters of such streams for such purposes or otherwise.

And defendant denies that the lands for the Desplaines River were meandered by the survey of the United States.

Defendant avers that section 2 of said act of February 26, 1839, and sub-sections 9 and 11 of section 2, by the express terms thereof, only apply to sales by the Canal Commissioners of lands and lots theretofore authorized to be sold.

And this defendant avers that by the provisions of an act of the Legislature of the State of Illinois passed and in force
198 February 21, 1843, entitled "An act to provide for the completion of the Illinois and Michigan Canal, and for the payment of the canal debt," granting to the Board of Trustees of the Illinois and Michigan Canal, the canal and canal lands, it was provided in section 18 thereof, that when said act should go into effect, so much of the acts theretofore passed by the Legislature of said State in relation to the

ndant's hibit I.

Illinois and Michigan Canal, and the canal lands and property, as conflicted with the provisions of that act, were thereby repealed; and this defendant avers that said sub-sections 9 and 11 of section 2 of the said act of 1839 were in conflict with the provisions of said act of February 21, 1843, and were thereby repealed.

And this defendant avers that by section 13 of said act of February 21, 1843, it was provided that sales of lands should be made in the manner prescribed in the act of the 9th of January, 1836, and this defendant avers that on such provisions as were contained in sub-sections 9 and 11 of section 2 of the act of 1839 were contained in said act of 1836.

This defendant further answering, admits that the Legislature of Illinois, by an act approved and in force February 28, 1839, declared the Desplaines River from the point where it most nearly connects itself with the Illinois and Michigan Canal, to its source within the boundaries of said State, a navigable stream, and declared that it should be deemed and held a public highway and should be and remain, free, open and unobstructed, from said point of connection with said canal to its utmost limits within said state for the passage of all boats and water-craft of every description.

And this defendant avers that said river was not in
199 fact navigable through the course described, or any portion thereof, and denies that the Legislature of said State could by its enactment impart to said stream the character of navigability which it lacked before the passage of said act; and defendant avers that said declaration was a recognition by the Legislature of the State of Illinois that said Desplaines River from the point where said river most nearly connects itself with said canal to its mouth was not navigable and defendant avers that the point where it is constructing its said dam is in that part of said river.

And this defendant, further answering, admits that the Legislature of the State of Illinois, by act of March 3, 1845, authorized Stephen Forbes to construct a dam across the Desplaines River in Cook County on the southwest quarter of section 36, township 39 north, range 12 east, and on the northeast quarter of section 2, township 38 north, range 12, east, in Cook County, Illinois; and that said statute contained the proviso:

"That this act shall not operate to prevent the State from improving said river by dams or from using the water in said river for the Illinois and Michigan Canal at any time hereafter, or for any other purpose";

and this defendant alleges on information and belief that said Stephen Forbes did, pursuant to this act, and on or about the year 1866, construct a dam across said Desplaines River on section 2, in township 38 north of range 12, east, and section 35, township 39 north of range 12 east, without any provision therein for the passage of boats, and he and his grantees and successors in title or interest have maintained said dam ever since, without any provision therein for the passage of boats, and that no boats ever could
200 or did pass said dam, from the date of the construction thereof down to the present time; and this defendant alleges that the place where said dam was authorized to be constructed, and was so constructed, was in that part of said Desplaines River which had theretofore been declared a navigable stream by the Legislature of Illinois; and that said act, authorizing the construction of said dam by said Stephen Forbes, and the construction of said dam were inconsistent with the use of said stream for the purposes of navigation, and that the said dam so constructed by said Forbes would have completely prevented the navigation of said stream if said stream had in fact been navigable.

This defendant further admits that the Legislature of the State of Illinois, by its certain law, entitled "An act authorizing the building of a bridge and road in township 36 north, range 10 east, in Will County," approved and in force February 12, 1849, authorized the construction of a bridge over the Desplaines River at Lockport in Will County, but this defendant avers that said act of the legislature authorizing the construction of said bridge is inconsistent with the use of said stream as a navigable stream, and defendant avers that the object of said act was to provide for the submission to the voters of said township 36 of the question of levying a tax for the purpose of improving the road from the canal bridge in the town of Lockport to some suitable point on the opposite bluff and constructing a bridge across said stream at Lockport upon said road, and not for the purpose of authorizing the construction of a bridge over a navigable stream.

This defendant further answering, admits that the Legislature of the State of Illinois, by its certain act entitled
201 "An act to create Sanitary Districts, and to remove obstructions in the Desplaines and Illinois Rivers," approved May 29, 1889, in force July 1, 1889, provided as is set out in said bill, and admits that section 23 of said act provided that

dant's ibit I.

said act should not be construed to authorize the injury or destruction of existing water-power rights.

And this defendant avers that the water-power rights which are involved in this cause were in existence at the date of the passage of said act and have since been acquired by this defendant, and that said act not only does not furnish the complainant any right to injure or destroy said right, but, on the contrary thereof, expressly prohibits the injury or destruction thereof.

Defendant further admits that it was provided in section 24 of said last mentioned act, that "whenever the general government shall improve the Desplaines and Illinois Rivers for navigation, to connect with this channel, said general government shall have full control over the same for navigation purposes."

And this defendant avers that said section 24 is a recognition by the Legislature of the State of Illinois that the Desplaines River is not a navigable stream.

This defendant further admits that the Legislature of the State of Illinois, on May 14, 1903, enacted a certain statute entitled "An act in relation to the Sanitary District of Chicago," etc., as is alleged in paragraph IV of said bill, but this defendant avers that said act of May 14, 1903, is wholly irrelevant, immaterial and impertinent, and shows no right, title or interest on the part of the relator, or the State of
202 Illinois, or the people thereof, in or to the subject matter of said bill, or the relief prayed therein, and defendant prays the same benefit of this answer as if it had demurred therefor.

This defendant further answering, admits the organization of the Sanitary District known as the Sanitary District of Chicago, and the construction of the channel as alleged in paragraph IV of said bill, but alleges that said fact is wholly immaterial, irrelevant and impertinent, and prays the same advantage of this answer as if it had demurred therefor.

Defendant admits that afterwards the State of Illinois enacted a certain statute, approved December 6, 1907, and entitled "A bill for an act recognizing the Desplaines and Illinois Rivers as navigable streams, and to prevent obstructions being placed therein, and remove obstructions therein now existing." And that section 1 of said act provided:

"Be it enacted by the people of the State of Illinois represented in the General Assembly: That the Des Plaines and Illinois Rivers throughout their courses from and below the water-power plant of the main channel of the Sanitary Dis-

trict of Chicago in the township of Lockport, at or near Lockport, in the County of Will, are hereby recognized as and are hereby declared to be navigable streams; and it is made the special duty of the governor and of the attorney general to prevent the erection of any structure in or across said streams without explicit authority from the general assembly; and the governor and attorney general are hereby authorized and directed to take the necessary legal action or actions or remove all and every obstruction now existing in said rivers, that in any wise interferes with the intent and purpose of this act,"

203 But this defendant alleges that so much of said act as declares the rivers mentioned therein to be navigable streams, is unconstitutional and of no effect, inasmuch as the power to adjudge and declare the navigability of streams is vested exclusively in the judiciary; and the defendant further alleges that said act is unconstitutional in that:

1st. The body of said act is broader than the title thereof;

2nd. It confers upon the Attorney General and Governor of the State of Illinois judicial powers, to wit, the determination of what obstructions interfere with the intent and purpose of said act;

3rd. It deprives this defendant of its property without due process of law, in violation of the 14th amendment to the Constitution of the United States and Section 2 of Article II of the Constitution of Illinois;

4th. It denies to this defendant the equal protection of the laws in violation of the 14th amendment to the Constitution of the United States;

5th. It is a taking of the private property of this defendant without just compensation, in violation of Section 13 of Article II of the Constitution of Illinois;

6th. It is a special law laying out or opening a highway in violation of Section 22 of Article IV of the Constitution of Illinois.

7th. It is a special law affecting only property in and along the Desplaines River and not affecting other property similarly situated upon other streams, and is in violation of Section 22 of Article IV of the Constitution of Illinois.

This defendant admits that Charles S. Deneen is

204 the Governor referred to in said statute, but denies that he, by virtue and reason of said statute and the direction therein contained, or by virtue of his office as Governor and his constitutional duty to take care that the laws be faithfully

dant's ibit I.

executed, or otherwise, has a special, or any, interest in the matters therein set forth.

Defendant denies that the Desplaines River has from the time when said ordinance of 1787 was passed, or from any other time, unto the present time or unto any other time, formed in its ordinary condition and by itself to the extent of its course, or otherwise, from the point of said alleged portage and connection with the Chicago River, or from any other point, to its mouth in Grundy County, or to any point or extent, a continued highway with water in sufficient volume and of sufficient depth to afford a channel for navigable and commercial purposes.

This defendant denies that the said Desplaines River from near the City of Chicago to the mouth of said river in Grundy County, or from any point to any other point, has been from the earliest knowledge of said river until the present time, or at any time, in law or in fact a navigable river, and denies that the several acts of the Legislature recited in said bill of complaint show the fact so to be, and denies that it is a fact, that it has been, or is the policy of the State to hold and maintain said Desplaines River to be a navigable river, and denies that said river is subject to the provisions of the several acts of Congress set forth in said bill, and denies that by reason of said acts the said Desplaines River has been, or
205 still continues to be, a highway of commerce, or that it is preserved for the use of the people of the State of Illinois, or the people of all the States of the United States, as a public highway; denies that it has not been alienated, and denies that the people of the State of Illinois have an easement over said river as a public highway for commerce, or otherwise, or that said river or the bed and waters thereof are permanently, or otherwise, impressed or burdened with said alleged easement or with a public right or public use of navigation, or otherwise, but this defendant alleges that on the contrary thereof there has never at any time been any navigation on said river of any kind or character and that said stream from its source to its mouth throughout its entire course is in fact incapable of being navigated.

Defendants avers that the said Desplaines River in its original or natural state or condition had not sufficient water for more than fifteen days in the year to float a canoe, and was not navigable in fact and was not capable of being navigated for purposes of commerce; that there never has been any navigation of said river for useful or commercial purposes; that from the point where the said river crosses the state line

between Illinois and Wisconsin, to the mouth of the stream said stream is a series of pools and shallows, and more nearly resembles a brook or rivulet than a river.

Defendant further avers that from Lockport to the mouth of the Desplaines River, a distance of about 18 miles, there is a fall of 90 feet, an average of 5 feet per mile; that approx-
206 imately one-half the distance is composed of rapids and riffles; that between Lockport and Brandon's bridge, a distance of 7 miles, there is a fall of 34 feet, or about 4.6 feet per mile, and that between Jackson street and McDonough street, in the City of Joliet, a distance of 5,000 feet, there is a fall of 9 feet,—an average of 1.8 feet per thousand feet or over 9.5 feet per mile; and from McDonough street to Brandon's bridge, a distance of 2,000 feet, there is a fall of 3.75 feet or 9.9 feet per mile, and that along Treat's island, for a distance of 2,000 feet, there is a fall of 5.5 fet, or over 14.52 feet per mile, and that below that point, at a point called Smith's bridge, in a distance of 3,000 feet, there is a fall of 2 feet, or 7.92 feet per mile and that at Dresden Heights, where the dam of this defendant is being constructed, in a distance of 2,000 feet, there is a fall of 3.2 feet or 8.44 feet per mile; that from Jackson street, in the City of Joliet, to Brandon's road, a little over 2 miles, in the first 5,000 feet there is a fall of 9 feet, in the next 2,000 feet there is a fall of 3.75 feet; in the next 2,000 feet there is a fall of 5.5 feet, and in the next 3,000 feet there is a fall of 2 feet, making, in a distance of 12,000 feet, 20.25 feet fall, or an average of 8.91 feet per mile.

And defendant further avers that during times of freshets or high water which usually last only for very short periods varying from one day to two weeks, the current over said slopes is so swift that no boats could descend the river except at imminent peril to life and property, and that it would be wholly impossible for boats of any description carrying merchandise or otherwise, to ascend such river at such times.

Defendant avers that various dams and bridges have
207 been erected over said stream as hereinafter set out, all of which were constructed without legislative authority.

That in 1833 a dam known as Beard's Dam was constructed across said Desplaines River near the mouth thereof, in Section 25, Township 34 North, Range 8, East of the Third Principal Meridian, in Grundy County, at substantially the same place where defendant is constructing its dam, without any provision therein for the passage of boats, and that said dam was maintained at said location for many years without an

dant's hibit I.

provision therein for the passage of boats of any kind or size, and that in fact no boats ever could or did pass through, over or around said dam.

That in 1835, or prior thereto, there were dams located across each channel of said Desplaines River in section 11, township 34 north, range 9, east of the third principal meridian and that said dams remained in said river many years.

And this defendant avers that said two dams last above mentioned were located upon odd-numbered sections, through which sections the state now claims that the shore and the bed of said stream were reserved from sale; and defendant avers that the said dams were constructed by the owners of the lands adjoining said stream upon either side, and were so constructed as an exercise of the right of ownership and dominion of and over the shores of said stream and the land in the bed thereof.

That in 1839 there was a dam built across the Desplaines River near what is now McDonough street in the City of
208 Joliet, which is sometimes called the Adam dam and sometimes Malcolm's dam, and that said dam remained in said river from said date until 1898 when it was removed by the Sanitary District of Chicago upon its paying as damages therefore a sum upwards of $80,000.

That in the summer and fall of 1833 there was a dam built entirely across the river just south of what is now Cass street in the City of Joliet, which said dam remained in said river until 1841, when it was removed by the State of Illinois upon its paying as damages therefor the sum of $17,655.

And defendant avers that said dam was constructed in said stream by the owner of the land abutting upon both sides of said stream and was so constructed by him in the exercise of dominion and ownership over the land abutting upon said stream and in the bed thereof; and defendant avers that if said Desplaines River was at the time of the removing of said dam a navigable stream, and the said dam was an obstruction to the navigation thereof, the said dam was in said stream without right or authority, and that the state could have removed said dam as a purpresture, without the payment of any damages therefor; and defendant avers that the action of the state in paying said damages was an admission that said stream was not navigable and that said dam was lawfully in said stream.

That in 1833 a dam known as Norman's dam, opposite where the state penitentiary is now located, was built across one channel of the Desplaines River.

That prior to 1839 there was a dam known as Daggett's dam built entirely across the river at Lockport.

209 That prior to 1847 there was a dam constructed across the Desplaines River in Lake County, Illinois, extending entirely across the river.

And this defendant avers that there were no provisions in any of said dams for the passage of boats, and that in fact no boats could or ever did pass any or either of said dams.

This defendant further avers that for many years there were no bridges across the Desplaines River, but that the river was forded at many points, and that afterwards bridges were established and are now located at the following points:

Smith's bridge in section 21, township 34 north, range 9, east of the third principal meridian;

The bridge known as the Millsdale bridge, located in section 11, township 34 north, range 9, east of the third principal meridian, near Millsdale in Will County, and that said bridge and the abutments thereof were constructed upon and over the shore and bed of the stream as an exercise of ownership and dominion over said land.

The bridge now known as Brandon's bridge, located in section 30, township 35 north, range 10, east of the 3rd P. M.;

Six bridges in the City of Joliet: one known as the McDonough street bridge, crossing the river at McDonough street, in Joliet; the Chicago, Rock Island & Pacific R. R. Co.'s bridge just north of McDonough street; the bridge across the river at Jefferson street; one at Cass street; one at Jackson street, and one at Ruby street in Joliet.

210 That there is also a bridge across the river in the township of Lockport, on the Lockport highway.

And this defendant avers that all of these bridges above mentioned are fixed bridges and have no provision for the passage of boats, and that boats cannot pass said bridges or any or either of them.

This defendant further avers that no legislative permits were ever granted by the State for the erection of any of the dams hereinabove enumerated, or for the location of any of the bridges hereinabove enumerated.

That in 1846 the State of Illinois completed the dam known as dam No. 1, entirely across the said Desplaines River, forming what is known as the Upper Basin of the Illinois and Michigan Canal, which dam is now in existence.

And that in 1841 the State of Illinois built the dam known as dam No. 2 in the vicinity of what is now Jefferson street, Joliet, extending entirely across the said Desplaines River

ant's bit I.

and forming the pool known as the Lower Basin of the Illinois and Michigan Canal; that said dam No. 2 remained in said river from 1841 until 1899, when it was removed by the Sanitary District of Chicago by and with the consent of the Canal Commissioners.

This defendant avers that by stipulation filed in the case of Haven v. The Board of Trustees of the Illinois and Michigan Canal in the Circuit Court of Will County, tried at the October term, 1848, of that court, it was admitted by the Canal Trustees that the Desplaines River was not navigable in
211 fact, although a portion of it had been declared to be so by act of the Legislature.

Defendant avers that in a proceeding brought in the Circuit Court of Will County, Illinois, by the Sanitary District of Chicago against William J. Adams, the dam hereinabove referred to as the Haven dam, together with the water-power rights connected therewith, was taken by said Sanitary District by virtue of the Eminent Domain Law of the State of Illinois, and the said Circuit Court in said proceedings adjudged and decreed that the defendants in said case had a valuable property right in the said dam, and the water-power thereby created, and awarded said defendants a large sum as compensation therefor, and for other property connected therewith, and that said case was, on appeal, affirmed in the Supreme Court of Illinois; and this defendant avers that said judgment of the said Circuit Court and said affirmance in the Supreme Court were in effect a finding that said dam was lawfully in said stream, and that no easement of navigation or otherwise existed therein.

This defendant admits that by act of Congress approved March 2nd, 1827, there was granted to the State of Illinois, every alternate section in a strip of land ten miles wide along the line of the Illinois and Michigan Canal "for the purpose of aiding the opening of a canal to connect the waters of the Illinois River with those of Lake Michigan," as is alleged in paragraph V of said bill, and admits that among the lands thus conveyed by Congress, was section 25, in Township 34 north, range 8, east of the third principal meridian, in Grundy County, Illinois.

212 This defendant admits that the Desplaines and Kankakee Rivers unite and form the Illinois River in the southeast quarter of said section 25, but denies that by the survey of public lands by the United States said Desplaines River was meandered, and denies that the purchasers from the State of Illinois of lands in said section 25 or in other

similarly situated land with reference to the Desplaines River, did not take, or did not claim to take, under their several purchases, that portion of said lands lying between the alleged meander line of the Desplaines River and the waters of said river, and denies that said land between said alleged meander line and the waters of said river have never been used by any individual under any claim of authority or right vested in the purchasers of said lands from the State, save and except as claimed by the defendant. Defendant's Exhibit

Denies that the land lying between the alleged meander line of the Desplaines River and the waters of said river in the southeast quarter of said section 25, together with the bed of the stream of the said Desplaines River in said quarter section of land last above described or in other lands similarly situated with reference to the Desplaines River, or either or any of such lands, have not passed by purchase from the State of Illinois, and denies that the same, and each and every or any part thereof, is owned by the State of Illinois, or held by the State for the use and benefit of the people of the State or the people of the United States as a public highway for commerce, or otherwise.

But, on the contrary thereof, this defendant alleges that the purchasers from the Board of Trustees of the Illinois and Michigan Canal of lands donated to the State by the 213 United States for the purpose of aiding in the opening of a canal to connect the waters of the Illinois River with those of Lake Michigan, did by virtue of their several deeds and purchases, acquire all the right, title and interest of the State in and to all of the land described in their respective deeds, including the land between the alleged meander lines and the waters of streams running through said lands, and in the beds of said streams, and have always claimed title thereto, and that their title to the lands between the alleged meander lines and the waters of said streams and in the beds of said streams have always been recognized, and that the lands between said alleged meander lines and the banks of said streams have been used and cultivated by the purchasers of the lands through which said streams pass down to the banks of such streams, without reference to any alleged meander lines, from the dates of their respective purchases to the present time.

And this defendant admits that the trustees of the Illinois and Michigan Canal executed and delivered to one Charles E. Boyer, a deed bearing date the 22nd day of October, 1860, for the south fraction of the northwest quarter and the north fraction of the southeast quarter and the north fraction of

ndant's hibit I.

the northwest quarter, and the south fraction of the southeast quarter of said section 25, in township 34 north, of range 8, east of the third principal meridian, excepting and reserving so much of said tract as was occupied by the canal and its waters, and a strip 90 feet wide on either side of said canal, said tract containing 196.62 acres and being a portion of the land granted by the United States to the State of Illinois
214 to aid said State in opening a canal to connect the waters of the Illinois River with those of Lake Michigan, and by said State granted to said Board of Trustees of the Illinois and Michigan Canal for the purposes set forth in the act of said State, of February 21st, 1843.

And this defendant denies that no part of the land in the northwest quarter and in the southeast quarter of said section 25, situated outside of the alleged meander line of the Desplaines River, were conveyed by said deed of the Board of Canal Trustees to said Charles E. Boyer, and denies that the same remained the property of the State of Illinois; but, on the contrary thereof, this defendant avers that said deed from the Board of Trustees to said Charles E. Boyer was a conveyance by said trustees to said Charles E. Boyer of all the lands belonging to the State of Illinois in the subdivisions therein described, including the land situated outside of said alleged meander line, and the land lying in the bed of the stream of the Desplaines River, and that the title to all of said lands passed to the said Boyer by virtue of said conveyance.

This defendant admits that its claim to said premises so situated outside of the alleged meander lines of the Desplaines River in said section 25, is based upon mesne conveyances from the said Charles E. Boyer, and the several leases and contracts attached to said bill.

Defendant admits that on March 2nd, 1827, Congress passed an act entitled "An act to grant a quantity of land to the State of Illinois for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of
215 Lake Michigan," as alleged in said bill, and that said act provided that "the lands shall be subject to the disposal of the Legislature of the said State for the purpose aforesaid and no other."

This defendant admits that by the act of March 2nd, 1827, Congress granted by implication the right of way for the construction of said canal through the sections of public land which were not donated to the State, and that the said grant of right of way by implication extended to the land necessary to be used for the canal of the width contemplated.

Defendant's Exhibit I.

The defendant further admits that afterwards such proceedings were had pursuant to law and said statute, that the route and location of the canal were duly surveyed and laid out, and the odd-numbered sections of land upon the survey of the same duly selected by the commissioner of the land office, as alleged in said bill.

Denies that Artemus J. Mathewson, under the authority and direction of the Canal Trustees, surveyed and marked lines of a 90-foot strip on each side of the canal as finally located and constructed, from one end of said canal to the other, or that he filed in the office of said Board of Trustees maps and profiles of said survey and of said 90-foot strip; and denies that he had any lawful authority so to do.

Admits that a strip of land ninety feet in width on each side of the canal as aforesaid, was reserved from the sale by the Canal Commissioners and the Canal Trustees in many of the sales of canal lands in odd-numbered sections, and that the title thereto remains in the State of Illinois, but denies that said strip, together with the lands necessary
216 for the right of way through the alternate even-numbered sections of said land through which said canal is constructed, constitute integral parts of the canal, or that they are necessary for its preservation and use, or that they are by law preserved and protected against alienation, but on the contrary thereof avers that said Canal Commissioners are expressly authorized by law to sell and convey any portion of said 90 foot strip excepting such portions thereof as are now utilized in connection with the use of water power upon the said canal or the sale of which would prevent or interfere with the proper use and operation of the said canal as a waterway, but admits that the 90-foot strip was expressly reserved from sale in said deed of the trustees of the Illinois and Michigan Canal to said Boyer.

Defendant believes that the exhibits attached to said bill are substantially accurate copies of the originals of which they purport to be copies, but it does not admit that they are true copies.

This defendant admits that the Canal Commissioners of the State of Illinois entered into a certain contracts bearing date the 2nd day of September, 1904, with one Harold F. Griswold, a purported copy of which is attached to said bill and marked Exhibit 9, and admits that the said contract was assigned by the said Harold F. Griswold to this defendant.

This defendant further admits that the said Canal Commissioners entered into a contract of lease with one Harold F.

dant's ibit I.

Griswold as of the date of September 2, 1904, copy of which is attached to said bill and marked Exhibit B, and admits that said Harold F. Griswold assigned the said contract to this defendant.

217 This defendant further admits that the Canal Commissioners entered into another certain contract with Harold F. Griswold, as of the date of the 8th of August, 1905, a purported copy of which is attached to said bill and marked Exhibit C, and admits that said Harold F. Griswold assigned the said contract to this defendant.

This defendant admits that said Canal Commissioners made an application to the Governor of the State of Illinois for his consent to the sale of certain lands, which application bears date the 11th day of June, 1904, a purported copy of which is attached to said bill and marked Exhibit D, and that a purported copy of the approval of said application by the Governor as of the 14th day of June, 1904, is attached to said bill, marked Exhibit E.

This defendant admits that a certain notice of proposed sale was inserted in the Lockport "Phoenix Advertiser," as is alleged in said information, but that the sale so advertised to be made was adjourned and never thereafter resumed.

Defendant further admits that after the 2nd day of August, and under date of September 2, 1904, the Canal Commissioners entered into the agreement and lease hereinabove mentioned respectively as Exhibits A and B, and that afterwards, and under date of November 1, 1904, the Canal Commissioners of the State of Illinois made an application to the Governor for his consent to the sale of certain lands described in said application, a purported copy of which is attached to the bill, marked Exhibit G, and that the approval of said

218 application for sale by the Governor was made in writing, a purported copy of which, bearing date the 2nd day of November, 1904, is attached to said bill, marked Exhibit H; that pursuant to said application and approval, notice of sale was inserted in the Lockport "Phoenix Advertiser," as alleged in said bill.

Defendant admits that pursuant to said application last above mentioned, and the appoval of the Governor thereof, and of the advertisement in the Lockport Phoenix Advertiser last above mentioned, the said Canal Commissioners sold the lands therein mentioned, and executed a certain deed to Harold F. Griswold as of the date of January 5, 1905, a purported copy of which deed is attached to said bill marked Exhibit J,

and admits that said Harold F. Griswold conveyed said premises so that by mesne conveyance said premises passed to this defendant. Defendant's Exhibit

This defendant further admits that said Canal Commissioners entered into a contract of lease with Harold F. Griswold as of the date of December 2, 1904, a purported copy of which is attached to said bill and marked Exhibit K and made a part thereof, and that said lease was assigned by Griswold to this defendant.

This defendant admits that by virtue of the several deeds, leases and contracts mentioned in said bill, and also by virtue of its ownership of the bed and shore of the Desplaines River, it claims a right to construct a dam across the Desplaines River and across the lands adjacent thereto, and across the 90-foot strip of land, and immediately adjoining the waterway of said Illinois & Michigan Canal and up to the bank or towpath of the said Illinois and Michigan Canal, and to
219 construct said dam so as to flood the lands along the Desplaines River for a distance of several miles above the location of said proposed dam, and on the southeast quarter of said section 25, but denies that said 90-foot strip of land is used for canal purposes, and avers that said 90-foot strip of land through said southeast quarter section has not heretofore been used for any purpose whatsoever either by the Canal Commissioners or by any one pursuant to the authority granted by them, or otherwise, and that said land was swampy, unfit for cultivation, partially covered with water, and unproductive of revenue.

This defendant further avers that during the year 1904, one Charles A. Munroe and associates acquired, in connection with the land purchased and leased from the Canal Commissioners under the various instruments from the said Canal Commissioners to Harold F. Griswold, referred to in said bill, by purchase from the owners thereof, some 1,800 acres of other lands, at an expenditure of upwards of $200,000, the ownership of which gave to said Munroe and associates the right to construct a dam at the mouth of the Desplaines River with a crest at such a height as would back the level of the waters of the Desplaines River to the level of the waters of Lake Joliet, and defendant avers that at the time of the making of said leases, deeds and contracts, the said Canal Commissioners knew that the said Munroe and associates had acquired and were acquiring a large amount of other lands at a large expenditure of time and money, for the purpose of utilizing the same in connection with the lands so acquired from

dant's bit I.

said Canal Commissioners, for the purpose of creating water power.

220 Defendant avers that before the beginning of the construction of its said dam and in order that said dam might be located at such a point as would contribute to a waterway, if one should ever be constructed in said stream, one Charles A. Munroe submitted the plans of said proposed dam to said War Department, of the United States, and requested that said Department would give some expression of opinion as to whether the plans submitted would be in harmony with the work of improvement proposed by the United States Government, to-wit, the construction of a navigable waterway from Lockport, Illinois, to St. Louis, Missouri, via the Desplaines, Illinois and Mississippi Rivers, and that thereupon the Chief of Engineers of the United States Army referred the matter to Lieut. Col. W. H. Bixby, of the Corps of Engineers of the United States Army, in charge of the district in which said proposed work was to be constructed, to examine said plans and said proposed work and to report his recommendations thereon; that thereupon the said Bixby reported to the Chief of Engineers of the United States Army as follows:

of H. Bixby, Mar. 1906.

"United States Engineer Office,
508 Federal Building,
Chicago, Ill., March 27, 1906.

Brig. Gen. A. Mackenzie,
Chief of Engineers, U. S. Army,
Washington, D. C.

General:

I. In reply to Department letter (E. D. 58726) dated March 16, 1906, as to the proposed plans of a water power company for a dam across the Des Plaines River, Ill.,

221 just above its mouth, which have been verbally and informally presented to your office by the Hon. H. M. Snapp and the water-power representatives, I have herewith to submit report as follows:—

2. The dam in question is that proposed by Chas. A. Munroe, of Chicago, Ill., as explained by his letter to this office under date of March 20, 1906, with inclosures (copies herewith—2 letters, 3 blue-prints). (5 incls.)

3. The Des Plaines River, so far as now known to this office, has never yet been considered a navigable stream of the United States. It is therefore apprently as yet subject only

to such jurisdiction as applies to all other unnavigable streams and not subject to the provisions of Sections 9-13, Act of March 3, 1899, or to other similar U. S. legislation.

Report of W. H. dated 27, 19

4. The agents of the water power company in question, informally claim to have secured possession of all the land on each bank of the river necessary to allow for construction of the dam and of its accessories, and to protect themselves from all future claims for over-flowage created thereby, so far as any existing known rights are concerned, and the likewise claim that there is no existing State law, or United States law which prohibits their legally going ahead with their proposed construction and that no special law is needed therefor. They admit, however, that in some minor matters, they still lack necessary authority from the local Board of Supervisors, to condemn certain properties which they still wish to acquire in order to facilitate or simplify their future work (such permission, however, not being absolutely essential to such work) and they state that the Board of Supervisors are willing to grant such authority as soon as it is evident that the proposed power dam construction will not interfere with the future development of the river for navigation purposes.

222 5. The water power company agents likewise state that their object in bringing the matter up before the War Department at present, is to make evident that the proposed dam construction not only does not conflict with any existing U. S. law, but also will assist rather than injure the possible future navigation of the Desplaines and Illinois Rivers, should the improvement of such rivers ever be authorized by Congress in the manner proposed by the last Board Report of August 26, 1905, upon the feasibility and cost of a navigable waterway from Lockport, Ill., to St. Louis, Mo., via the Desplaines, Illinois, and Mississippi Rivers (House Document No. 263, 59th Congress, 1st Session); and they desire to secure from the War Department some expression of opinion, informal or otherwise, so far as it can properly be given, that will allow them to assure all inquirers that the War Department so understands the situation, and is making no objection to such prompt progress of the work as is necessary to a business enterprise of its magnitude and importance.

6. Paragraph 17 of the Board Report of August 26, 1905, above referred to, specially stated that the plan submitted by the Board was "not designed to develop water power, but there will probably be no difficulty in modifying it so as to

rt of
. H. Bixby,
ed Mar.
, 1906.

confirm to such development if those who are to benefit thereby will co-operate with the Government. They should pay the cost of the dams, and the damage from flowage, which is no more than they would be compelled to do if the Government made no improvement." The plans herewith submitted by Mr. Munroe show plainly a proposed co-operation such as that described in the above Board report, offered in such manner as not only to pay the cost of this power dam, and to protect the United States against flowage damage, but also to lessen by one the number of locks and dams necessary for future navigation and to otherwise save both time and money ($142,385 in first cost, and $4,000 annually thereafter for maintenance and operation) to the United States, in
223 case Congress should finally decide to undertake the improvement covered by the August 26, 1905, Board report, or to otherwise make this river navigable in this neighborhood. All information, so far received by this office, appears to substantiate the statements of Mr. Munroe, as described above; and I consider that his proposition should be encouraged and that he should receive from the War Department whatever expression of favorable consideration may be proper and allowable under such circumstances.

7. I have carefully considered the question of this power dam project and have talked it over at intervals with Mr. Woermann, while he was Assistant Engineer in local charge of the Illinois River survey under this office before he had been employed by Mr. Munroe, as well as since that time, and have discussed the matter also with Mr. Munroe; and I believe that the provisos of the next paragraph below are fair and advantageous to both sides, and will leave to the future only the question of regulating pool levels so as to avoid a conflict between depths of water needed for navigation and heads of water needed for power purposes, and so as to divide up the river water between the two according to such rights as may exist when the river shall become a navigable water (which it appears not to be at present), and when the United States shall decide to give up the use of the canal and to assume the improvement of the river. Until such time, I do not see how the War Department can assume any definite jurisdiction of the Desplaines River or make any definite demands upon any water-power company already organized for the use of this river. It is my present understanding that these provisos will be accepted by Mr. Munroe.

8. I have therefore to recommend that the Hon. H. M. Snapp and Mr. Charles A. Munroe be informed that the War Department will waive any and all objections which it may have to the progress of such water power dam construction as proposed by Mr. Munroe's letter of March 20, 1906, 224 and its inclosures, provided that he, on the part of the power dam owners, agrees

Report o W. H. dated 27, 190

(a) that he will construct and maintain in good repair, just above the mouth of the Des Plaines River, in location as approximately shown on the blue prints, a dam and spillway sufficient to hold the water surface of its upper pool at a height equal to the present mean level of Lake Joliet (taken at 512.0 feet, Memphis datum); and later whenever Congress shall have ordered the improvement of the Des Plaines River for navigation purposes, will raise this dam 3.0 feet higher (giving pool level of 515.0 feet, Memphis datum) if the War Department shall so order; and will grant the United States the use of such pool so far as needed for navigation;

(b) that he will assume the cost of, and protect the United States from, claims for all flowage damages caused by this dam between its site and the north line of Section 11, Township 34, Range 9 East, which line is about 1.5 miles by river above the next higher lock and dam proposed by the Board report (i. e., Lock No. 4 and Dam. No. 2, at the foot of Treat's Island;

(c) that he will grant to the United States a strip of land at least 150 feet wide across the north end of this dam, to be so located between it and the tow path of the present Illinois and Michigan Canal, as to connect the present mid river above, to the same below, in the manner approximately indicated on the accompanying blue prints; such strip to be used by the United States for the construction and maintenance of a boat lock, its necessary approaches, and other purposes of navigation;

(d) that he will do all the above, free of cost to the United States;

Provided, that the War Department will waive any and all objections which it may have to the progress of such water power dam construction.

Very respectfully,

W. H. BIXBY,
Lt. Col., Corps of Engineers."

225 that thereupon the Chief of Engineers of the United States Army concurred in said recommendation and reported the result of his findings and his recommendations to the Secretary of War, and thereupon and on or about the 7th day of June, 1906, the War Department, by Robert Shaw Oliver, Assistant Secretary of War, send to said Charles A. Munroe, a letter reading as follows:

1906. "War Department,
Washington, June 7, 1906.

Sir—

In reply to your letter of June 5, 1906, addressed to the War Department, in the matter of the construction by yourself and associates of a dam and spillway across the Desplaines River near its mouth, at the location and as shown on maps submitted, with your letter of March 20, 1906, addressed to Lieutenant Colonel W. H. Bixby, Corps of Engineers, U. S. Army, I have the honor to advise you as follows:

It is understood that yourself and associates are willing to comply with the following conditions, viz.:

First. That the details of construction shall be such as to insure permanency and of sufficient capacity to hold the water surface of its upper pool at a height equal to the present mean level of Lake Joliet (taken at 512.0 feet Memphis datum); and later whenever Congress shall have ordered the improvement of the Desplaines River for navigation purposes, the dam shall be raised by you and your associates 3.0 feet higher (giving pool level of 515.0 feet, Memphis dateum), if the War Department shall so order; the United States and the public to have the free use of such pool so far as needed for navigation purposes, and the use of water for power purposes shall be so limited that the level of the
226 pool shall at no time be reduced below that adopted for navigation in the plans of the United States for the slackwater improvement of the river.

Second. That the United States shall be protected from claims for all flowage damage caused by the dam between its site and the north line of section 11, township 34, range 9 east, which line is about 1.5 miles by river above the next higher lock and dame proposed by the board of engineers' report (i. e., Lock No. 4 and dam No. 2 at the foot of Treats Island).

Third. That there shall be conveyed to the United States free of cost a strip of land at least 150 feet wide across the north end of this dam, to be so located, between it and the tow path of the present Illinois and Michigan canal, as to con-

nect the present mid-river above to the same below in the manner approximately indicated on the accompanying blue prints; the right of the United States to enter upon and use such strip of land for the construction and maintenance of a boat lock, its necessary approaches, and for other purposes of navigation, if it so desires, without liability for damages resulting in any way from its operation in connection with construction or maintenance of said lock and appurtenant works to be duly guaranteed. Letter, June 7.

If these conditions are complied with, in the opinion of the Chief of Engineers, U. S. Army, concurred in by this department, the work proposed is in general harmony with the work of improvement recommended by the Board of Engineers appointed under authority of the River and Harbor Act of June 13, 1902 (32 Stat. L., 331, 364), in its report dated August 26, 1905, printed as House Document No. 263, 59th Congress, first session.

Inasmuch, however, as Congress has not as yet authorized the improvement of this river, this department does not
227 deem it expedient to take further and definite action in the matter of approving the plans.

Very respectfully,

ROBERT SHAW OLIVER,
Assistant Secretary of War.

Mr. Charles A. Monroe,
The Rookery, Chicago, Illinois."

And defendant avers that afterwards, to-wit, on or about the 15th day of December, 1906, this defendant acquired from the said Munroe and associates, all the lands and rights so acquired by them, including the leases, deeds and contracts from the said Canal Commissioners to said Griswold, set forth in said bill, and that at the time it so acquired the said lands and rights it paid full consideration therefor without any notice or knowledge of any claim that the said leases, contracts and deeds from the said Canal Commissioners to the said Harold F. Griswold were invalid, and that at said time, and before the payment of the consideration therefor, the said Canal Commissioners had knowledge that this defendant was so acquiring said lands and rights.

This defendant further avers, and states the fact to be, that after said lands were so acquired by it, it immediately entered in and upon the work of constructing its dam at the mouth of said Desplaines River, procured complete plans and drawings of the proposed work, and entered into a con-

t's
t 1.

tract for the construction of said dam at a cost of upwards of $500,000, and entered into a contract for the purchase of hydraulic machinery to the amount of $145,000, upon which it has already paid the sum of $52,500, and has become liable for the balance thereof, and defendant avers that the
228 State of Illinois, with knowledge that this defendant was proceeding with the construction of its said dam at great expense relying upon the validity of said deeds, leases and contracts, having stood by and permitted this defendant to make large outlays of money and incur heavy liability in and about the construction of its said dam, without protest or notice that it claimed that said leases, contracts and deeds were invalid, is now estopped to claim that they are invalid; but defendant denies that said several leases, deeds and contracts are ineffectual to confer any right to build or maintain said dam, but avers that said leases, deeds and contracts confer upon this defendant, full right, power and authority to construct and maintain said dam.

And defendant further avers that the earthen portion of said dam which occupies the space between the power-house and the Illinois and Michigan Canal, and which said space is reserved for the construction of a lock, has been entirely completed; that the space between said earthen dam and the Desplaines River has been excavated to a depth of, to-wit, 20 feet, and that from the north bank of said Desplaines River to the center, a distance of 500 feet, the river has been enclosed in a coffer dam; that in connection with said work, the said contractor has erected some 17 buildings, and has, and had on the ground at the time the injunction was issued in this case, engines, derricks, cars, boats, stone, cement, lumber, and material, to the amount of $150,000.

And defendant avers that the plans upon which it was proceeding to construct its said dam at the time of the enter-
229 ing of the temporary injunction herein were the same plans which were so submitted to the War Department and defendant avers that it proposes and intends to construct its said dam in accordance therewith; that it proposes to build its dam of such details of construction as shall insure permanency and of sufficient capacity to hold the water surface of its upper pool at a height equal to the present mean level of Lake Joliet (taken at 512.0 feet Memphis datum); and that whenever Congress or the State of Illinois shall authorize and undertake the improvement of the Desplaines River for navigation purposes it proposes to comply with all the conditions

specified in said letter to the end that its dam and works shall be in harmony with and will not obstruct such improvement.

This defendant further answering, denies that the General Assembly of the State of Illinois, has, by resolution duly passed by the Senate, and concurred in by the House of Representatives, on the 16th day of October, 1907, a purported copy of which is attached to said bill, proposed the building of a deep waterway, commencing at the southern end of the Chicago Drainage Canal and extending southwesterly along the line of the Desplaines and Illinois Rivers in accordance with plans and specifications formulated by the corps of engineers of the U. S. Army under and by direction of a certain act of the Congress of the United States; but avers that the General Assembly did by said resolution propose to submit to the electors of the State of Illinois a proposition to amend the Constitution of said State in the manner stated in said resolution, but defendant admits that in case a deep waterway is built in said Desplaines River, locks and dams with 230 special provisions for navigation, and securing and safeguarding the passage of boats will necessarily be constructed across said deep waterway in the channel of the Desplaines River at or near the location of the site of this defendant's dam, and that such a dam would afford water power of great value; but denies that any water power which might be created thereby will be lost to the State of Illinois if defendant shall be permitted to construct the dam herein mentioned, but, on the contrary thereof, this defendant avers that the state has no water power or right or title thereto upon the said southeast quarter of section 25; but this defendant avers that the water power existing upon the southeast quarter of said section 25 belongs to this defendant, and that the legislature of the State of Illinois has no right, power or authority to create water power and no right, power or authority to take the property of this defendant for that purpose.

And this defendant avers that the act of the legislature of the State of Illinois, passed on the 6th day of December, 1907, entitled "A bill for an act recognizing the Desplaines and Illinois River as navigable streams and to prevent obstructions being placed therein, and to remove obstructions therein now existing," and the joint resolution of the General Assembly, a purported copy of which is attached to said bill and marked Exhibit L, is an attempt upon the part of the said state to take to itself, without compensation to this defendant, the water power of this defendant, and that the resolution of the General Assembly hereinabove mentioned in so far

nt's
it 1.

is it attempts to provide for the construction of a deep waterway along the Desplaines River and the creation of water
231 power therein, is a violation of the rights of this defendant in and to the bed and shores of said stream in the southeast quarter of said section 25, and is a taking of the private property of this defendant without due process of law in violation of the XIV amendment of the Constitution of the United States and section 13 of Article II of the Constitution of Illinois, and is special legislation in violation of Section 22 of Article 4 of the Constitution of Illinois.

This defendant further answering, avers that by the act of cession of the State of Virginia, of December 20, 1783, and the deed of cession of March 1, 1784, executed pursuant thereto, the State of Virginia did convey, transfer, assign and make over unto the United States for the benefit of the said states, Virginia inclusive, all right, title and claim as well of soil as of jurisdiction, which the said Commonwealth then had to the territory or tract of country within the limits of the Virginia charter, situated, lying and being to the northwest of the River Ohio, to and for the uses and purposes, and on the conditions in said act recited, among which was the condition that the states formed out of said territory should be republican states, and should be admitted members of the Federal Union, with the same rights of sovereignty, freedom and independence as the other states, and that the lands within the territory so ceded to the United States should be considered as a common fund for the use and benefit of such of the United States as had become members of the Confederation or federal alliance of the said states, Virginia inclusive, according to their several respective proportions in the general
232 charge and expenditure, and should be faithfully and bona fide disposed of for that purpose, and for no other use or purpose whatever.

And this defendant avers that the land in said section 25 hereinabove described was among the lands so conveyed by the State of Virginia to the general government; and this defendant avers that by virtue of said act and deed of cession the general government of the United States acquired and held all of the lands thereby conveyed, in trust, for the benefit of all the states of the United States, Virginia inclusive, according to their usual respective proportions in the general charge and expenditure, and had no right or au ority to use or convey said lands for any other use or purpose whatsoever.

And this defendant avers that the United States, holding

said lands in trust as aforesaid, did by its act of March 2, 1827, grant to the State of Illinois, among other lands, section 25 in township 34, range 8, east of the third principal meridian, in what is now Grundy County, Illinois for the purpose of aiding the said state in opening a canal to unite the waters of the Illinois River with those of Lake Michigan, and provided in said act that the said lands should be subject to the disposal of the legislature of the state for that purpose, and no other.

And this defendant avers that the state thereafter, by virtue of said act, held the said lands, including section 25 aforesaid, in trust for the purposes therein expressed, and no other, and that the said state had no right or authority to divert the said section 25, or any portion thereof, from the uses for which the same were granted by the United States and had no authority to retain, use or devote the bed of
233 the Desplaines through said section 25, or the lands bordering upon said stream within the alleged meander lines thereof, for any purpose other than the construction of said canal, and that the application of said lands to any purpose other than those upon which the grant was made, would be a violation of the trust upon which said lands were granted by the general government to said state, and would be a violation of the trust upon which the United States took and held said lands by virtue of the act and deed of cession of the State of Virginia above mentioned.

Defendant avers that in the year 1842, the State of Illinois, after having expended nearly $5,000,000 upon the construction of the Illinois & Michigan Canal, and finding the same far from completion; its treasury empty; the interest upon its bonds, and other indebtedness, long past due, and unpaid; a large portion of the canal lands sold, and the proceeds expended in the construction of said canal, and a large indebtedness, in addition thereto, incurred in the construction of the same; and the value of the remaining canal lands entirely inadequate at their then value to complete the canal at the estimated cost thereof, and no one willing to extend her further credit upon her own faith,—applied to some of the large holders of her canal bonds and indebtedness for a further loan for the purpose of completing the construction of said canal; and after considerable negotiations with various large holders of her bonds and indebtedness, some of those holders offered to subscribe to a loan to the state to the amount of $1,600,000 for the purpose of completing said canal upon the

nt's
it 1.

condition that the state should convey to trustees for the
234 benefit of the subscribers to said loan, all of her canal lands, town lots, water power, coal beds, stone quarries, and all of the canal property, together with all of the tolls that might be derived from transportation upon the canal, and, in addition thereto, that the state would at the next session of its legislature, adopt and establish a system of revenue by which provision should be made for the prompt and continuous payment of part of the accruing interest upon the whole state debt, and should also provide for the gradual payment of the arrears of interest then due and of such arrears as should thereafter accrue from her then inability to pay the whole interest at its exact maturity; and thereafter, pursuant to said offer, the legislature of the State of Illinois, at its session in 1843, passed an act entitled "And act to provide for the completion of the Illinois & Michigan Canal and for the payment of the canal debt," approved February 21, 1843, section 1 of which provided that for the purpose of raising a fund for the completion of the Illinois & Michigan Canal, "the Governor of this state, be, and is hereby fully authorized and empowered to negotiate a loan solely on the credit and pledge of the said canal, its tolls, revenues and lands" to be granted to the trustees as thereinafter provided, of $1,600,000.

And section 10 of said act provided that "for the purpose of placing in the hands of trustees full and ample security for the payment of said loan authorized by this act, and the interest thereon, as well as for securing a preference in the payment of such canal bonds and other evidences of indebtedness issued by this state for the purpose of aiding in the
235 construction of the Illinois & Michigan Canal, as may be owned by the subscribers to the said loan, the state does hereby irrevocably grant to the said Board of Trustees of the Illinois and Michigan Canal, the bed of said Illinois & Michigan Canal, and the land over which the same passes, including its banks, margins, towpaths, feeders, basins, right of way, locks, dams, water power, structures, stone excavated and stone and materials quarried, purchased, produced or collected for its construction; and all the property, right, title and interest of the state, of, in and to said canal, with all the hereditaments and appurtenances thereunto belonging, or in any wise appertaining; and also all the remaining lands and lots belonging to said canal fund, or which hereafter may be given, granted, or donated by the general government to the state, to aid in the construction of the said canal, and the buildings and erections belonging to the state thereon situa-

ted; the said Board of Trustees to have, hold, possess and enjoy the same as fully and absolutely, in all respects, as the state now can or hereafter could do, for the uses, purposes and trusts hereinafter mentioned."

Defendant's Exhibit

And that by section 20 of said act, the state solemnly pledged its faith to supply, by future legislation, all such defects as might be found necessary to enable the said trustees to carry into full effect the fair and obvious intent of the act.

And defendant avers that thereafter, and pursuant to said act, subscriptions were made to said loan in accordance with the said agreement to subscribe; that thereafter, and at its session in the year 1845, the legislature of the State of
236 Illinois passed an act entitled "An act supplemental to 'an act to provide for the completion of the Illinois & Michigan Canal, and for the payment of the canal debt,' approved February 21, 1843," approved March 1, 1845, section 1 of which provided that after the contract for the loan of $1,600,000 as contemplated in the act entitled "An act to provide for the completion of the Illinois & Michigan Canal and for the payment of the canal debt" should have been duly executed in all respects as was provided by the terms of the above mentioned acts as modified by the provisions of this act, and trustees were appointed as contemplated in said act, the Governor of said state should execute and deliver unto the said trustees a deed of trust of all the property mentioned in the 10th section of said act of February 21, 1843, which said conveyance should include the lands and lots remaining unsold, donated by the United States to the State of Illinois to aid in the completion of the canal, to be held in trust as in the said act stipulated; and defendant avers that thereafter the Governor of the State of Illinois did execute and deliver a deed of trust as provided in said act.

And this defendant avers that by virtue of said act of the General Assembly of the State of Illinois passed February 21, 1843, and entitled "An act to provide for the completion of the Illinois & Michigan Canal and for the payment of the canal debt," and said deed of trust said Board of Trustees of the Illinois & Michigan Canal acquired all the right, title and interest of the state in and to the lands in section 25 hereinabove described, including the bed of the Desplaines River in said section and the lands between said alleged meander
237 lines in said section, for the purpose of securing the payment of the loan authorized by said act to be made for the purpose of completing said canal, and were authorized by said act to sell said lands at public auction in lots and legal

dant's hibit I.

subdivisions, said sales to be made for cash or on credit in the manner prescribed in the act of the 9th of January, 1836.

And this defendant avers that pursuant to such authority the said Board of Trustees did sell to the said Charles E. Boyer, the south fraction of the northwest quarter, and the north fraction of the southeast quarter, and the north fraction of the northwest quarter, and the south fraction of the southeast quarter, of section 25, in township 34, north of range 8, east of the 3rd P. M., excepting and reserving so much of said tract as is occupied by the canal and its waters, and a strip 90 feet wide on either side of said canal, containing 196.62 acres, more or less, and did execute and deliver to the said Boyer their deed dated the 22nd day of October, 1860, in words and figures substantially as follows, to-wit:

dated 22, 1860.

"Know All Men By These Presents, That the Board of Trustees of the Illinois and Michigan Canal, under the authority vested in said board by the act of the Legislature of the State of Illinois of February 21, 1843, entitled, 'An act to provide for the completion of the Illinois and Michigan Canal and for the payment of the canal debt,' has sold to Charles E. Boyer the following described tract of land, to-wit:

The south fraction of the northwest quarter and the north fraction of the southeast quarter, and the north fraction of the northwest quarter, and the south fraction of the southeast quarter of section twenty-five (25) in township thirty-four (34) north, of range eight (8) east of the third prin-
238 cipal meridian, excepting and reserving so much of said tract as is occupied by the canal and its waters, and a strip ninety (90) feet wide on either side of said canal, containing one hundred ninety-six and sixty-two hundredths (196.62) acres, more or less, said tract being a portion of the land granted by the United States by the act of March 21, 1827, and the 29th of August, 1842, and the 3rd of August, 1854, to the State of Illinois, to aid said state in opening a canal to connect the waters of the Illinois River with those of Lake Michigan, and by said state granted to the said Board of Trustees of the Illinois and Michigan Canal, for the purposes set forth in said act of said state of February 21, 1843.

Know Ye Also, That the said Charles E. Boyer paid to the treasurer of said Board of Trustees the sum of one thousand five hundred and fifty-six dollars and fifty-two cents ($1,556.52), being in full payment of the purchase money for said land, and made according to the conditions set forth in the act of January 9, 1836, entitled 'An act for the construction of the Illinois and Michigan Canal.' In consideration

thereof and the premises, the said Board of Trustees of the Illinois and Michigan Canal has granted, bargained and sold, and by these presents do grant, bargain and sell unto the said Charles E. Boyer, the said tract of land above designated and described. Deed, dated Oct. 22,

To have and to hold the same, together with all right, privileges, immunities and appurtenances thereunto belonging unto the said Charles E. Boyer, his heirs and assigns, for ever.

In Witness Whereof, the said Board of Trustees of the Illinois and Michigan Canal have caused the corporate seal of said board to be affixed hereunto and the names of the president and secretary of said board to be affixed hereunto this 22nd day of October in the year of our Lord, 1860.

W. H. SWIFT,
WILLIAM GOODING,
Secretary."

239 And defendant avers that the said Board of Trustees did by their said deed convey the lands therein described to the said Boyer and that this defendant, by mesne conveyances from the said Charles E. Boyer, and by virtue of the deed of conveyance from the said Board of Trustees of the Illinois & Michigan Canal to said Boyer, acquired all the right, title and interest of the said State of Illinois in and to the said northwest quarter and the southeast quarter of section 25, excepting so much of said tract as was occupied by the canal and its waters and said 90-foot strip.

And this defendant avers that its grantors and predecessors in title have used and cultivated the land lying between the alleged meander line and the waters of said Desplaines River in said southeast quarter of said section 25 down to the bank of said river, for more than 40 years last past, during all of which time they have been in open, notorious and peaceable possession thereof, claiming title thereto in fee simple.

And this defendant avers that the taxing authorities of the State of Illinois and the County of Grundy, in the State of Illinois, have from the date of the deed from the Canal Commissioners to said Charles E. Boyer, levied state, school and county taxes upon all of said land, including the land lying between the alleged meander lines and the waters of said Desplaines River and in the bed of the stream thereof, in said southeast quarter of said section 25, and have from time to time demanded and exacted of this defendant, and defendant's grantors and predecessors in title, the payment of such

taxes, and this defendant and its predecessors in title
240 have ever since the date of the deed from said Board of Trustees to said Boyer, down to the present time, a period of forty-seven years, paid state, school and county taxes upon all of said land, including the land lying between the alleged meander lines and the waters of said Desplaines River, and in the bed of said stream, and the said State of Illinois and the people thereof are thereby estopped from claiming that the title to the lands lying between the alleged meander lines and the waters of said Deplaines River and in the bed of the stream thereof in said southeast quarter of said section 25 has not passed from the State of Illinois, or that it is not now vested in this defendant.

This defendant further answering, denies that the 90-foot strip of land along the Illinois & Michigan Canal is necessary for the proper maintenance and use of the canal, or that it constitutes a necessary integral part of said canal, and denies that the Board of Trustees and said Canal Commissioners of the State of Illinois had not the right and authority, under the law, to convey the same by deed, lease or otherwise; but, on the contrary thereof, this defendant avers that the 90-foot strip is not a part of the Illinois & Michigan Canal but is a part of the canal lands, and has been so held by the Supreme Court of this State, and that said strip has been to a large extent sold by the state, before the date of the said lease and contract of September 2, 1904.

Defendant avers that the land described in the deed from the Canal Commissioners to Harold F. Griswold, bearing date the 6th day of January, 1904, a purported copy of
241 which is attached to said bill as Exhibit J, to-wit, that part of section 31, township 34 north, range 9, east of the third principal meridian, in Will County, Illinois, lying southwest and southeast of the Illinois & Michigan Canal, and northeast and northwest of the Desplaines River (excepting a strip of land 90 feet in width on the southerly side of the Illinois & Michigan Canal and bordering thereon and continuous throughout said section 31) were canal lands and were not connected with water power upon the said canal or the 90-foot strip along the canal, and that the said Canal Commissioners had full power and authority to sell and convey the same.

This defendant avers that by mesne conveyances from the said Charles E. Boyer, it did acquire title in fee simple to the lands lying in the bed of said Desplaines River and outside of the alleged meander lines of said stream in the south-

east quarter of said section 25, and that by virtue of said contracts, Exhibits A and B, this defendant did acquire the right purported to be granted thereby, in and to the 90-foot strip of land lying between the waters of the Illinois & Michigan Canal and the said Desplaines River, and that the said deeds, leases, contracts and other agreements are valid and subsisting deeds, leases, contracts and agreements to the premises therein respectively described; and this defendant denies that by virtue of the several enactments of the Congress of the United States, and the several acts of the legislature of the State of Illinois, as set forth in said bill, the bed of the Desplaines River is owned by the State of Illinois, or that the same has not been conveyed by any deed to anybody
242 whomsoever; and denies that the lands on said section 25 last above described, and other sections of land along the line of the Desplaines River, so granted to the State of Illinois by the act of Congress hereinbefore referred to, outside of the alleged meander line of the Desplaines River, have not been conveyed by the State of Illinois nor by any other person or persons, or corporation whomsoever, having authority to so convey the same, and deny that the same remain, and are, owned by the State of Illinois; but, on the contrary thereof, this defendant avers that by virtue of the act and deed of cession of the State of Virginia, and the act of Congress of March 2, 1827, and the act of the legislature of the State of Illinois of February 21, 1843, the act of the legislature of the State of Illinois of March 1, 1845, and the deed of trust executed pursuant thereto, and the deed of the Board of Trustees of the Illinois & Michigan Canal, hereinabove referred to, and by mesne conveyances from the said Charles E. Boyer to this defendant, this defendant acquired all the said lands in the southeast quarter of section 25, township 34, range 8, east of the third principal meridian, in Grundy County, Illinois, excepting so much of said tract as is occupied by the canal and its waters, and a strip 90 feet wide on either side of said canal.

This defendant admits that it claims to be the owner of the bed of the stream of the Desplaines River and other lands of said southeast quarter of said section 25, and other lands for a distance of nine miles up the Desplaines River, which are outside of the alleged meander lines of said river, but denies that said claim is in violation of the rights and in
243 interest of the People of the State of Illinois, as alleged in said bill; and defendant avers that it has at great expense acquired lands in the bed of said Desplaines River, and

nt's
it 1.

along the shore thereof for a distance of about nine miles, including all the lands which will be flooded by its proposed dam, for the purpose of creating water power as alleged in said bill; admits that it had actually begun the erection of a dam across the said Desplaines River and across the 90-foot strip of land alleged by said bill to be reserved for the use of the Illinois & Michigan Canal, and across other lands outside of the alleged meander lines of the Desplaines River to connect with the bank or towpath of the canal, and was so constructing said dam as to cause the water to be backed up and to overflow the lands along said river for the distance of 9 miles or thereabouts, but denies that any of the lands so to be overflowed belong to the State of Illinois.

This defendant admits that on the 12th day of December, 1907, the attorney general of the State of Illinois caused to be served upon it a certain notice as is alleged in paragraph 9 of said bill, copy of which is attached to said bill, marked "Exhibit M;" and admits that it disregarded said notice as it had a right to do; and admits that after the service of said notice, it continued in the work of constructing said dam at said place in the bed of said river, as alleged in said bill; and admits that it continued such construction up until the issuance of the temporary injunction herein; but denies that the completion of said dam would be to the great impairment, or any impairment, of the easement of navigation, if any such
244 easement existed, or to the great and irreparable injury, or to any injury, of the people of the State of Illinois, but avers that in case the United States or the State of Illinois should hereafter construct a deep waterway in said Desplaines River said dam will be a distinct aid and benefit thereto, to the extent of more than $500,000.

Denies that if said dam is permitted to be erected by said defendant, it will destroy and interfere with the Desplaines River of Illinois, or for the people of the United States, and avers that its said dam does not and will not in anywise interfere with the intent and purpose of said act of the Legislature of Illinois of December 6, 1907.

Denies that it will overflow or destroy the value of lands, and the use of lands, belonging to the state, adjacent to the Desplaines River, or that it will destroy the use of the 90-foot strip of land, or that it will render the same inoperative, and a purpresture, or that it will impair the benefit of the same to said canal; denies that it will destroy a feeder of the Illinois & Michigan Canal, or that it will constitute a purpres-

ture or that the same will produce and work irreparable loss and damage, or any loss and damage to, the Illinois & Michigan Canal, or to the State of Illinois, or to the rights of the people of the State of Illinois.

This defendant further answering, admits that the agreement, Exhibit A, purports to give rights as therein set forth; but denies that each and every, or any, of the provisions of such agreement relating to such rights were beyond the
245 power of the said Canal Commissioners to grant; but avers that at the date of said several agreements, the said Canal Commissioners, had full power and authority to grant the rights and privileges granted in and by each and every of said contracts.

This defendant admits that the lease, Exhibit B, purported to convey and demise an interest in the said 90-foot strip within the area described in said lease, in that part of the canal called the Kankakee Feeder, and purported to give a right of removal to the party of the second part therein named, and purported to be made subject to said contract Exhibit A.

Admits that each of said contracts purported to be contracts on the part of the Canal Commissioners with said Griswold, his successors and assigns, but denies that by their terms they might be assigned one to one assignee and the other to another or different assignee.

This defendant admits that the said contract was so entered into between the parties thereto, with the mutual knowledge and understanding that the party of the second part, or his assignee, intended to make use of the same in erecting said dam and developing water power in the Desplaines River, but denies that the same amount to a lease of water power rights on, or of lots and lands connected with water power on the Illinois and Michigan Canal.

Admits that said lease and contract were not entered into upon notice by publication, and that they were not limited to a period of ten years, but denies that that fact was contrary to the provisions of a certain act entitled "An act
246 to revise the law in relation to the Illinois & Michigan Canal and for the improvement of the Illinois and Little Wabash Rivers," approved March 27, 1874, and acts amendatory thereof, and in particular to the provisions of clause 6 of section 8 of said statute as amended by a certain act amendatory thereof, approved June 19, 1891, in force July 1,

1891, and deny that the said lease and contract were beyond the power of the commissioners to enter into, or that the same are null and void.

This defendant denies that treating said instruments as leases of water power, they are subject to the power of the state to resume, without compensation to this defendant, the use of such water power, or that they are further subject to the power of the state to abandon or destroy the work by the construction of which the water privilege therein purported to be conferred shall have been created whenever, in the opinion of the legislature, such work shall cease to be advantageous to the state.

This defendant denies that clause 6 of section 8 of the act approved March 27, 1874, as amended by act approved June 19, 1891, applies to the premises so leased by said instrument, and avers that said act only authorizes the abandonment or destruction of works over which the state or the canal commissioners have control.

This defendant denies that the opinion of the legislature that such work has ceased to be advantageous to the state, was expressed by the statute approved and in force December 6, 1907, entitled "An act recognizing the Desplaines and Illinois Rivers as navigable streams, and to prevent ob-
247 structions being placed therein, and to remove obstructions therein now existing."

This defendant avers that said act last mentioned has no reference to any work connected with said canal, over which the said Canal Commissioners or the legislature of the State of Illinois had any authority or control.

This defendant denies that said contract was a further lease for the purpose of enabling the assignee therein to develop and create water power, but avers the same was merely a flowage contract and not necessary to be made in conformity with the provisions of the statute last above cited in reference to the Illinois & Michigan Canal.

Denies that the Kankakee Feeder was an integral part of said canal or that said agreement was beyond the power of the Canal Commissioners to make; but, on the contrary thereof, said feeder has long since been abandoned, and was wholly unnecessary for the operation of said canal.

This defendant admits that said lease, Exhibit C, contained a provision expressly reserving to the Commissioners the right to cancel the lease and to recover possession of the land,

property and rights therein demised and referred to, whenever in the judgment of the Canal Commissioners or other proper officers of the state at such time having charge of the canal property, they shall deem the interest of the state required it to re-possess and use said property for state purposes; but this defendant denies that said power of revocation and cancellation may be exercised by the legislature of
248 the state, and denies that the same was exercised by the legislature of the state by the enactment of the statute of December 6, 1904, above referred to; and denies that the exercise of the powers, privileges and rights conferred by said lease Exhibit C will constitute and create obstructions of the Desplaines River.

This defendant admits that Exhibit J purports to convey the lands therein described, and in terms includes the lands lying and being situated outside of the alleged meander lines of the Desplaines River, and that it purports to be subject to the terms of said flowage contract, Exhibit A, and said lease, Exhibit B.

This defendant denies that the lands and lots described in said deeds are lands and lots connected with the water power privileges.

Denies that Exhibits A and B purport to convey and create water power privileges.

Admits that said advertisement thereof did not designate and describe said premises as water power privileges, and did not limit the same to the term of ten years, but denies that leases of water power privileges were at the time of the execution of said lease limited by law to a term of ten years, but avers that by the sixth clause of section 8 of the act of March 27, 1874, entitled "An act to revise the law in relation to the Illinois & Michigan Canal and for the improvement of the Illinois and Little Wabash Rivers," as amended by act approved April 21, 1899, in force July 1, 1899, the Commissioners were given power to lease water power and lands and lots connected therewith for a period of twenty years,
249 and power to provide for the extension of any lease from time to time.

And this defendant denies that said contract and lease, Exhibits A and B, were beyond the power of said commissioners, or were null and void, and denies that the same were leases of water power or lands and lots connected therewith within the meaning of any of said acts, or that they were

subject to any power in the state to resume the same, or to abandon and destroy the work by the construction of which water power shall have been created, whenever in the opinion of the legislature such work should have ceased to be advantageous to the state.

And this defendant denies that the opinion of the legislature that the work ceased to be advantageous to the state was expressed by the statute, approved and in force December 6, 1907, entitled an act recognizing the Desplaines and Illinois Rivers as navigable streams and to prevent obstructions being placed therein, and to remove obstructions therein now existing.

This defendant admits that the pole lease, Exhibit K, conveyed to said Griswold, his successors and assigns, the right to maintain a line of poles along said canal from the west line of said section 25, upon which said dam has been located, to Robey street, in the City of Joliet, and from the same point in said section 25 to the west limits of the City of Morris, in Grundy County; and this defendant admits that the said lease was made upon the same day as said contract and lease, Exhibit A and Exhibit B, and admits that it was for the
250 purpose of transferring and conveying electrical energy by said proposed line of poles, but denies that it was subject to all the infirmities alleged in said bill as to said contract and lease, Exhibits A and B, or to any infirmity.

This defendant denies that said contract, deeds and leases, or either, or any of them, were entered into on an inadequate consideration; but, on the contrary thereof, avers that the consideration paid therefor by said Harold F. Griswold to said Canal Commissioners was wholly adequate and was the full value of the rights thereby granted.

Defendant avers that the granting of the temporary injunction herein without bond has resulted in irreparable injury to this defendant, and was a taking of the property of this defendant without due process of law in violation of the 14th Amendment to the Constitution of the United States, and section 2 of Article III of the Constitution of Illinois.

This defendant denies that the said complainant, the State of Illinois, or the people thereof, are entitled to the relief prayed for in said bill, or any part thereof, and prays the same advantage of this answer as if it had pleaded or demurred to said bill of complaint, and it prays that the temporary injunction heretofore issued herein be dissolved, and

that defendant be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained. Defen Exhi

CIRCUIT COURT OF GRUNDY COUNTY,

Chancery.

March Term, 1908.

The People ex rel. Charles S. Deneen and William H. Stead, Atty. Gen.
vs.
The Economy Light & Power Co.
} No. 1526.

This cause having come on to be heard on final hearing upon the pleadings and upon the depositions taken and filed herein and upon the evidence taken and heard on behalf of the parties respectively in open court and the court being fully advised and having heard argument of counsel, it is ordered, adjudged and decreed that the information or Bill of complaint herein be and it is hereby dismissed for want of equity without prejudice however to the right of the State of Illinois to hereafter claim in any future proceeding that the provisions of the lease (in said information mentioned and made Exhibit B thereof) made by the Canal Commissioners of Illinois to Harold F. Griswold under date of September second 1904 relating to the making of a renewal at the expiration of the term of said lease are void and of no effect.

Complainant excepts to the finding and decree of the court.

Whereupon the complainants pray an appeal to the Supreme Court of Illinois which is hereby allowed and time is granted and leave is given to complainants to file a certificate of evidence by September 15th, 1908 and said appeal is allowed without bond.

The President of the United States to the United States of America and Charles F. Clyne, U. S. Attorney, Greeting:

You are hereby cited and admonished to be and appear at the United States Circuit Court of Appeals for the Seventh Circuit, to be holden at the City of Chicago, in the State of Illinois, within Thirty days from the date hereof, pursuant to an order allowing an appeal entered in the Clerk's office of the District Court of the United States for the Eastern Division, Northern District of Illinois, in that certain action, No. 29,776, in which the United States of America is the complainant and appellee, and the Economy Light and Power Co. is defendant and appellant, to show cause, if any there be, why the decree rendered against the said defendant and appellant, as in the said order allowing the appeal mentioned, should not be corrected and why speedy justice should not be done to the parties in that behalf.

Witness the Honorable Kenesaw M. Landis, Judge of the United States District Court in and for the Eastern Division of the Northern District of Illinois, this 14th day of July, A. D. 1917.

KENESAW M. LANDIS.
District Judge.

Service of the within citation, and receipt of a copy thereof, admitted this 20th day of July, A. D. 1917.

CHARLES F. CLYNE.
U. S. Attorney.

IN THE UNITED STATES CIRCUIT COURT OF APPEALS Stipulat

For the Seventh District.

Economy Light and Power Company, a corporation, *Appellant.*
vs.
United States of America, *Appellee.*

STIPULATION.

It Is Hereby Stipulated between the parties, hereto, by their respective counsel, that the continuance of the narrative of John Tanner, which appears upon pages 1073 to 1078, both inclusive, of the record of proceedings upon the trial of the above entitled cause in the United States District Court for the Eastern Division of the Northern District of Illinois, and which was inadvertently omitted from the "matters introduced upon the hearing, and not appearing in the printed record" filed in said District Court pursuant to order of said court entered July 3, 1917, and copy of which is hereto attached numbered pages 11, 12, 13, 14 and 15, both inclusive, may be filed in the Circuit Court of Appeals as a part of the record on appeal in that court, and may be printed and inserted in the transcript of record in said cause immediately following the first portion of the narrative of said John Tanner ending upon page 2455 of said transcript of record.

FRANK H. SCOTT,
Attorney for Appellant.
CHARLES F. CLYDE,
CLARENCE N. GOODWIN,
Attorneys for Appellee.

United States Circuit Court of Appeals for the Seventh Circuit.

I, Edward M. Holloway, Clerk of the United States Circuit Court of Appeals for the Seventh Circuit, do hereby certify that the foregoing printed pages, numbered from 1 to 3351, inclusive, contain a true copy of the printed record consisting of four (4) volumes, filed November 15, 1917, on which this cause was heard, argued and determined in the case of Economy Light and Power Company vs. United States of America, No. 2525, October Term, 1916, as the same remains upon the files and records of the United States Circuit Court of Appeals, for the Seventh Circuit.

In testimony whereof I hereunto subscribe my name and affix the seal of said United States Circuit Court of Appeals for the Seventh Circuit, at the City of Chicago, this fifth day of May A. D. 1919.

[Seal United States Circuit Court of Appeals, Seventh Circuit.]

EDWARD M. HOLLOWAY,
Clerk of the United States Circuit Court of Appeals for the Seventh Circuit.

At a Regular Term of the United States Circuit Court of Appeals for the Seventh Circuit, begun and held in the United States Courtroom in the City of Chicago, in said Seventh Circuit, on the third day of October, 1916, of the October term in the year of our Lord one thousand nine hundred and sixteen and of our Independence the one hundred and forty-first.

And afterwards, to-wit: On the fourteenth day of August, 1917, in the October term last aforesaid, came the appellant, by its counsel, Mr. Frank H. Scott, and filed in the office of the Clerk of this Court his appearance, which appearance is in the words and figures following, to-wit:

United States Circuit Court of Appeals for the Seventh Circuit, October Term, 1916.

No. 2525.

ECONOMY LIGHT AND POWER CO., Appellant,

vs.

UNITED STATES OF AMERICA, Appellee.

The Clerk will enter my appearance as counsel for the appellant.
FRANK H. SCOTT.

Endorsed: Filed Aug. 14, 1917. Edward M. Holloway, Clerk.

2525.

ECONOMY LIGHT AND POWER COMPANY

vs.

UNITED STATES OF AMERICA.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

It is ordered by the Court that this cause be, and the same is hereby re-set down for hearing on November 6, 1918, and that appellant file a reply brief by November 1, 1918.

And afterwards, to-wit: On the sixth day of November, 1918, in the October term last aforesaid, there was filed in the office of the

Clerk of this Court a certain Motion, which said Motion is in the words and figures following, to-wit:

In the United States Circuit Court of Appeals for the Seventh Circuit, October Term, A. D. 1917.

No. 2525.

ECONOMY LIGHT AND POWER COMPANY, Appellant,

vs.

UNITED STATES OF AMERICA, Appellee.

Motion of Appellee for Leave to File Printed Answer to Reply of Appellant.

Now comes the appellee by its counsel and moves the Court for leave to file a printed answer to "Reply Brief for Appellant and Analysis of Appellee's "Synopsis of the Evidence," within such time as may be agreeable to the Court, and in the alternative for leave to file an answer to so much of said document as constitutes an "Analysis of Appellee's Synopsis of the Evidence," and for ground of such motion shows: 1. That appellant in its *prief* presents no statement, analysis, review, or synopsis of the evidence in this cause, and the burden of preparing such a review therefore fell upon appellee. The appellant devotes a large portion of its reply to criticism of appellee's review of the evidence.

Appellant's reply came into the hands of the appellee's counsel on the morning of November 3rd, and as the argument is set for November 6th at 10 o'clock, sufficient time does not intervene to permit appellee's counsel to file a printed answer.

2. In the ordinary course a review of the evidence should have been presented by appellant. This would have given appellee an opportunity to criticise and supplement it and appellant an opportunity to reply to any criticism.

3. By failing to follow this course appellant under the rules prevents appellee from replying to appellant's criticism of its review of the evidence.

Respectfully submitted,

CHARLES F. CLYNE,
United States Attorney;
CLARENCE N. GOODWIN,
Special Assistant to the United States Attorney General,
Counsel for Appellee.

Received a copy of the foregoing motion this 6th day of November, A. D. 1918, before the hour of 10 o'clock.

FRANK H. SCOTT,
Counsel for Appellant.

Endorsed: Filed Nov. 6, 1918. Edward M. Holloway, Clerk.

And afterwards, on the same day, to-wit: On the sixth day of November, 1918, in the October term last aforesaid, the following further proceedings were had and entered of record, to-wit:

WEDNESDAY, November 6, 1918.

Court met pursuant to adjournment and was opened by proclamation of crier.

Present:

Hon. Francis E. Baker, Circuit Judge, presiding.
Hon. Evan A. Evans, Circuit Judge.
Hon. Arthur L. Sanborn, District Judge.
Edward M. Holloway, Clerk.
John J. Bradley, Marshal.

2525.

ECONOMY LIGHT AND POWER COMPANY

vs.

UNITED STATES OF AMERICA.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division

Upon motion of counsel for appellee Clarence N. Goodwin, it is ordered by the Court that the appellee may file a reply brief in this cause within ten days from this date.

No. 2525.

ECONOMY LIGHT AND POWER COMPANY

vs.

UNITED STATES OF AMERICA.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

Now this day come the parties by their counsel and this cause now comes on to be heard on the printed record and briefs of counsel and on oral arguments by Mr. Frank H. Scott, counsel for appellant, and by Mr. Clarence N. Goodwin, counsel for appellee, and the Court having heard the same takes this matter under advisement.

And afterwards, to-wit: On the twenty-first day of January, 1919, in the October term last aforesaid, there was filed in the office of the Clerk of this Court the Opinion of the Court, which said Opinion is in the words and figures following, to-wit:

In the United States Circuit Court of Appeals for the Seventh Circuit, October Term and Session, 1917.

No. 2525.

ECONOMY LIGHT AND POWER COMPANY, Appellant,

vs.

THE UNITED STATES, Appellee.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

Before Baker and Evans, Circuit Judges, and Sanborn, District Judge.

December 14, 1909, the United States filed its bill of complaint against the Economy Light and Power Company alleging that said company had without the consent of Congress and without authority of the legislature of Illinois commenced the construction of a dam in the Desplaines River at a point in Grundy County, Illinois, and that the portion of the Desplaines River in which the construction of the dam had been commenced was navigable water of the United States, and praying the court to order, adjudge and decree said Desplaines River to be a navigable river and one of the navigable waters of the United States; that the portion of the dam constructed be held to be in violation of the provisions of section 9 of the Act of March 3, 1899, and ordering its removal, and that the defendants and its officers and agents and all persons acting under them be enjoined perpetually from placing any further obstruction in said river, and from doing any other act or performing any other work in connection with the construction of said dam.

On February 28, 1910, the defendant filed its answer, admitting the commencement of the construction of a dam as alleged, but denying the navigability of the portion of the Desplaines River in which said dam was being constructed. A very large amount of evidence was taken, the abstract containing 3186 printed pages.

From a decree entered May 25, 1917, perpetually enjoining the defendant, its officers, agents, &c., as prayed, defendant appeals.

Opinion by Sanborn, District Judge.

The Desplaines up to 1894. The Chicago-Desplaines-Illinois water route, used from 1673 to 1825 by explorers and in the fur trade, was made up of portions of the Chicago and Desplaines rivers, now some eight miles apart. It includes the Chicago River from its mouth on Lake Michigan to Robey street, Chicago, on the west fork of the south branch, thence westerly, by water or portage, to Mud Lake, about two miles, thence to the Desplaines near Riverside, two miles, down the river to the Illinois, made by the confluence of the Desplaines and Kankakee. The part of this route between the Chicago and Desplaines is called the Chicago divide. The Desplaines River

rises near the county line between Racine and Kenosha counties, Wisconsin, and runs in a southerly direction, parallel substantially to the west shore of Lake Michigan, through Lake and Cook counties, Illinois, until it reaches Riverside, some 11 miles from the mouth of the Chicago River; thence it takes a southerly direction through Cook and Will counties to its confluence with the Kankakee River near the east line of Grundy County. The original area of the Desplaines River basin was 1428 square miles, and with the changes which have been made the present area is taken at 1392 square miles. The Desplaines River basin is usually divided into the Upper Desplaines and the Lower Desplaines, the term Upper Desplaines applying to that portion above Riverside. The Upper Desplaines basin has an area of 633 square miles, a general length of about 60 miles, and a general width of about 10 miles, and is a true basin; has practically no true tributary basins, except Salt Creek which has about 110 miles, entering at Riverside. It is a rolling country, originally covered with one-half to one-third in timber. Its general declivity by its flood plane is about one and a half feet per mile. The river bed is cut as a groove in a prairie, rather than the ordinary river bed, with an overflow or flood plane on either side. Originally it had a considerable quantity of swamp, marsh and bog at head waters; and in Lake County and in portions of Cook County and also upon Salt Creek in Du Page County; and a lake development in Lake County from which that county derives its name.

The characteristics of the Lower Desplaines basin, that portion below Lyons or Riverside, are that it covers by the general course of the valley about 42 miles to the confluence with the Kankakee, and has a total descent of about 102 or 103 feet. It has a true sub-basin in the Du Page River which covers 366 square miles. The total area is 795 square miles below Riverside, but outside of the Du Page River this area is only 429 miles. The valley in itself is not a characteristic valley like the Upper Desplaines, but has the appearance of being an old water course or outlet from the great lakes in which the modern stream follows through remnants of an ancient stream of much greater magnitude, a succession of pools and wide expanses with intermediate channels, which have not yet developed to their proper proportions, connecting these pools and water stretches. The river valley or river has two considerable tributaries aside from the Du Page, in Hickory Creek and Jackson Creek, but otherwise the drainage is essentially marginal or shore drainage.

Beginning within a mile of the township line between Riverside and Lyons is a long level expanse known as the twelve mile level, consisting of a succession of water expanses and connecting straits or channels from 150 feet up to a quarter or an eighth of a mile in width, in places, and with varying depths up to 10 or 15 feet in localities; these water expanses having a mud bottom which seem to be more vegetable deposits than alluvial, and which indicate originally much greater depth; and margined in by a vegetable growth. These expanses were for a long time used as ice fields by the ice interests which had their market in Chicago. Below the twelve mile level is a succession of ponds and shallow connections in the rock, like Goose Lake and Round Lake, and others between Romeo and the twelve mile level. This whole stretch is well described in the

original land survey as a succession of swamps, pods, lakes and marshes connected by currents.

Below Romeo, which is 6 miles below Lyons, there is a declivity at the rate of 7 feet per mile from the Romeo highway down to the head of Lake Joliet, a distance of 11 miles, pretty uniformly distributed. Thence for a distance of about 13 miles between that and the mouth of the river there are some 10 miles occupied by pools, or Lake Joliet, which has a length of nearly 6 miles and has a width of 500 to 900 feet, and a depth originally up to 15 or 20 feet; and then a pool of over a mile in length immediately below Treat's Island rapids; then Lake Du Page, some 13 miles in length, with a width of about 350 feet on the average, and with a depth of 10 feet and upwards, these pools being connected by intermediate rapids like the one at Treat's Island and the one near the mouth of the Kankakee, and the reach of swifter and shallower water between the pool below Treat's Island and the head of Lake Du Page. These distances are given only approximately, and to show some *some* of the characteristics of the stream. This description applies to the Desplaines River as it was known up to about 1894, when the Sanitary District works changed the conditions very radically through the valley above the city of Joliet, between there and Lyons or Riverside. The proportion of the Desplaines River itself from the end of the portage road to its mouth, or confluence with the Kankakee, that would consist of pools, would be about 60 per cent. The total distance from the portage road to the confluence with the Kankakee is about 44.5 miles. In that distance there would be the so-called 12 mile level, which is 13.7 miles, Lake Joliet, the pool below Treat's Island, and Lake Du Page, aggregating 10 miles, and Goose Lake and Round Lake, and some other stretches unnamed, amounting in all to about 27 or 28 miles out of a total of 44.5. The distance from dam No. 1 to the mouth of the river is 15.72 miles, of which about 10 miles consists of pools. This stretch is now more particularly in question. The condition of these pools if the Desplaines River were to run dry, that is, no water pass from pool to pool, would be that Lake Joliet would be practically available for boats as before, the depth in it being from 20 to 25 feet at the maximum, and a large proportion of it having more than 10 feet.

The distance from Lake Michigan to the mouth of the Desplaines River is 58.32 miles, made up as follows:

From Lake Michigan to Ashland Avenue, which is substantially at the forks of the south branch of the Chicago River	5.5	miles
Ashland Avenue to Ogden dam, which is across the old portage slough, on the range line, R. 12, 13, north of Summit	8.3	
The so-called 12 mile level, actual length	13.7	
From 12 mile level to Isle la Cache	6.7	
Isle la Cache to dam No. 1	8.4	
Dam No. 1 to head of Lake Joliet	3.	
Head of Lake Joliet to the mouth of Desplaines River	12.72	
	58.32	

A gauge record kept at Riverside for a period of 20 years from the year 1886 to 1904, both inclusive, showed the water stood at above 18 feet on the Riverside gauge an average of 4.3 days per year; at or above 13.8 feet an average of 47.6 days per year; at or above 13 feet an average of 73.2 days per year; at an elevation of 12.4 feet an average of 116.2 days per year; at or above 11.85 feet an average of 190.65 days per year.

When the water stood at 10.5 at the head of the 12 mile level at Summit, corresponding to 13 feet on the Riverside gauge, and a volume of 600 second feet, the water in the portage swamp and channels connecting with the Desplaines River would be flowing over to the Chicago River to the extent of the capacity of the trench that existed below this level. During the 20 year period referred to water would have flowed over the Chicago divide on an average of 73.2 days per year.

At all elevations when the water at Summit stood at 11.73 or above, corresponding to an elevation of 13.8 on the Riverside gauge, and to a volume of 1052 second feet, a boat drawing 15 inches of water could pass from the Desplaines River across the Mud Lake region and over the continental divide and into the Chicago River without making any portage between them. Such condition would have prevailed during the 20 year period an average of 47.6 days per year.

At an elevation between 13.8 feet and 13 feet the water would gradually diminish in depth on the Chicago divide, and when a portage became first necessary it would be about one mile in length, and when it reached the level of 10.5 it would be two miles in length between the west fork at Western Avenue, Chicago, and the beginning of deep water in Mud Lake.

At an elevation between 13 feet and 12.4 feet on the Riverside gauge boats could no longer pass between Mud Lake and the Desplaines River except light, and be entirely stopped, and a portage of one or two miles would be required between Mud Lake and the Desplaines River, in addition to the portage of two miles between the west fork and Mud Lake. In this condition there would be a substantial navigable depth of 15 inches between Isle la Cache and Mount Juliet, a distance of 11 miles. Isle la Cache is located in the Desplaines River on the township line between the towns of Du Page and Lockport.

At an elevation between 12.4 feet and 11.85 feet on the Riverside gauge the Chicago divide would require the two portages mentioned, or the alternative of a 7 mile portage between the waters of the Chicago River and the Desplaines. The Desplaines would have a navigable depth of 12 to 15 inches, with possibly some deficiency in one or two localities; from Romeo down to the head of Lake Joliet there would be sufficient water for a boat at the higher stages to go down partially loaded, and at the lower stages to go down light, but at the lower stages the cargo itself would require a transfer over the 11 miles from Isle la Cache to Mount Juliet. All the river below Lake Joliet would be navigated by discharging the cargo in part or wholly at Treat's Island, and near the mouth of the river.

There has been no time when the Desplaines River ran absolutely dry and there was not any water passing from pool to pool except as it was artificially produced by the abstraction of water from the Desplaines either for canal purposes during the time in which the Desplaines was used in that connection as a feeder, or through the cutting down of the Chicago divide and the draining of the water towards Chicago at medium and low stages.

Changes in Desplaines River. Various changes have been made in the Desplaines River from its condition as it existed in a state of nature. The portage swamp region lying east of the range line at Summit has been drained and made tributary to the Chicago River, except so much as is tributary to the canal, this area amounting to 48 square miles. There has been added from the Sag region an area of about 12 square miles, making the change below Lemont 36 square miles to be deducted from the former areas. The deficiency of rainfall averaging 2.9 inches per year during the period of 20 years from 1887 to 1910, computed from the Riverside gauge, would produce a deficiency in run-off of probably 15 or 20 per cent., and the effect of that would be to diminish both the volume and duration for the stages of water exhibited in the table referred to. There is also a deficiency in the run-off due to the substantial clearing away of the forest-covered area of 5 per cent. There are changes which have affected the distribution of the run-off. The clearing away of the forests has destroyed an element of control which has diminished the control and the duration of the stages of water; and in addition the restriction of ponds and lakes and the drainage of wet lands, bogs and marshes, and particularly the destruction of a special control existing in the portage swamp region and 12 mile level, all of which under natural conditions prolong the stages of water.

There have been radical changes in reference to the depletion of the water in the Desplaines River from a state of nature. The first change of significance was due to the construction of the Illinois and Michigan Canal in 1848. The effect of the construction of that canal upon the water in the lower Desplaines was a reduction of the drainage of the river below the dams at Joliet to less than 250 square miles out of a total of 1428 square miles. Further interference arose from the fact that the location of the canal along the south and east side of the valley caused the hill drainage to be turned in part toward Chicago, and on the tangent between Summit and Bridgeport (in the southwestern part of Chicago) it ran across the south arm of Mud Lake, cutting off the drainage and reservoir control of that portion of the portage swamp region lying to the south of the canal. From 1866 to 1871 the Illinois and Michigan Canal was deepened, causing interference with the flow of the river. Further interference was caused by the construction of ditches in the Mud Lake region, and by the erection of pumping works at Bridgeport in 1883. Interference also occurred by reason of the construction of the river diversion by the Sanitary District in 1893-4, by which the Desplaines River was shifted to the west and north side of the valley so as to leave a site between the river as thus changed and the Illinois and Michigan Canal for the construction of the drainage canal itself. Interference has also been caused by inhabitation which has cut away forests, thus

curtailing the run-off, and there has been drainage of swamps and wet lands, and the destruction of ponds and lakes. The Sanitary and Ship Canal, which was completed in 1892, joins the Desplaines at Dam No. 1, 31.6 miles from Riverside, from which point its waters flow into and increase the current of the Desplaines.

These various changes have materially interfered with the flow of the river, and the conditions in the basin itself have been changed by the actual disposition of the flow. The Desplaines River has an impermeable soil bottom, and the control that was exercised was surface control largely. The destruction of this surface control has affected the flow of the water much more radically than would have been the case had the ground been permeable.

Use of Desplaines River. From the latter part of the seventeenth century through the first third of the nineteenth century men engaged in the fur trade passed up and down the Chicago and Desplaines rivers in canoes and flat boats very regularly. Fourteen specific instances of the use of the Desplaines down to the year 1830 are shown in the evidence, as follows: Trips to Chicago: Joliet and Marquette, 1673; Perrault, 1783; Joutel, 1688; Hubbard, 1819; Ebenezer Child, 1821; Tonty, 1680; La Salle, 1681; Fonda, 1825. Trips from Chicago: Father Membre, 1682; St. Cosme, 1698; Hubbard, 1818; Marquette, 1674; Howard, 1790; Furman, 1830. Very many other trips made during the same period, not so well authenticated, are disclosed in the evidence, and numerous historical references to the Chicago-Illinois route. No doubt other instances of its use may properly be inferred. It was employed by the American Fur Company down to 1825, and then abandoned for other routes. The trial judge found as the record shows, that there is no evidence of actual navigation within the memory of living men, and therefore there would be no present interference with navigation by the building of the proposed dam. But it was held that the evidence shows the Desplaines a navigable water of the United States, preserved as such by the legislation of Congress.

In the early days the fur trade was a leading branch of commerce in the western world, and this trade was one of the characteristics of the Desplaines River. Large quantities of supplies of various kinds needed by the settlers in a new country were also transported over the Desplaines during the same period in boats of the size and character then commonly used in river commerce, this transportation being carried on between Chicago, St. Louis and other points. Canoes of several tons burden were used; some were 35 feet long by 6 feet wide, some 33 feet long by 4½ feet wide, worked by paddles and occasionally a sail, and had a crew of eight men, carrying as much as 6,000 pounds of freight as well as 1,000 pounds of provisions. The pirogues were manned by six or seven oars; the bateaux were larger than the pirogues; the Durham boats were heavy freight craft, 60 feet long, 8 feet wide, 2 feet deep, with a capacity of 15 tons, drawing 20 inches of water.

Commerce of this character existed until about the year 1825. After that year the fur trade having receded to interior portions of Illinois was reached more generally by horses. After the year 1848, when the Illinois and Michigan Canal was constructed, commerce

that had formerly been carried on the Desplaines River was carried on the canal. Radical changes had taken place in the condition of the river as heretofore shown, which resulted in a diminution of the flow in the river, and this was one of the causes for the non-use of the river.

Up to 1889 several dams had been built across the Desplaines River, to wit: Daggett's Mill, one half mile below Lockport; dam No. 1, 10 feet high, belonging to the state, Joliet; dam No. 2, 8 feet high, one-half mile below dam No. 1, also belonging to the state; Adams dam, 6 feet high, and less than a half mile below dam No. 2. Formerly a dam existed at the foot of Lake Joliet at Treat's Island, and also one at the foot of Lake Du Page. These have long been abandoned. There are at the present time no dams in the Desplaines between dam No. 1 and the mouth of the river. Some of these dams were constructed as early as the year 1835, and their existence in the river was a source of obstruction to the commerce that had formerly been carried on. There are also a considerable number of bridges of various kinds across the river.

Is the river navigable within the Act of 1899? The main question in the case is whether the evidence shows the Desplaines a navigable stream of the United States, or one capable of bearing interstate commerce via the Illinois and Mississippi, at the time of the passage of the acts of 1890 and 1899. If the river be decided navigable in fact, though not used for navigation, the further question is whether the words "navigable river, or other navigable water of the United States" includes a stream of navigable capacity, but not actually used in transportation for the past seventy-five years. In other words does the Act of 1899 refer only to streams then actually used for interstate commerce, or as well to rivers formerly navigated, like the Wisconsin, Rock, and hundreds of other streams of perfect navigable capacity, but whose use long ago ceased as an instrument of commerce (except for water powers)?

The Act of 1890 provides that dams or other structures in navigable waters of the United States shall not be built without authority of the Secretary of War; and the Act of 1899 that when such navigable waters are wholly within a state, such structures may be built under authority of the state legislature if the plans are submitted to and approved by the Chief of Engineers and the Secretary of War. Under this legislation it has been established that dams or other structures may be built only by joint assent of the national and state governments. The effect of the Act of 1899, "reasonably interpreted, is to make the erection of a structure in a navigable river, within the limits of a state, dependent upon the concurrent or joint assent of both the national government and the state government. The Secretary of War, acting under the authority conferred by Congress, may assent to the erection by private parties of such a structure. Without such assent the structure cannot be erected by them. But under existing legislation they must, before proceeding under such authority, obtain also the assent of the state acting by its constituted agencies." Cummings v. Chicago, 188 U. S. 410, 47 L. Ed. 525, approved in Going v. Ives, 222 U. S. 370, 56 L. Ed. 235, Simpson v. Shepard, 230 U. S. 352, 408, 57 L. Ed. 1511, 1543, Montgomery v.

Portland, 190 U. S. 89, 23 S. C. 735, 47 L. Ed. 765. See also Cobb v. Lincoln Park, 202 Ill. 427, 67 N. E. 5, 95 A. S. R. 258, 63 L. R. A. 264.

It is argued that the Act of 1899 was passed under the constitutional power to regulate interstate commerce, and as no such commerce on the Desplaines then existed the statute can have no application; and that if the statute be construed to reach beyond this it was to that extent beyond the legislative power. Even so it might be sustained under the war power. We have lately had a significant reminder of the inadequacy of railroad transportation in a time of stress.

But however this may be, we think streams of actual navigable capacity, but not now used for interstate commerce, are within congressional power to preserve for purposes of future transportation, and that the Act of 1899 applies to such streams. If this is not the proper construction very few interstate streams are within its terms. The Wisconsin River, that great water route of early times between the St. Lawrence and the Mississippi, could be destroyed if the state permitted. The Rock River in Wisconsin and Illinois, a stream in its natural state completely navigable from Lake Koshkonong to the Mississippi, would be under no government protection however important for future need. It might be covered with business blocks in cities lying upon it, as was permitted by the Wisconsin Supreme Court in State v. Carpenter, 68 Wis. 65, 60 Am. Rep. 848. Hundreds of like streams, immensely important to the future welfare of the country, on this theory could never come within the reach of congressional power, except possibly through restoration by the states. We are unwilling to assent to this narrow view of the purpose of the Act of 1899, and think it should be construed to refer to navigable capacity (which is the test of navigable water), and not rigidly restricted to streams floating interstate or foreign commerce at the time of its passage. The question has never been decided by the Supreme Court or other federal tribunal.

The disposition of this case upon these facts may therefore well be narrowed down to the question, Was the Desplaines River navigable in its natural condition?

The purpose of the provision referred to in the Ordinance of 1787 was not to declare or make the Desplaines River, or other waterways within the ceded territory, navigable waters of the United States, but only to define rights which depend on its existence. Illinois v. Economy Light & Power Co., 234 U. S. 497, 523, — Sup. Ct. —, — L. Ed. —. A further purpose was to retain forever the free and unrestricted use to the people of the country of any and all waterways then known to be navigable, or waterways that might thereafter be used by the people in the more remote parts of the country, for the purposes of commerce. In respect to waterways no additional power was granted by the ordinance to the newly created territory, either at the time of the cession or in 1818, when Illinois was admitted to the Union, over the power held by the original thirteen states, and the United States relinquished or lost none of its original power and control over the specific things included within its jurisdiction, one of the most important of which was the waterways.

The purpose of the Ordinance of 1787 is clearly stated by the court in The Montello, 20 Wall. 430, 444, — L. Ed. —, "to preserve the national character of all the rivers leading into the Mississippi and St. Lawrence, and to prevent a monopoly of their waters, was the purpose of the Ordinance of 1787, declaring them to be free to the public." It is immaterial to inquire whether the ordinance is still in force, or was superseded by the Illinois enabling act, or the act of admission, because the same principle is preserved in those statutes, and in the Illinois constitution. It is very evident that from the earliest days the intention of Congress has been to retain in the public for all time the right to the use of streams of navigable capacity. The Act of Congress of May 18, 1796, entitled "An Act providing for the sale of lands of the United States in the territory northwest of the River Ohio, and above the mouth of the Kentucky River," provides in section 9:

"And be it further enacted, that all navigable rivers within the territory to be disposed of by virtue of this Act, shall be deemed to be, and remain public highways."

The Act of Congress of March 26, 1804, entitled "An Act making provision for the disposal of public lands in the Indian Territory, and for other purposes," provides in section 6:

"That all navigable rivers, creeks and waters, within the Indian Territory, shall be deemed to be and remain public highways."

The contention of counsel for appellant that the carrying places between the streams cannot be held to be within the intent of Congress in preserving the right to the use of navigable streams, is not material in this case, for the reason that in the progress and improvement in the means and methods of transporting commerce those carrying places have become unnecessary. The fur trader of the early days had but one way to make his trip from Chicago to St. Louis; the waterways and the carrying places between. But the fact that changing methods have dispensed with the necessity for using the carrying places does not lessen in any degree the value of the navigable portions of the streams. It is also to be noted that the statutes of 1796 and 1804 referred to do not mention carrying places, but only refer to the waterways. If the carrying places were deemed of equal importance with the waterways they would undoubtedly have been mentioned in these acts.

In the leading case of The Montello, 87 U. S. 430, 22 L. Ed. 391, the court said at p. 441:

"And, independently of the Ordinance of 1787, declaring the 'navigable waters' leading into the Mississippi and St. Lawrence to be 'common highways,' the true test of the navigability of a stream does not depend on the mode by which commerce is, or may be, conducted, nor the difficulties attending navigation. If this were so, the public would be deprived of the use of many of the large rivers of the country over which rafts of lumber of great value are constantly taken to market.

It would be a narrow rule to hold that in this country, unless a river was capable of being navigated by steam or sail vessels, it could not be treated as a public highway. The capability of use by

the public for purposes of transportation and commerce affords the true criterion of the navigability of a river, rather than the extent and manner of that use. If it be capable in its natural state of being used for purposes of commerce, no matter in what mode the commerce may be conducted, it is navigable in fact, and becomes in law a public river or highway. Vessels of any kind that can float upon the water, whether propelled by animal power, by the wind, or by the agency of steam, are, or may become, the mode by which a vast commerce can be conducted, and it would be a mischievous rule that would exclude either in determining the navigability of a river. It is not, however, as Chief Justice Shaw said, (21 Pick. 344) 'every small creek in which a fishing skiff or gunning canoe can be made to float at high water which is deemed navigable, but, in order to give it the character of a navigable stream, it must be generally and commonly useful to some purpose of trade or agriculture.' * * * But the vital and essential point is whether the natural navigation of the river is such that it affords a channel for useful Commerce. If this be so the river is navigable in fact, although its navigation may be encompassed with difficulties by reason of natural barriers, such as rapids and sand bars."

In Miller v. Mayor of New York, 109 U. S. 385, 3 Sup. Ct. 228, 27 L. Ed. 971, the court said at p. 395:

"The power vested in Congress to regulate commerce with foreign nations and among the several states includes the control of the navigable waters of the United States so far as may be necessary to insure their free navigation; and by 'navigable waters' are meant such as are navigable in fact, and which by themselves or their connection with other waters form a continuous channel for commerce with foreign countries or among the states." Citing The Daniel Ball, 10 Wall. 557.

In The Daniel Ball, 10 Wall. 557, 19 L. Ed. 999, the court said at p. 563:

"Those rivers must be regarded as navigable rivers in law which are navigable in fact. And they are navigable in fact when they are used, or are susceptible of being used, in their ordinary condition, as highways for commerce, over which trade and travel are or may be conducted in the customary modes of trade and travel on water. And they constitute navigable waters of the states, when they form in their ordinary conditions by themselves, or by uniting with other waters, a continued highway over which commerce is or may be carried on with other states or foreign countries in the customary modes in which such commerce is conducted by water."

In St. Anthony Falls Water Power Co. v. Board of Commissioners, 168 U. S. 349, 18 Sup. Ct. 157, 42 L. Ed. 497, the Mississippi River at and above St. Anthony Falls, Minneapolis, was held navigable. The court say:

"In order to be navigable it is not necessary that it should be deep enough to admit the passage of boats on all portions of the stream."

Navigability does not depend on the amount of tonnage, depth of water, width of the stream, nor the use at some time for com-

merce. Navigability is determined by natural conditions. Gaston v. Mace, 33 W. Va. 14, 10 S. E. 60, 5 L. R. A. 392, 25 Am. St. 848. Neither character of craft nor relative ease or difficulty of navigation are tests of navigability. State v. Pacific Guano Co., 22 S. C. 50. "The test of navigability is navigable capacity without regard to the character of the craft, the business done, the ease of navigation, the surroundings of the stream." Heyward v. Farmers Mining Co., 42 S. C. 139, 19 S. E. 963, 28 L. R. A. 42, 46 Am. St. 742. In Stratton v. Currier, 81 Mo. 497, the court held as correct an instruction that the stream being of sufficient capacity to float logs, the public had a right to its use for that purpose. So in this case, the Desplaines River having the capacity to carry interstate and foreign commerce, the public has the right to its use. In Moore v. Sanborne, 11 Mich. 519, the court holds that navigability consists in the capacity for valuable floatage. This case also holds that the Ordinance of 1787 supersedes the common law doctrine of the necessity of usage or custom to establish a public right. In Burroughs v. Whitwam, 59 Mich. 279, the court held that the Ordinance of 1787 was intended to apply to such streams as were then common highways for canoes or batteaux in the commerce between the northwestern wilderness and the settled portions of the United States and foreign countries, and to such rivers not then in use as would by law be embraced in the definition of navigable waters. In Ten Eyck v. Town of Warwick, 27 N. Y. Supp. 536, 75 Hun 562, the court follows the reasoning in many of the cases cited, and says at page 539: "That is, streams must be capable, in their natural condition, of floating commodities to market," citing and quoting Morgan v. King, 35 N. Y. 461. In the latter case the court said:

"The true rule is that the public have a right of way in every stream which is capable, in its natural state and its ordinary volume of water, of transporting, in a condition fit for market, the products of the forests or mines, or of the tillage of the soil upon its banks. * * * Nor is it essential to the easement that the capacity of the stream, as above defined, should be continuous, or, in other words, that its ordinary state, at all seasons of the year, should be such as to make it navigable. It is ordinarily subject to periodical fluctuations in the volume and height of its water, attributable to natural causes, and recurring as regularly as the seasons, and if its periods of high water or navigable capacity ordinarily continue a sufficient length of time to make it useful as a highway, it is subject to the public easement."

In Wadsworth, Admr. v. Smith, 11 Me. 278, it is held:

"Those (streams) which are sufficiently large to bear boats or barges, or to be of public use in the transportation of property, are highways by water, over which the public have a common right."

In Brown v. Chadbourne, 31 Me. 11, the court at p. 22 said:

"A distinguishing criterion consists in the fitness to answer the wants of those, whose business require its use. Its perfect adaption to such use may not exist at all times, although the right to it may continue, and be exercised whenever an opportunity occurs. In

many rivers, where the tide ebbs and flows, the public are deprived of their use for navigation during the reflux of their waters. A way, over which one has a right to pass, may be periodically covered with water. In high northern latitudes, most fresh water rivers are frozen over during several months of the year."

The statement "A way, over which one has a right to pass may be periodically covered with water," gives rise to the suggestion that a river in the latitude of the Desplaines is ordinarily frozen over during some of the winter months; and in a new country where the roads, if any, are very poor and inadequate, such a river would afford an excellent highway, at least in many places, for teams drawing sleighs. In Lewis v. Coffey County, 77 Ala., 190, the court said at p. 193:

"We do not understand, that to constitute a navigable stream it is requisite there shall be sufficient water for the common uses of trade and commerce during all seasons of the year. It must, however, as the results of natural causes, be capable of valuable floatage periodically during the year, and so continue long enough at each period to make it susceptible of beneficial use to the public."

The same doctrine is announced in Morrison Bro. & Co. v. Coleman, 87 Ala. 655. In Little Rock, &c., R. R. v. Brooks, 43 Am. Rep. 277, (39 Ark. 463) the court after discussing the question of what constitutes navigable capacity, says:

"The true criterion is the dictate of sound business common sense, and depends on the usefulness of the stream to the population of its banks, as a means of carrying off the products of their fields and forests, or bringing to them articles of merchandise. If in its natural state, without artificial means, it may be prudently relied upon and used for that purpose at some seasons of the year, recurring with tolerable regularity, then, in the American sense, it is navigable, although the annual time may not be very long. Products may be ready and boats prepared, and it may thus become a very great convenience and materially promote the comfort, and advance the prosperity of the community."

Carter v. Thurston, 42 Am. Rep. 584 (58 N. H. 104).

In East Hoquiam Boom & Logging Co. v. Neeson et al., 54 Pac. Rep. 1001, 20 Wash. 142, the court holds it to be well settled that a stream which can only be made navigable or floatable by artificial means is not a public highway, citing a number of cases. In Kamm v. Normand, 91 Pac. Rep. 448 (50 Ore. 9) the court after an extensive review of the authorities, holds that a stream to be navigable or floatable for saw logs must be capable in its natural condition at ordinary recurring freshets of being successfully and profitably used for that purpose.

Under these authorities it seems clear that the Desplaines River having been used as an interstate highway of commerce from 1673 to 1825 in the only kind of commerce then existing, is to be deemed of navigable capacity and a navigable stream within the Ordinance of 1787 and the acts of Congress of May 18, 1796 and March 26, 1804, by which Congress specifically took jurisdiction over navigable

streams and declared that they should forever remain public highways. The river is a continuous stretch of water from Riverside to its mouth, and although there is a rapid, and in places shallow water, with boulders and obstructions, yet these things do not affect its navigable capacity. The same may be said of the upper part of the Illinois River above the head of steamboat navigation. We have no hesitation in deciding that both streams are navigable and are within the Act of 1899.

The only hesitation we have had in this case is on account of the decision of the Supreme Court of Illinois in Illinois v. Economy Light and Power Co., 241 Ill., 290, 89 N. E. 760. The difference in the records in the two cases would not perhaps warrant a different conclusion, although the evidence here is somewhat stronger in favor of navigability than in that case. Taking as we do a different view as to the force and effect of the historical accounts of the early use of the river, and being clear that it is in fact a navigable stream, we feel that we should follow our own views.

Decree affirmed.

A true Copy.

Teste: —— ——,

Clerk of the United States Circuit Court
of Appeals for the Seventh Circuit.

And afterwards, on the same day, to-wit: On the twenty-first day of January, 1919, in the October term last aforesaid, the following further proceedings were had and entered of record, to-wit:

TUESDAY, January 21, 1919.

Court met pursuant to adjournment and was opened by proclamation of crier.

Present:

Hon. Francis E. Baker, Circuit Judge, presiding.
Hon. Julian W. Mack, Circuit Judge.
Hon. Samuel Alschuler, Circuit Judge.
Hon. Evan A. Evans, Circuit Judge.
Edward M. Holloway, Clerk.
John J. Bradley, Marshal.

Before:

Hon. Francis E. Baker, Circuit Judge.
Hon. Evan A. Evans, Circuit Judge.
Hon. Arthur L. Sanborn, District Judge.

2525.

ECONOMY LIGHT AND POWER COMPANY

vs.

THE UNITED STATES OF AMERICA.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

This cause came on to be heard on the transcript of the record from the District Court of the United States for the Northern District of Illinois, Eastern Division, and was argued by counsel.

On consideration whereof, It is now here ordered, adjudged and decreed by this Court that the decree of the said District Court in this cause be, and the same is hereby affirmed.

And afterwards, to-wit: On the twentieth day of February, 1919, in the October term last aforesaid, there was filed in the office of the Clerk of this Court a certain Notice, which said Notice is in the words and figures following, to-wit:

In the United States Circuit Court of Appeals for the Seventh Circuit.

No. 2525.

ECONOMY LIGHT AND POWER COMPANY, a Corporation, Appellant,

vs.

UNITED STATES OF AMERICA, Appellee.

To Messrs. Charles F. Clyne and Clarence N. Goodwin, Solicitors for Appellee:

You are hereby notified that on the 20th day of February, 1919, at the hour of 11 o'clock A. M., or as soon thereafter as counsel can be heard, we shall appear before the United States Circuit Court of Appeals in chambers and pray an appeal from the judgment of that Court entered in the above entitled cause on the 21st day of January, 1919, to the Supreme Court of the United States, and shall present and file the following papers, copies of which are herewith served upon you:

1. Petition for appeal,
2. Order allowing appeal,
3. Assignment of errors,
4. Citation,

at which time and place you may appear if you so desire.

FRANK H. SCOTT,
Solicitor for Economy Light & Power Company, Appellant.

Received a copy of the above notice and of the papers therein mentioned this 19th day of February, 1919.

CLARENCE N. GOODWIN,
CHARLES F. CLYNE,
Solicitors for Appellee.

Endorsed: Filed Feb. 20, 1919. Edward M. Holloway, Clerk.

And afterwards, on the same day, to-wit: On the twentieth day of February, 1919, in the October term last aforesaid, there was filed in the office of the Clerk of this Court a certain Petition for Appeal, which said Petition for Appeal is in the words and figures following, to-wit:

In the United States Circuit Court of Appeals for the Seventh Circuit.

No. 2525.

ECONOMY LIGHT AND POWER COMPANY, a Corporation, Appellant,

vs.

UNITED STATES OF AMERICA, Appellee.

Petition for Appeal.

The above named appellant, Economy Light & Power Company, conceiving itself aggrieved by the judgment of the United States Court of Appeals for the Seventh Circuit, made and entered in the above entitled cause on the 21st day of January, 1919, and by the decree of the District Court of the United States for the Eastern Division of the Northern District of Illinois thereby affirmed, does hereby appeal from said judgment of said Circuit Court of Appeals to the Supreme Court of the United States, for the reasons specified in the assignment of errors filed herein, and prays that this appeal may be allowed and that a transcript of the record, papers and proceedings upon which said judgment was made, may be sent to the Clerk of the Supreme Court of the United States at Washington, D. C.

FRANK H. SCOTT,
Solicitor for Appellant,
Economy Light & Power Company.

Endorsed: Filed Feb. 20, 1919. Edward M. Holloway, Clerk.

And afterwards, on the same day, to-wit: On the twentieth day of February, 1919, in the October term last aforesaid, there was filed in the office of the Clerk of this Court a certain Assignment of Errors, which said Assignment of Errors is in the words and figures following, to-wit:

In the United States Circuit Court of Appeals for the Seventh Circuit.

No. 2525.

ECONOMY LIGHT AND POWER COMPANY, a Corporation, Appellant,

vs.

UNITED STATES OF AMERICA, Appellee.

Assignment of Errors.

The Economy Light & Power Company, appellant in the above entitled cause, says that in the record and proceedings therein and in the judgment of the Circuit Court of Appeals for the Seventh Circuit entered therein on the 21st day of January, 1919, manifest error has occurred to the prejudice of the said appellant and it assigns for error the following:

1. Said Circuit Court of Appeals for the Seventh Circuit erred in affirming the decree of the United States District Court for the Eastern Division of the Northern District of Illinois of May 25, 1917.

2. Said Circuit Court of Appeals erred in not reversing said decree of said United States District Court for the errors assigned upon the record in said cause.

3. Said Circuit Court of Appeals erred in holding that the Desplaines River was a navigable stream in its natural condition.

4. Said Circuit Court of Appeals erred in holding that the Desplaines River is now a navigable stream.

5. Said Circuit Court of Appeals erred in holding that the Desplaines River is a navigable water of the United States.

6. Said Circuit Court of Appeals erred in holding that from the latter part of the Seventeenth Century to the first part of the Nineteenth Century men engaged in the fur trade passed up and down the Desplaines River in canoes and flat boats regularly and that such passage constituted commerce.

7. Said Circuit Court of Appeals erred in holding that supplies of various kinds needed by the settlers were transported over the Desplaines River during the period preceding 1825 and that commerce existed upon said river until the year 1825.

8. Said Circuit Court of Appeals erred in not reversing the decree of said United States District Court, upon the ground that the Desplaines River was not navigable in its natural condition.

9. Said Circuit Court of Appeals erred in not reversing the decree of the said United States District Court upon the ground that the Desplaines River is not now navigable.

10. Said Circuit Court of Appeals erred in not reversing the decree of the said United States District Court upon the ground that the Desplaines River is not now navigable.

11. Said Circuit Court of Appeals erred in not reversing the decree of the said United States District Court upon the ground that the Desplaines River is not, in fact, capable of navigation for purposes of useful commerce, and that neither Section 8 of Article I of the Constitution of the United States, nor the Act of Congress of March

3, 1899, nor any other Act of Congress is applicable to said stream.

12. Said Circuit Court of Appeals erred in holding that the Act of March 3, 1899, applies to streams capable of navigation but upon which no commerce exists.

13. Said Circuit Court of Appeals erred in holding that the power of Congress to regulate Interstate Commerce does not depend upon the Commerce Clause of the United States Constitution, but may be sustained under the War Power.

14. The said Circuit Court of Appeals erred in holding that the Act of March 3, 1899, applies to streams not navigable at the time of the passage of said Act.

15. The said Circuit Court of Appeals erred in holding that the Act of March 3, 1899, applies to streams upon which no commerce existed at the time of the passage of said Act.

16. The Act of March 3, 1899, as construed and applied by said Circuit Court of Appeals to the Desplaines River would be unconstitutional.

17. Said Circuit Court of Appeals erred in holding that the ordinance of 1787 was preserved in the Constitution of Illinois.

18. Said Circuit Court of Appeals erred in holding that the ordinance of 1787 supersedes the common law doctrine of the necessity of use or custom to establish a public right of highway in streams.

19. Said Circuit Court of Appeals erred in holding that Section 9 of the Act of Congress of May 18, 1796, entitled, "An Act providing for the sale of lands of the United States in the territory Northwest of the River Ohio and above the mouth of the Kentucky River", and Section 6 of the Act of Congress of March 26, 1904, are applicable to the Desplaines River.

20. Said Circuit Court of Appeals erred in not holding that the Act of March 3, 1899, is not applicable to the Desplaines River.

21. Said Circuit Court of Appeals erred in not holding that the Commerce Clause of the United States Constitution does not give to Congress power to control by legislation streams upon which no commerce exists.

22. Said Circuit Court of Appeals erred in not holding that the Commerce Clause of the United States Constitution does not give to Congress power to control by legislation streams upon which no commerce existed at the date of the passage of such legislation.

23. Said Circuit Court of Appeals erred in not holding that the War Power does not give to Congress power to control by legislation streams upon which no commerce exists.

24. Said Circuit Court of Appeals erred in not holding that the War Power does not give to Congress power to control by legislation streams upon which no commerce existed at the date of the passage of such legislation.

25. Said Circuit Court of Appeals erred in not holding that under the Commerce Clause of the United States Constitution Congress only has power to legislate with reference to streams navigable by the standards of navigation existing at the date of such legislation.

26. Said Circuit Court of Appeals erred in not holding that the Act of March 3, 1899, applies only to streams which were navigable by standards of navigation existing at the date of the passage of said Act.

27. Said Circuit Court of Appeals erred in not reversing the decree of said United States District Court upon the ground that if the Act of March 3, 1899, or any other Act of Congress mentioned in appellee's bill of complaint or relied upon by appellee, applies to Desplaines River, said Acts are null and void under the provision of the 5th Amendment of the Constitution of the United States forbidding the taking of property without due process of law, and the taking of private property for public uses without just compensation.

28. Said Circuit Court of Appeals erred in not reversing the decree of said United States District Court upon the ground that if said Act of Congress of March 3, 1899, or any other of the Acts of Congress mentioned in appellee's bill of complaint or relied upon by appellee should be held to establish the character of said Desplaines River as navigable, then said Acts, and each of them, are and is, unconstitutional notwithstanding the ordinance of 1787, or any of the Acts of Congress for the government of the Northwest territory.

29. Said Circuit Court of Appeals erred in not reversing the decree of said United States District Court upon the ground that the United States is estopped from now claiming or contending that the Desplaines River is a navigable stream.

30. Said Circuit Court of Appeals erred in not applying the test of navigability laid down by the Courts of Illinois as to streams within said State.

31. Said Circuit Court of Appeals erred in not following the decision of the Supreme Court of Illinois in the case of People of the State of Illinois v. Economy Light & Power Company and reversing the decree of said District Court of the United States upon the ground that said judgment of the Supreme Court of Grundy County thereby affirmed was a judgment in rem establishing the character of the Desplaines River as a non-navigable stream in a state of nature.

32. Said Circuit Court of Appeals erred in not following the decision of the Supreme Court of Illinois in the case of People of the State of Illinois v. Economy Light & Power Company and reversing the decree of said United States District Court upon the ground that said judgment of the Supreme Court of the State of Illinois and the decree of the Circuit Court of Grundy County thereby affirmed was a judgment in rem establishing the character of the Desplaines River as a non-navigable stream notwithstanding the additional flow of water turned into the stream from the Sanitary District channel.

By reason of the foregoing errors, and others appearing upon the face of the record, appellant prays that the said judgment of the United States Circuit Court of Appeals for the Seventh Circuit and the decree of the said United States District Court for the Eastern Division of the Northern District of Illinois entered May 25, 1917, may be reversed and the cause remanded with instructions to said United States District Court to enter a decree in favor of appellant and dismissing the appellee's bill of complaint.

FRANK H. SCOTT,
Solicitor for said Appellant,
Economy Light & Power Company.

Endorsed: Filed Feb. 20, 1919. Edward M. Holloway, Clerk.

And afterwards, on the same day, to-wit: On the twentieth day of February, 1919, in the October Term last aforesaid, the following further proceedings were had and entered of record, to-wit:

THURSDAY, February 20, 1919.

Court met pursuant to adjournment and was opened by proclamation of crier.

Present:

Hon. Francis E. Baker, Circuit Judge, presiding.
Hon. Samuel Alschuler, Circuit Judge.
Hon. Evan A. Evans, Circuit Judge.
Edward M. Holloway, Clerk.
John J. Bradley, Marshal.

Before Hon. Francis E. Baker, Circuit Judge.

2525.

ECONOMY LIGHT & POWER COMPANY

vs.

UNITED STATES OF AMERICA.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

Upon motion of Frank H. Scott, solicitor for Economy Light & Power Company, appellant in the above entitled cause, due notice of said motion having been given the appellee, United States of America, by notice served upon Charles F. Clyne, United States District Attorney, and Clarence N. Goodwin, Special Counsel, its solicitors, it is ordered that an appeal to the Supreme Court of the United States from the judgment entered by this Court in the above entitled cause on, to-wit, the 21st day of January, 1919, be, and the same hereby is allowed upon the giving of a bond (such bond to be in the amount to be agreed upon by counsel for appellant and appellee and if not agreed upon to be hereafter fixed by this Court), within twenty (20) days to be approved by one of the Judges of this Court, conditioned according to law, and that a transcript of the record and proceedings herein, except the original book of maps, shall be transmitted to the Clerk of the Supreme Court of the United States, at Washington, D. C.

It is further ordered that the original book of maps shall be transmitted to the Clerk of the Supreme Court of the United States to be by him safely kept and returned to this Court upon the final determination of this cause in said Supreme Court.

It is further ordered that the mandate of this Court shall be stayed until the expiration of the time for filing of bond as herein

provided, and that upon the filing and approving of said bond the same shall operate as a bond for costs and damages on appeal and also as a supersedeas and a stay of further proceedings herein, pending the determination of said appeal in the Supreme Court of the United States.

And afterwards, to-wit: On the twelfth day of March, 1919, in the October term last aforesaid, the following further proceedings were had and entered of record, to-wit:

WEDNESDAY, March 12, 1919.

Court met pursuant to adjournment.

Present:

Hon. Francis E. Baker, Circuit Judge, presiding.
Hon. Samuel Alschuler, Circuit Judge.
Hon. Evan A. Evans, Circuit Judge.
Edward M. Holloway, Clerk.

Before Hon. Evan A. Evans, Circuit Judge.

2525.

ECONOMY LIGHT & POWER COMPANY

vs.

UNITED STATES OF AMERICA.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

Now comes the Economy Light and Power Company, appellant herein, and presents its appeal bond herein with National Surety Company as surety in the sum of Five Thousand Dollars ($5,000.00), which bond is hereby approved and ordered filed.

And afterwards, on the same day, to-wit: On the twelfth day of March, 1919, in the October term last aforesaid, there was filed in the office of the Clerk of this Court a certain Bond, which said Bond is contained in the order following herewith.

And afterwards, on the same day, to-wit: On the twelfth day of March, 1919, in the October term last aforesaid, the following further proceedings were had and entered of record, to-wit:

WEDNESDAY, March 12, 1919.

Court met pursuant to adjournment.

Present:

Hon. Francis E. Baker, Circuit Judge, presiding.
Hon. Samuel Alschuler, Circuit Judge.
Hon. Evan A. Evans, Circuit Judge.
Edward M. Holloway, Clerk.

Before Hon. Evan A. Evans, Circuit Judge.

2525.

ECONOMY LIGHT & POWER COMPANY

vs.

UNITED STATES OF AMERICA.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

Now this day comes the Economy Light and Power Company by its counsel and presents and files its bond, which said bond is in the words and figures following, to-wit:

Know all men by these presents, That Economy Light & Power Company, a corporation, as principal, and National Surety Company as surety, are held and firmly bound unto the United States of America in the full and just sum of Five Thousand Dollars ($5,000.00) to be paid to the said United States of America, to which payment well and truly to be made we bind ourselves and our successors, jointly and severally, firmly by these presents.

Sealed with our seals and dated this 28th day of February, in the year of our Lord one thousand nine hundred and nineteen.

Whereas, lately at a session of the United States Circuit Court of Appeals for the Seventh Circuit in an appeal pending in that Court from a decree of the United States District Court for the Eastern Division of the Northern District of Illinois, entered on the 25th day of May, 1917, in favor of the appellee, United States of America, and against the appellant, Economy Light & Power Company, the said decree of the said United States District Court was affirmed by said Circuit Court of Appeals and judgment entered in said Court on to-wit: the 21st day of January, 1919; and

Whereas, the appellant has obtained from said Circuit Court of Appeals an order allowing an appeal to the Supreme Court of the United States to review the judgment of said Circuit Court of Appeals and a Citation directed to the United States of America is about to

be issued citing and admonishing the said United States of America to be and appear at the Supreme Court of the United States to be holden at Washington in the District of Columbia.

Now, Therefore, the Condition of the above obligation is such that if the said appellant, Economy Light and Power Company, shall prosecute its said appeal with effect and shall answer all damages and costs that may be awarded against it if it fail to make its plea good, then the above obligation is to be void; otherwise to remain in full force.

ECONOMY LIGHT & POWER COMPANY,
By CHARLES A. MONROE,
Its President.
NATIONAL SURETY COMPANY,
By W. HERBERT STEWART,
Its Attorney in Fact.

Sp. Ass't to Att'y Gen.

2525.

ECONOMY LIGHT & POWER COMPANY

vs.

UNITED STATES OF AMERICA.

Appeal from the District Court of the United States for the Northern District of Illinois, Eastern Division.

Upon application of counsel for appellant, It is ordered that the time to docket cause and file the transcript of the record in the Supreme Court of the United States be, and the same is hereby extended sixty (60) days from March 22, 1919.

United States Circuit Court of Appeals for the Seventh Circuit.

I, Edward M. Holloway, Clerk of the United States Circuit Court of Appeals for the Seventh Circuit, do hereby certify that the foregoing typewritten and printed pages, numbered from 1 to 40, inclusive, contain a true copy of the proceedings had and papers filed (except the Order of October 27, 1917 relating to the filing, etc. of the printed record, the briefs of counsel and stipulations relating thereto) in the case of Economy Light and Power Company vs. United States of America, No. 2525, October Term, 1916, as the same remains upon the files and records of the United States Circuit Court of Appeals, for the Seventh Circuit.

In testimony whereof I hereunto subscribe my name and affix the seal of said United States Circuit Court of Appeals for the Seventh Circuit, at the City of Chicago, this fifth day of May, A. D. 1919.

[Seal United States Circuit Court of Appeals, Seventh Circuit.]

EDWARD M. HOLLOWAY,
Clerk of the United States Circuit Court of Appeals for the Seventh Circuit.

Citation.

The President of the United States to the United States of America, Charles F. Clyne, United States Attorney, and Clarence N. Goodwin, Special United States Attorney, Greeting:

You are hereby cited and admonished to be and appear at a Supreme Court of the United States to be holden at the City of Washington in the District of Columbia, within thirty (30) days from the date hereof, pursuant to an order allowing an appeal entered in the office of the Clerk of the United States Circuit Court of Appeals for the Seventh Circuit in a certain action therein pending, No. 2525, in which the Economy Light & Power Company is appellant and the United States of America is appellee, to show cause, if any there be, why the judgment rendered against the said appellant and in favor of the appellee as mentioned in the said order allowing the appeal, should not be corrected and why speedy justice should not be done to the parties in that behalf.

Witness the Honorable Francis E. Baker, one of the Judges of said United States Circuit Court of Appeals for the Seventh Circuit, this 20th day of February, A. D. 1919.

FRANCIS E. BAKER,
Circuit Judge.

Service of the within citation and receipt of the copy thereof is admitted this 10 day of March, A. D. 1919.

CLARENCE N. GOODWIN,
Sp. Ass't to the Att'y Gen.

STATE OF ILLINOIS,
County of Cook, ss:

Edgar Shroeder, being first duly sworn deposes and says that he served the above and foregoing citation upon Charles F. Clyne, United States Attorney, on the 11th day of March, A. D. 1919, by delivering a copy thereof to W. H. Small, chief clerk in the office of the said United States Attorney, at the office of said United States Attorney, in the City of Chicago, Illinois; that he served said citation upon the Attorney General of the United States and upon

the Solicitor General of the United States by mailing a copy thereof to each of them on the 10th day of March, 1919, by registered mail in envelopes properly stamped and addressed to said respective officers, at the City of Washington, D. C.

EDGAR SCHROEDER.

Subscribed and sworn to before me this 12th day of March, A. D. 1919.

ECONOMY LIGHT & POWER COMPANY,
Appellant,

vs.

UNITED STATES OF AMERICA,
Appellee.

APPEAL FROM THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT.

BRIEF AND ARGUMENT FOR APPELLANT.

FRANK H. SCOTT,
Attorney for Appellant.

GUNTHORP-WARREN PRINTING COMPANY, CHICAGO.

SUBJECT INDEX.

Introductory statement 1
The pleadings 4
The bill 4
The claim of title to the bed of the stream..... 4
The claim as set out in the bill of complaint that the Desplaines is a navigable water of the United States..... 6
Demurrer and answer 9
Statement of facts 15
Errors relied on 22
Points and authorities 26
Argument 38
As to title to the bed of the stream..... 38
What are navigable waters of the United States..... 40
The Act of March 3, 1899, is of general application. The test of navigability used by the Court of Appeals could apply only within a limited territory 41
The Court of Appeals erred in arriving at the conclusion that the Desplaines was a navigable stream because of the Ordinance of 1787 and the statutes for the governing of the territories.... 46
The Court of Appeals, failing to distinguish cases holding streams to be "floatable" from navigable waters of the United States, adopted an erroneous definition 55
Differences in the characteristics of the Fox River referred to in the Montello case 61
Right of Congress to legislate arises only under the Commerce Clause of the Constitution, and cannot be referred to its war powers 64
The Commerce Clause does not apply to a stream wholly within one state, which does not connect with waters making it available for interstate commerce..... 73
The national character of a stream terminates where it ceases to be a public highway for commerce between states..... 74
The upper Illinois is not navigable..... 74
The Sanitary District Canal is not a waterway of the United States 78
The circumstances of the submission of the plans of the proposed dam to the War Department..... 81
The Desplaines not a navigable stream..... 96
Errors of fact in the opinion of the Court of Appeals as to which there was no conflict in the evidence..... 129

Description of the Desplaines contained in opinion of the Court of Appeals erroneous..... 143
Errors of the Court of Appeals as to the Riverside gauge..... 151
Errors of the Court of Appeals as to changes in the river..... 155
The act of the Illinois Legislature for the construction of the Sanitary District Channel was framed to protect the water power rights of riparian owners along the Desplaines..... 157

INDEX OF CASES.

APPEAL FROM UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT.

MAY IT PLEASE THE COURT:

This is an appeal from a judgment of the Circuit Court of Appeals for the Seventh Circuit affirming a decree enjoining appellant from completing the construction of a dam upon its own property in, and a short distance above the mouth of, the DesPlaines River, at Dresden Heights, between Joliet and the Illinois River. Two grounds for injunction are alleged in the bill of complaint. The larger part of the bill is devoted to setting up a claim that the title to the bed is in the United States. The other ground is that the dam was being constructed in a navigable waterway of the United States, in violation of Section 9 of the River and Harbor Act of March 3, 1899, Ch. 425.

We shall state the pleadings and facts more fully hereinafter. At present, we inform this court:

1. That the claim of navigability of the DesPlaines River, as attempted to be made out by the appellee's evidence, is confined to a portion of it which is wholly within the State of Illinois.

2. That the Supreme Court of Illinois, in a proceeding brought by the state against this appellant to restrain the construction of this same dam, and upon substantially the same evidence as is here presented, has found the DesPlaines River not to be a navigable stream, and that appellant had the right to construct the dam. (241 Ill., 290.)

3. That the evidence showed, and the trial court and the Court of Appeals in their opinions found, that there was not at the time this action was begun, nor when the decree was entered, nor at any time within the memory of man, any commerce upon this river to be obstructed.

4. That the river is, and has been for years, obstructed by numerous substantial railroad and highway bridges; that dams have existed in the portion of it in question since the earliest settlement of the adjacent country and that it is obstructed by a large dam at Joliet owned by the State of Illinois.

5. That the lower courts in their opinions based their conclusion that the river is a navigable stream solely on the fact that there is some evidence that prior to the Ordinance of 1787 and to early legislation of Congress for the government of the Northwest territory, the river was used to some extent by explorers and fur traders, and they held that because the Ordinance and those early Acts of Congress enacted after the adoption of the Constitution, provided that all navigable waters leading to the Mississippi and St. Law-

rence Rivers should be common highways and forever free without impost or duty, therefore, and for that reason alone, the DesPlaines is to be regarded as a navigable stream within the Act of Congress under which the suit was brought and within the Commerce clause of the Constitution.

6. That before the enterprise of building the dam was entered upon, and years before this suit was begun, the plans were in fact submitted to the Chief of Engineers and the Secretary of War, who ruled that the DesPlaines River was not a navigable waterway of the United States, and that the projectors of the enterprise were assured in writing that there was no objection on the part of the Government to the building of the dam, which, as the engineers stated, would be a benefit to the United States if it should ever undertake to make the DesPlaines navigable.

THE PLEADINGS.

I.

THE BILL.

The bill was filed December 14, 1909 (pp. 3188-3201).

As said above, relief was prayed for on two grounds: (1) that the portion of the river bed on which the dam was being constructed was the property of the United States; (2) that the DesPlaines River was a navigable waterway of the United States and that appellant was constructing the dam without having obtained the consent of Congress and without the authority of the Legislature of Illinois, thereto, and without having had the plans thereof approved by the Chief of Engineers and by the Secretary of War, as required by the Act of Congress of March 3, 1899, Ch. 425, hereinafter quoted (pp. 7-8).

Claim of Title to the Bed of the Stream.

The bill recited that by Act of Congress of March 2, 1827, there was granted to the State of Illinois land for the purpose of aiding in opening a canal between the Illinois River and Lake Michigan; that prior thereto the United States had made a survey of public lands adjacent to the DesPlaines River, including the portion thereof in which the dam in question was being constructed, and had caused the river to be meandered, which surveys became part of the public records of the United States; that the construction of the Illinois and Michigan Canal was begun in 1837, and completed in 1848; that by an act of February 26, 1839, the State of Illinois provided for the sale and disposal of the lands so granted, and among other things that

> "lands situated upon streams which have been meandered by the surveys of public lands by the United States shall be considered as bounded by the lines of those surveys, and not by the stream";

It alleged that by this Act the Legislature declared it to be its understanding that the grant of March 2, 1827, did not include the land and the river bed within said meander lines, and that therefore the State of Illinois did not accept from the United States any grant thereof. The bill further recites that in 1843 the State for the purpose of raising a fund to complete the canal, conveyed the canal itself and all the remaining lands and lots belonging to the canal fund, to a board created by the Legislature, and known as the Board of Trustees of the Illinois and Michigan Canal; that the board caused a survey of such lands to be made, upon which the meander lines of the DesPlaines River as shown by the Government Survey were designated as the boundaries of the lands granted by the United States and accepted by the State of Illinois under the Act of March 2, 1827; that by deed dated October 22, 1860, the board of trustees conveyed to one Boyer, certain lands by description, and that the portion of the DesPlaines River in which the dam had been commenced by appellant, flows through the lands described in the deed to Boyer; that appellant claims title to this land through mesne conveyances from Boyer. But the bill alleges that because of the provision above quoted from the Act of the Legislature of Illinois of March 2, 1827, no title to the bed of the stream passed to Boyer, and that that portion of the river bed is the property, and subject to the control, of the United States.

The District Court in its opinion found that this theory of ownership in the United States as a ground for injunction, was untenable (p. 3238), and though the claim was asserted in the argument in the Court of Appeals, no reference was made to it in the opinion of that court.

THE CLAIM, AS SET OUT IN THE BILL OF COMPLAINT, THAT THE DESPLAINES RIVER IS A NAVIGABLE WATER OF THE UNITED STATES.

To sustain the second claim the bill alleged that the portion of the DesPlaines River in question was covered by the following Acts and Ordinance, and became by virtue thereof, and is, navigable water of the United States:

1. An Act of the Illinois Legislature of February 28, 1839, declaring the DesPlaines River from a point where it most nearly connects itself with the Illinois and Michigan Canal *to its sources within the boundaries of Illinois*, to be navigable.

(The point here referred to is above the portion of the river claimed in this suit to be navigable, and no attempt was made to prove that the portion referred to in the Act was ever in fact navigable.)

2. The Ordinance of 1787 for the government of the Territories, providing that the navigable waters leading to the Mississippi and St. Lawrence Rivers *and the carrying places between* the same, should be common highways, and forever free, without tax, impost or duty.

3. The Statute of the United States of 1846, Ch. 89, Sec. 3, admitting Wisconsin into the Union as a State, which enacted that the Mississippi and other rivers bordering on the states, shall be common highways, etc.

It further alleged that the portion of the river in which appellant had commenced construction of the dam, was in its natural condition navigable in fact; that upon completion of the Illinois and Michigan Canal the portion of the river below the point of its connection with the canal, by reason of its connection with the canal and the Illinois River, formed part of a continuous highway

for commerce embracing Lake Michigan, the Chicago River, the Illinois and Michigan Canal, the DesPlaines and Illinois Rivers, and the Mississippi River, and regardless of obstructions and shallow places, was part of the navigable waterways of the United States.

(As a matter of fact the Illinois and Michigan Canal leaves the river at a point some fifteen miles north of the site of the dam, and has no connection with the DesPlaines or Illinois from that point, until it reaches its terminus at La Salle.)

The bill further alleged that under an Act of the Legislature of Illinois of May 29, 1889, the Sanitary District of Chicago had constructed a canal connecting the Chicago and DesPlaines Rivers, at a point above the portion of the river in which the dam was being constructed, which Sanitary District Canal, since its opening in 1900, has been and is part of the navigable waters of the United States, and that thereby the quantity of water flowing through the DesPlaines River has been largely increased, and that the portion in question is now water navigable in fact; that with the exception of rapids at certain places in the river between Joliet and the Illinois River, the river

> "has been, since the opening of said sanitary district canal, and now is, capable of being navigated for the purposes of commerce, and that difficulties arising on account of said rapids above mentioned, are capable of being overcome through the improvement of said river by locks, canals and dams."

The bill set out the portion of the Act of March 3, 1899, Ch. 425, on which complainant relied, which is as follows:

> "That it shall not be lawful to construct or commence the construction of any bridge, dam, dike or causeway over or in any port, roadstead, haven, harbor, canal, navigable river, or other navigable water

> of the United States until the consent of Congress to the building of such structures shall have been obtained and until the plans for the same shall have been submitted to and approved by the Chief of Engineers and by the Secretary of War; provided, that such structures may be built under authority of the legislature of a state across rivers and other waterways the navigable portions of which lie wholly within the limits of a single state, provided the location and plans thereof are submitted to and approved by the Chief of Engineers and by the Secretary of War before construction is commenced."

The bill alleged that appellant had never obtained the consent of Congress to the building of the dam, nor had the plans been approved by the Chief of Engineers and by the Secretary of War; that the structure so far as completed, was in violation of the Act of March 3, 1899, and that if completed it would be a permanent obstruction of the river. The prayer of the bill has been stated above.

The bill did not allege that there was any commerce on the river to be obstructed. The only suggestion that there ever had been any is in the allegation that

> "upon the completion of the Illinois and Michigan Canal said portion of said DesPlaines River, below the point of its connection with said canal and the Illinois River, formed a part of a continuous highway for interstate and foreign commerce embracing Lake Michigan, the Chicago River, the Illinois and Michigan Canal, the DesPlaines and Illinois Rivers and the Mississippi River."

There was not a particle of evidence tending to sustain this allegation, and the fact is as found by the trial judge in his opinion, that there is "No evidence of actual navigation within the memory of living man" (p. 3237), and the Court of Appeals, in its opinion, said that this was shown by the record.

The Demurrer and Answer.

Defendant demurred and answered the bill. (Answer, pp. 3203-3233.) Among other grounds of demurrer specified were the following: (6) That the bill alleged that the DesPlaines River became navigable water of the United States by virtue of the Ordinance of 1787; (7) that the bill alleged that by virtue of the Act of the Legislature of Illinois of February 28, 1839, the portion of the DesPlaines River referred to in that act became navigable water of the United States; (8) that the bill alleged that by the Act of Congress admitting Wisconsin into the Union, the portion of the river in Wisconsin became navigable water of the United States; (9) that the bill did not allege that the dam would interfere with commercial navigation upon said river; (10) that the bill did not allege that there was any commercial navigation upon the river which would be interfered with or obstructed by the completion or maintenance of the dam; (11) that the bill showed that defendant was in possession of the land and river within the meander line referred to, under *bona fide* claim of title, and that its object was to divest defendant of its title thereto, and that defendant, by virtue of the Seventh Amendment to the Constitution of the United States, and Section 5 of Article 11, of the Constitution of Illinois, had a right to have its title determined in a court of law by a jury.

The demurrers were overruled in the final decree.

Answering, the defendant admitted that it had commenced the construction of the dam without the consent of Congress or the authority of the Legislature of Illinois, or the approval of the plans by the Chief of Engineers or the Secretary of War (except as later stated in the answer). It averred that by the legislation set out in the bill concerning the Illinois and Michigan Canal,

and the selection of lands thereunder by the canal commissioners, each alternate section along the route of the canal, including the land and river bed within the meander lines of the DesPlaines River in Section 25—the site of the dam—became vested in the State of Illinois, with full power in the State to sell and convey the same. It admitted that the United States, during the year 1821, caused a survey to be made of public lands along the DesPlaines River, including the portion where the dam was under construction, but denied that it caused the river to be meandered, or that surveys showing the meander lines became a part of the public records of the United States relating to public lands.

The answer denied that by the Act of the Illinois Legislature of February 26, 1839, it was provided that

> "that lands situated upon streams which have been meandered by the surveys of public lands by the United States shall be considered as bounded by the lines of those surveys, and not by the stream,"

but averred that the Act provided that certain conditions, of which one was expressed in the language quoted, should be annexed to, and compose a part of, the contract in all sales of land and lots thereunder, but it denied that the State did not accept from the United States the land and river bed within the meander lines, and averred that at all times the State had insisted that the title thereto passed to the State from the United States. The answer further alleged that if in fact the DesPlaines is a navigable river, then the title to its bed passed from the United States to the State upon its admission into the Union in 1818.

The answer admitted that defendant's title was derived as stated in the bill, but denied that it had no title to the bed of the stream or the land within the meander lines. It admitted that the Illinois and Michigan Canal since

its completion in 1848, had been an artificial navigable waterway connecting the Chicago and Illinois River, that it connects with the DesPlaines River near Joliet, and follows the bed of that stream for a distance of between one and two miles, diverging from it about fifteen miles above the point where the dam was being constructed, and from the point of divergence paralleling the DesPlaines and Illinois Rivers to La Salle, where it connects with the Illinois River.

It averred that the dam was not in that part of the DesPlaines referred to in the Illinois Act of February 28, 1839, and that it is not competent for the State to create a navigable stream by a statutory declaration of navigability. It alleged that the Ordinance of 1787 ceased to have any effect upon the admission of Illinois into the Union. It denied that the provisions of the statute of the United States of 1846, admitting Wisconsin into the Union, applied to the DesPlaines River, or that that statute, or the Ordinance of 1787, had the effect of making the DesPlaines, or any portion of it, navigable waters of the United States. It denied that that river was in its natural condition, or after the completion of the Illinois and Michigan Canal, or the Sanitary District Canal, actually used or capable of being used for purposes of navigation, or for purposes of useful commerce, and averred that it could only be made navigable by entirely changing the character of the river, and making a navigable stream where none had before existed. It was further averred that for over a hundred years the United States had treated the DesPlaines as a nonnavigable stream; that it had several times had it surveyed for the purpose of ascertaining the possibilities of creating a navigable channel therein, but that the reports of its engineers making such surveys had shown that it was not a navigable stream, and that it had without protest, per-

mitted dams and bridges to be constructed over it from the earliest days down to the present time, without its consent, and had never attempted to exercise any jurisdiction over any part of it.

Certain facts as to the history of the proposed enterprise, and the full correspondence between its projectors and the War Department prior to entering upon it, showing that it met with the full approval of that Department, and the opinion of Secretary of War Taft that no permit was necessary to put any obstruction in the DesPlaines River, because it was not a navigable stream, are set out in full in the answer. (pp. 3213-3228.) Details of these matters will not be referred to here, as it will be necessary to go into them at some length, in the argument. It is sufficient to say here that the answer alleged that it was in reliance upon this attitude, and these acts, of the United States, that defendant began the construction of the dam, and in connection therewith, expended large sums of money, and incurred liabilities for other large sums, and it averred that in view of these facts the present action of the United States as to the navigability of the stream was unjust and inequitable.

The answer set up and relied on a decree in favor of this appellant of the Circuit Court of Grundy County, Illinois, in an action brought by the State of Illinois, to restrain the erection of the same dam, which decree was affirmed by the Supreme Court of Illinois October 26, 1909, the latter court holding that the title to the bed of the stream was in this appellant, and that the stream itself was not navigable; the answer alleged that the decree of the State court constituted a judgment *in rem* as to both points.

The answer admitted that the Sanitary District Canal was navigable, but denied that it was navigable water of

he United States, or subject to the jurisdiction and ontrol of the Federal Government. It averred that the ct of the Illinois Legislature under which it was con-tructed provided that whenever the Federal Govern-nent, after the water should have been turned into the anitary District Canal should improve the DesPlaines nd Illinois Rivers for navigation to connect with the anitary District Canal, it should have full control over hat Canal for navigation purposes, but not to interfere vith its control for sanitary or drainage purposes; but t averred that the general Government had not im-roved those rivers for navigation or otherwise, and had o control over the Sanitary District Canal.

The answer denied that Section 9 of the Rivers and Harbor Appropriation Act of March 3, 1899, Ch. 425, as any application to the DesPlaines River; it alleges hat the purpose of the act was to protect commerce, and hat there was no commerce on the DesPlaines to be pro-ected, and that it was not a navigable water of the United States.

Leave was given to appellant to amend its answer to conform to the evidence and the arguments made in the cause.

The amendment to the answer appears at pp. 3235-3236. It averred that the DesPlaines River was not in fact, capable of navigation for purposes of useful commerce, and that neither Section 8, Article 1 of the Constitution of the United States, nor the Act of Congress of March 3, 1899, nor any other Act of Congress is applicable to such a stream; that there was not, and had not been within the memory of mankind, any commerce upon the Des-Plaines River, and that Congress had no power to control or regulate the use of the river; that if the Act of March

3, 1899, or any of the acts mentioned in the bill, or relied on by complainant, should be held to establish the character of the DesPlaines River as navigable, then said acts are unconstitutional, notwithstanding the Ordinance of 1787, or any of the Acts of Congress for the government of the Northwest territory.

STATEMENT OF FACTS.

It will be necessary, in the argument, to refer in detail to historical facts concerning the DesPlaines River, and also to the circumstances connected with the projected enterprise. Therefore, to avoid repetition, a very brief statement of facts will be made at this point.

The acquiring of the necessary lands to develop the water power near the mouth of the DesPlaines River, was begun by Frank G. Logan and Charles A. Munroe in the spring of 1904. (Tr., 3182.) Appellant, the Economy Light & Power Company, had no interest in that enterprise until all the properties necessary for the construction of the dam, and to be affected by the flowage resulting therefrom, had been acquired. The lands thus acquired, aggregated some 1,700 acres. Thereafter the owners made all necessary financial arrangements for constructing the dam and works. But in April, 1906, negotiations were entered upon with appellant which resulted in the sale of all the properties to the latter in November of that year.

Appellant, at the time of the purchase, executed a mortgage securing $3,000,000 of bonds, the security being the properties in question and other properties owned by appellant. Two million dollars of these bonds were sold for the purpose of raising money to pay for the proposed dam and power house. Contracts were entered into by appellant for the construction work and for the purchase of necessary machinery, and several hundred thousand dollars were spent, and contracts involving other large amounts were entered into before the work was interrupted at the suit of the State of Illinois. (Tr., 2198-2199, 3184-3185.)

Both the State of Illinois and the United States have always treated the DesPlaines River as an unnavigable stream, which the riparian owners had the right to bridge and dam as they saw fit.

As early as 1826 a dam was built practically at the site of that proposed to be built by appellant. Private dams existed on the river until taken and paid for by the State in the construction of the Illinois and Michigan Canal and of the Sanitary Channel. At the time of the trial there were thirteen bridges between Joliet and the mouth of the river being the portion of the river in which appellant was erecting its dam, and fifty bridges between Lockport and Irving Park. (pp. 1037-39.) Surveys had been made by the United States as to the feasibility of making improvements in the river in case it should ever be deemed desirable to do so. In 1905 the Ernst Board of Engineers had made a report upon a survey for a fourteen-foot waterway from Lockport to the mouth of the Illinois River. In order that he might know whether the project of building the dam would, in the language of the Chief of Engineers, General MacKenzie, "be in harmony with the work of improvement proposed by the Government," Munroe, before the sale to appellant, laid the plans before the War Department, and it assured him that they would harmonize with the tentative plans for such improvement. And not only that; the Government engineers declared that the dam would save the Government a large sum in case it ever undertook the improvement of the river for navigation. The War Department, however, and the Secretary of War, pronounced the stream to be unnavigable. The circumstances of the submission of these plans appear in more detail hereafter at page 81.

While the work was in progress, and on December 30,

1907, the State of Illinois brought an action against the present appellant in the Circuit Court of Grundy County to prevent the construction of the dam. The proceeding was by information. Among other things, it was claimed that the DesPlaines was a navigable waterway of the United States, and that the dam was being built contrary to the provisions of the Act of March 3, 1899. An injunction was issued restraining the further prosecution of the work. The case was tried before the Honorable Julian W. Mack, judge of the Circuit Court of Cook County, and decided in favor of the Economy Light & Power Company, the court finding that the DesPlaines was not a navigable stream. The State took an appeal to the Supreme Court of Illinois, which affirmed the decree on October 26, 1909, in a very extended opinion reported in the 241 Ill., 290. A writ of error was taken by the State to the Supreme Court of the United States, which was dismissed for want of jurisdiction in an extended opinion June 2, 1914. (*State* v. *Economy Light & Power Company,* 234 U. S., 497.) In the meantime, and after the decision of the State Supreme Court, the present action was brought by the Attorney General of the United States. The argument was concluded in the trial court February 22, 1913, the case taken under advisement by Judge Landis, and decree was rendered in favor of the United States on the 25th of May, 1917. This decree was affirmed by the Court of Appeals January 21, 1919, from which order this appeal is taken.

The bulk of the material evidence in the trial of the instant case was that given in the State case and read into this record by stipulation. All the evidence shows that the DesPlaines River, either in its natural condition, or as augmented by artificial works, has never been used or been capable of be-

ing used, for purposes of navigation. The records of early explorers and adventurers, the testimony of early settlers, the fact that all their supplies were brought in and all their produce carried out in wagons, the reports of engineers to select the line of the canal, the act of the State in building the canal paralleling the river, the reports of United States engineers making surveys for a deep waterway, and the opinion of experts,—all conclusively establish this fact.

The trial court and the Court of Appeals found that there never had been any navigation on the river within the memory of living man but rested their decisions upon a definition of navigable waters of the United States, which is not sanctioned by any authority, and which, if adopted, would include streams over which the Government under the Commerce clause of the Constitution, can have no jurisdiction.

DESCRIPTION OF THE RIVER FROM LOCKPORT TO ITS MOUTH, AND OBSTRUCTIONS IN IT.

What purports to be a description of the river, contained in the opinion of the Court of Appeals is largely not a description of the river as it exists. We shall show in the argument to follow that what the court describes is an attempted reproduction of the river as it was supposed by a witness, Cooley, to have existed in a state of nature. Cooley asserted that an engineer could reproduce the DesPlaines just as Cuvier could reproduce an extinct mammal, or Agassiz a fish from bones that are left. We shall show that the most important "bones" were missing, and that Cooley began his attempted reproduction by assuming without data, that they were of a certain character. All that is said in the opinion of the Court of Appeals, as to possi-

bilities of boats passing up and down the river and across the Chicago Divide refers to this assumed "state of nature," which it is admitted, and indeed strenuously insisted, has not existed for upward of seventy years.

We shall further point out in the argument, that the reference by the Court of Appeals to the Riverside gauge readings is very misleading since the elevations in the gauge refer to the levels above Chicago datum, and not to depths, the reading of 11 feet 4 inches representing no water in the river except in pools.

The distance from Lockport to the mouth of the river is 20 miles. The fall of the river from Lockport to Joliet is about 38 feet in 4½ miles. From Dam No. 1 in Joliet to the head of what is known as Lake Joliet, there is a fall of 21 feet in 3½ miles. Lake Joliet is a pool about 5 miles in length with but little fall. Below the foot of Lake Joliet the river divides and forms what is called Treat's Island. The main channel is on the left of that island and there is a fall in it of 9½ feet in 1-1/10th miles, and that fall is concentrated at the head and foot of the island.

After passing Treat's Island the river is again united and forms a pool about one mile long, in which there is very little fall. In the next stretch there is a fall of about 2-7/10th feet in one mile. Then follows a pool described in the opinion of the Court of Appeals, inadvertently as 13 miles long but which is in fact 3 miles long, where there is a fall of two feet in 3 miles; and in the last half mile above the mouth of the river, there is a fall of 3½ feet. It is across the lower end of this stretch that the proposed dam is to be located. The bottom of the river from Lockport to the dam in question, with the exception of that portion along Lake Joliet,

is covered with a large number of bowlders of various sizes, some of them between two and three feet in diameter. (pp. 2210, 2637, 2639, 2640, 2643, 2655.) The Supreme Court of Illinois, in *People* v. *Economy Light & Power Co.*, 241 Ill., 290, upon practically the same evidence, said:

> "The evidence shows that these bowlders are of various sizes, some of them between two and three feet in diameter. Some of them are covered entirely with water, while others project slightly above the surface of the water. It is also shown that in going down the river in a skiff or any kind of boat there is great danger of coming in contact with these bowlders. The current is so strong that it is not possible to row a boat upstream over these rapids. In addition to the natural barriers already spoken of, the evidence shows that the stream is tortuous and the channel very narrow at places. The slopes in the river already given do not represent the greatest fall that can be found in this stretch. The evidence shows that there is near the head of Treat's Island a fall of seventeen feet to the mile, and near the foot the slope is eighteen feet to the mile, and in the right-hand channel opposite Treat's Island there is a space of five hundred feet in which the fall is fifty feet to the mile, and if shorter distances are taken even greater slopes than these will be found to exist. At one place near the mouth of the river there is a fall for three or four hundred feet of twenty feet to the mile. Between the mouth of the river and Lockport there are thirteen bridges across the river, none of which have draws to permit the passage of boats, if such passage were otherwise possible. Two of these bridges are railroad bridges, and all of them are permanent steel structures. Above Lockport there are some forty other bridges across the stream, constructed for steam or electric railroads and for wagons. The width of the river varies greatly. At some places it is not more than sixty feet wide, while in the widest place in Lake Joliet it is over one thousand feet wide. The evidence shows that the depth of water in the

river varies considerably in different places and also at different times in the same places. A chart showing the gauge readings at Riverside, a point twenty-eight miles above Joliet, shows the number of days in each year during which the river was dry at this point, which indicates that there were from twenty-four days in 1890 to two hundred and thirteen days in 1895 during which the river was dry at this point. This chart also shows the number of days during each of these years when there was a discharge of less than six inches of water at Riverside, the result of which is, totaling the number of dry days and the days showing less than a six-inch discharge, that there were from one hundred and twenty days in 1888 to three hundred days in 1901 when the river was either dry or showed less than six inches of water at Riverside. The depth of the river during the balance of the year is not shown on this chart. These gauge readings also show that the dry or low periods did not occur during the same time in each year. Every month in the year is represented several times during the years covered by this chart, from which the conclusion is drawn that there were no regular periods when a given stage of water could be safely expected.

We refer to the readings on the Riverside gauge, not because of their bearing on the question of navigability at that point, but for the reason that they tend to show the natural volume of water in the channel above the points where the volume is increased by the additions made by the Illinois and Michigan Canal and the drainage channel, which added from 250,000 to 400,000 cubic feet of water per minute to the river below the point of connection."

In addition to the obstructions mentioned in the above quotation from the *Economy* case in the Supreme Court of Illinois, there is a solid masonry bridge at Dam No. 1 at Joliet owned by the State, in connection with which there is a very extensive power house. This dam extends entirely across the stream.

ERRORS RELIED ON.

1. Said Circuit Court of Appeals for the Seventh Circuit erred in affirming the decree of the United States District Court for the Eastern Division of the Northern District of Illinois of May 25, 1917.

3. Said Circuit Court of Appeals erred in holding that the DesPlaines River was a navigable stream in its natural condition.

5. Said Circuit Court of Appeals erred in holding that the DesPlaines River is a navigable water of the United States.

6. Said Circuit Court of Appeals erred in holding that from the latter part of the Seventeenth Century to the first part of the Nineteenth Century men engaged in the fur trade passed up and down the DesPlaines River in canoes and flat boats regularly and that such passage constituted commerce.

7. Said Circuit Court of Appeals erred in holding that supplies of various kinds needed by the settlers were transported over the DesPlaines River during the period preceding 1825 and that commerce existed upon said river until the year 1825.

8. Said Circuit Court of Appeals erred in not reversing the decree of said United States District Court, upon the ground that the DesPlaines River was not navigable in its natural condition.

10. Said Circuit Court of Appeals erred in not reversing the decree of the said United States District Court upon the ground that the DesPlaines River is not now navigable.

11. Said Circuit Court of Appeals erred in not reversing the decree of the said United States District

Court upon the ground that the DesPlaines River is not, in fact, capable of navigation for purposes of useful commerce, and that neither Section 8 of Article I of the Constitution of the United States, nor the act of Congress of March 3, 1899, nor any other act of Congress is applicable to said stream.

13. Said Circuit Court of Appeals erred in holding that the power of Congress to regulate Interstate Commerce does not depend upon the commerce clause of the United States Constitution, but may be sustained under the war power.

14. The said Circuit Court of Appeals erred in holding that the Act of March 3, 1899, applies to streams not navigable at the time of the passage of said act.

15. The said Circuit Court of Appeals erred in holding that the Act of March 3, 1899, applies to streams upon which no commerce existed at the time of the passage of said act.

16. The Act of March 3, 1899, as construed and applied by said Circuit Court of Appeals to the DesPlaines River would be unconstitutional.

17. Said Circuit Court of Appeals erred in holding that the ordinance of 1787 was preserved in the Constitution of Illinois.

18. Said Circuit Court of Appeals erred in holding that the ordinance of 1787 supersedes the common law doctrine of the necessity of use or custom to establish a public right of highway in streams.

19. Said Circuit Court of Appeals erred in holding that Section 9 of the act of Congress of May 18, 1796, entitled, "An act providing for the sale of lands of the United States in the territory northwest of the River Ohio and above the mouth of the Kentucky River," and

Section 6 of the act of Congress of March 26, 1904, are applicable to the DesPlaines River.

21. Said Circuit Court of Appeals erred in not holding that the commerce clause of the United States Constitution does not give to Congress power to control by legislation streams upon which no commerce exists.

22. Said Circuit Court of Appeals erred in not holding that the commerce clause of the United States Constitution does not give to Congress power to control by legislation streams upon which no commerce existed at the date of the passage of such legislation.

25. Said Circuit Court of Appeals erred in not holding that under the commerce clause of the United States Constitution Congress only has power to legislate with reference to streams navigable by the standards of navigation existing at the date of such legislation.

26. Said Circuit Court of Appeals erred in not holding that the Act of March 3, 1899, applies only to streams which were navigable by standards of navigation existing at the date of the passage of said act.

27. Said Circuit Court of Appeals erred in not reversing the decree of said United States District Court upon the ground that if the Act of March 3, 1899, or any other act of Congress mentioned in appellee's bill of complaint or relied upon by appellee, applies to DesPlaines River, said acts are null and void under the provision of the 5th Amendment of the Constitution of the United States forbidding the taking of property without due process of law, and the taking of private property for public uses without just compensation.

28. Said Circuit Court of Appeals erred in not reversing the decree of said United States District Court upon the ground that if said act of Congress of March 3, 1899, or any other of the acts of Congress mentioned in

appellee's bill of complaint or relied upon by appellee should be held to establish the character of said Des-Plaines River as navigable, then said acts, and each of them, are and is, unconstitutional notwithstanding the Ordinance of 1787, or any of the acts of Congress for the government of the Northwest Territory.

32. Said Circuit Court of Appeals erred in not following the decision of the Supreme Court of Illinois in the case of *People of the State of Illinois* v. *Economy Light & Power Company* and reversing the decree of said United States District Court upon the ground that said judgment of the Supreme Court of the State of Illinois and the decree of the Circuit Court of Grundy County thereby affirmed was a judgment *in rem* establishing the character of the DesPlaines River as a non-navigable stream notwithstanding the additional flow of water turned into the stream from the Sanitary District channel.

POINTS AND AUTHORITIES AND INDEX TO THE ARGUMENT.

Point I.

THE TITLE TO THE BED OF THE DESPLAINES RIVER AT THE POINT IN QUESTION, IS IN APPELLANT. THE CONTENTION OF THE UNITED STATES THAT IT HAS TITLE THERETO, IS WITHOUT ANY FOUNDATION IN LAW.....38

Testimony of experts as to navigability of Des Plaines.....125
State v. *Economy Light & Power Co.*, 241 Ill., 336.

h.

The opinion in *People* v. *Economy Light & Power Co.*, 234 U. S., 497, indicates that this court did not consider that the Act of March 3, 1899, applied to the DesPlaines River. 127

Willamette Iron Bridge Co. v. *Hatch*, 125 U. S., 1.

Point XII.

THE COURT OF APPEALS WAS LED INTO MANY ERRORS OF FACT, AS TO MOST OF WHICH, THERE WAS NO CONFLICT IN THE EVIDENCE. 129

United States v. *Economy Light & Power Co.*, 256 Fed., 798.

a.

The implication in the finding of the Court of Appeals that commerce was carried on the river prior to 1848, which was then superseded by the opening and use of the canal, is contrary to all the evidence on the subject. 131

b.

There is no evidence that, in the early days, boats of the dimensions given in the opinion of the Court of Appeals, were ever used on the DesPlaines River. 137

c.

The Court of Appeals also erred in the following statement:

"Commerce of this character existed until about the year 1825. After that year, the fur trade, having receded into the interior prtions of Illinois, was reached more generally by horses." 139

d.

The Court of Appeals was in error as to the alleged use of the DesPlaines "from the latter part of the Seventeenth Century through the first third of the Nineteenth Century." 140

Point XIII.

THE DESCRIPTION OF THE DESPLAINES CONTAINED IN THE OPINION OF THE COURT OF APPEALS IS TAKEN ALMOST BODILY FROM THE TESTIMONY OF LYMAN E. COOLEY. THAT TESTIMONY ITSELF IS FULL OF MANIFEST ERROR, AND IS LARGELY COOLEY'S OPINION OF WHAT THE RIVER WAS IN A STATE OF NATURE, NOT WHAT IT IS NOW. THAT OPINION WAS PURE CONJECTURE 143

Point XIV.

ERRORS OF THE COURT OF APPEALS AS TO THE RIVERSIDE GAUGE 151

The readings of that gauge clearly showed, as was pointed out by the Supreme Court of Illinois, that the DesPlaines River not only was not navigable, but that during the season of navigation it was for a considerable portion of the time practically dry.

Point XV.

ERRORS OF THE COURT OF APPEALS AS TO CHANGES IN THE RIVER 155

Druly v. *Adams*, 102 Ill., 177.

Point XVI.

E ACT OF THE GENERAL ASSEMBLY OF THE STATE OF ILLINOIS PROVIDING FOR THE CONSTRUCTION OF THE SANITARY DISTRICT CHANNEL WAS EXPRESSLY FRAMED TO PRESERVE AND PROTECT THE WATER-POWER RIGHTS OF RIPARIAN OWNERS ALONG THE DESPLAINES 157

Point XVII.

TIMONY OF HISTORICAL EXPERTS AND PUBLICATIONS OFFERED IN EVIDENCE 159

Point XVIII.

E EFFECT OF THE DECISION THAT THE DESPLAINES RIVER IS NAVIGABLE IS NOT CONFINED TO APPELLANT. IF AFFIRMED IT WILL NOT ONLY SERIOUSLY AFFECT VAST PRIVATE INTERESTS, BUT THE RIGHT TO MAINTAIN VERY IMPORTANT EXISTING STRUCTURES, NECESSARY FOR THE CONVENIENCE OF THE PUBLIC 164

ARGUMENT.

Point I.

THE TITLE TO THE BED OF THE DESPLAINES RIVER AT THE POINT IN QUESTION, IS IN APPELLANT. THE CONTENTION OF THE UNITED STATES THAT IT HAS TITLE THERETO, IS WITHOUT ANY FOUNDATION IN LAW.

The larger part of the bill of complaint is given up to the assertion of title in the United States to the bed of the Des Plaines River. Although in the opinion of the District Court it was stated that this claim was untenable and it was not referred to in the opinion of the Court of Appeals, it remains in the case, and we cannot know that the United States, which solemnly asserted it in its bill, may not again urge the claim in this Court, and we therefore give it very brief consideration. The grounds upon which such title is claimed, appear in our statement of the pleadings, *supra*. In brief, it is rested upon a provision of the Act of Illinois Legislature of February 26, 1839, providing for the sale and disposal of canal lands, wherein, among other things, it was provided that

> "Lands situated upon streams which have been meandered by the surveys of public lands by the United States, shall be considered as bounded by the lines of those surveys, and not by the stream";

The bill alleges that this amounted to a rejection of so much of the land granted by the United States for canal purposes to the State of Illinois by the Act of March 2, 1827, as consisted of the beds of the streams in question.

In *State* v. *Economy Light & Power Co.*, 241 Ill., 290, the State of Illinois contended that because of this provision of the Act of 1839 the title to the bed of the Des

Plaines remained in it, but the court held that it was in he Economy Light & Power Company.

The United States insists in this cause that the Des Plaines River is a navigable stream. If that were so, he title to its bed would have passed to the State of llinois in 1818, when the State was erected out of the ter- itory. It therefore could not have been part of the rant of March 2, 1827, and could not have been rejected y an Act of the Legislature of Illinois in 1839.

When the United States created states out of terri- ories, all that it retained within the limits of those states ere the public lands. Those lands which were under he navigable waters, were not public lands. They were ands not held by the United States in its proprietary, but n its sovereign, character, and when the state was rected and the sovereignty passed to the State, the title o the beds of navigable streams vested in the State. Whether it remained there, or whether it went into the iparian owner, depended upon the law of the State it- elf, and under the laws of Illinois, it passed into the iparian owner.

It is unnecessary to cite all the numerous cases which ustain this doctrine. Among the federal cases are

Pollard v. *Hagen*, 3 How., 212.
Scott v. *Lattig*, 227 U. S., 229, 242-243.
Donnelly v. *United States*, 228 U. S., 243, 260-261.

A leading case in Illinois is *Braxon* v. *Bressler*, 64 Ill., 488.

Point II.

NAVIGABLE WATERS ARE THOSE WHICH, IN THEIR NATURAL AND ORDINARY CONDITION, ARE USED OR SUSCEPTIBLE OF BEING USED, AS HIGHWAYS OF COMMERCE, OVER WHICH TRADE AND TRAVEL ARE OR MAY BE CONDUCTED IN THE CUSTOMARY MODES OF TRADE AND TRAVEL ON WATER, AND THEY CONSTITUTE NAVIGABLE WATERS OF THE UNITED STATES WITHIN THE MEANING OF THE ACTS OF CONGRESS IN CONTRADISTINCTION FROM NAVIGABLE WATERS OF THE several STATES WHEN THEY FORM, BY THEMSELVES, OR BY UNITING WITH OTHER WATERS, A CONTINUED HIGHWAY OVER WHICH USEFUL COMMERCE IS, OR MAY BE, CARRIED ON WITH OTHER STATES OR FOREIGN COUNTRIES IN THE CUSTOMARY MODES IN WHICH SUCH COMMERCE IS CONDUCTED.

That the above is a correct definition of navigable waters of the United States, need not be supported by argument. It is in substance the definition laid down by this court in *The Daniel Ball*, 10 Wall., 557, and *The Montello*, 20 Wall., 430. It is a rule of general application throughout the United States, and all acts of Congress for the regulation of commerce, must be construed as applying only to waters of the character described. We state the fundamental rule, because from it as a starting point we expect to show that the decisions of the lower courts in the instant case proceed upon a definition of navigable streams, of the United States, which is unknown to the law.

Point III.

THE ACT OF MARCH 3, 1899, UNDER WHICH RELIEF IS ASKED IS OF GENERAL APPLICATION TO NAVIGABLE WATERS THROUGHOUT THE UNITED STATES. THE COURT OF APPEALS BASED ITS JUDGMENT SOLELY ON A DEFINITION OF NAVIGABLE WATERS OF THE UNITED STATES WHICH THE LAW DOES NOT RECOGNIZE, AND WHICH ADMITTEDLY COULD APPLY ONLY WITHIN A LIMITED TERRITORY.

The decree of the trial court, affirmed by the Court of Appeals, contains no finding of fact except that the "said structure described in said bill of complaint as being constructed by said defendant in said river, is a structure erected in violation of the provisions of Section 9 of the Act of March 3, 1899."

This finding was, as the opinion in both courts show, based solely on the supposed effect of the Ordinance of 1787, and early Acts of Congress for the government of the Northwest Territory. The trial court did not, and upon this record could not, find that the Des Plaines River, from the time of the earliest settlement of the adjacent country, down to the entry of the decree, had ever been navigable for purposes of useful commerce. On the contrary, it expressly found that there was

> "no evidence of actual navigation within the memory of living man, therefore, no present interference with navigation by placing obstruction in stream." (p. 3237.)

The Court of Appeals found that the record showed this to be true. (*Economy Light & Power Co.* v. *United States*, 256 Fed., 798.)

The Supreme Court of Illinois in the suit brought by the state against this appellant, decided that the river was not navigable, in a state of nature, and declared that there was not in the entire record a well-authenticated in-

stance in which a boat engaged in commerce navigated the waters of the Des Plaines River. (241 Ill., 309-336.)

We demonstrate in this brief (p. 108) that as to actual use, the records in both cases were in all substantial respects the same, except that there is in the present record additional evidence of attempted use of the river, which strongly confirms the conclusion to which the Illinois Supreme Court came.

The Court of Appeals said:

> "The disposition of this case upon these facts may therefore well be narrowed down to the question: Was the Des Plaines River navigable in its natural condition." (256 Fed. 800.)

and after consideration of that question and referring to cases which concerned "floatable" streams it expressed its conclusion as follows:

> "Under these authorities it seems clear that the Des Plaines River, having been used as an interstate highway of commerce from 1673 to 1825 in the only kind of commerce then existing, is to be deemed of navigable capacity and a navigable stream within the Ordinance of 1787 and the acts of Congress of May 18, 1796, and March 26, 1804, by which Congress specifically took jurisdiction over navigable streams and declared that they should forever remain public highways." (p. 804.)

Thus the Court of Appeals rested its decision, just as did the District Court, upon what it assumed to be the effect of the Ordinance of 1787 and of the statutes for the government of the Territory. We leave out of consideration, in this phase of the discussion, the question whether there is basis in the record for the words "having been used as an interstate highway of commerce from 1673 to 1825 in the only kind of commerce then existing." That will be discussed later.

In the light of this opinion, and of the admitted facts, the inquiry on this branch of the case, narrows itself

wn to this one question: Is the Act of March 3, 1899, rbidding obstructions of navigable streams, to be ap- ied to all streams which, at the date of the Ordinance 1787, and of the early Acts of Congress for the gov- nment of the Territory, were used to any extent what- er by explorers or fur traders? The opinion of the ourt of Appeals as well as that of the District Court akes the one fact of such use, the touchstone in de- rmining whether the Des Plaines River is a navigable ream within the meaning of the Act of 1899, regardless whether it has, or has not, from the earliest settlement the country, afforded a highway for useful commerce, d of practical utility to the public as such.

We shall show that the Act of 1899 is not to be consid- ed in connection with the Acts for the government of e Territory; that those Acts ceased to have any force d effect when the states were erected out of the Terri- ry.

The early acts of Congress referred to are the follow- g:

1. Act of Congress of May 18, 1796, U. S. St. L., Ch. , pp. 464-468, entitled "An Act providing for the sale Lands of the United States in the territory northwest the River Ohio, and above the mouth of the Ken- cky River," Section 9 of which reads, in part, as fol- ws:

> "And be it further enacted, that all navigable rivers within the territory to be disposed of by vir- tue of this act, shall be deemed to be, and remain public highways."

2. The Act of Congress of March 26, 1804, 2 U. S. St. , Ch. 35, pp. 277-283, entitled "An Act making provision r the disposal of public lands in the Indian Territory, d for other purposes," Section 6 of which reads, in rt, as follows:

"That all navigable rivers, creeks and waters, within the Indian Territory, shall be deemed to be and remain public highways."

3. The Act of February 3, 1809, creating Illinois territory, and providing that the inhabitants thereof should enjoy all the "rights, privileges and advantages" of the Ordinance of 1787.

The Ordinance "for the government of the territory of the United States northwest of the River Ohio" provided by Article IV thereof, that

"The navigable waters leading into the Mississippi and Saint Lawrence, *and the carrying places between the same*, shall be common highways, and forever free, as well to the inhabitants of the said territory as to the citizens of the United States, and those of any other states that may be admitted into the Confederacy, without any tax, impost or duty therefor." (U. S. Rev. St., 2d Ed., 1878, p. 13.) (Italics ours.)

To these Acts and to the Ordinance the courts below went to find the definition of the words "navigable river, or other navigable water of the United States," as used in the Act of March 3, 1899. Appellee was compelled to rely on them, because it is not, and cannot be, contended that the river is, or ever has been, navigable for commerce as now carried on, or as it has ever been carried on, since the adjacent country was first inhabited by white men.

A very practical difficulty in using any such test of navigability as the lower courts applied, is this: It assumes that Congress, in passing the Act of 1899—an act of general application—contemplated that for its purposes the navigability of waters in what was formerly the Northwest Territory, to which alone that early legislation referred, must be determined by a definition not applicable anywhere outside of that territory. Manifestly, Congress did not intend that, in apply-

ing the Act of 1899, a stream in Illinois should be included in the term "navigable waters of the United States," and that a stream of precisely the same character and capacity in Massachusetts should not be so included, the distinction being made solely because of the Ordinance and the Acts for the government of the territory. But the courts below adopted, and the appellee asks this court to adopt, a rule of construction of the Act of 1899 which would prevent appellant from building a dam in the Des Plaines River, solely because the Des Plaines River happens to be in the former Northwest Territory, while if it had happened to be in Massachusetts, the factors here held to be controlling, viz: the early Acts and the Ordinance of 1787, could not have any bearing in determining whether it was a navigable river within the meaning of the Act of 1899.

Whether a stream is a navigable water of the United States is, and must be determined by the definition which the federal courts apply to all streams wherever situated within the borders of the United States. That definition was laid down in the early case of *The Daniel Ball,* 10 Wallace, 557, and has been reiterated many times since, as follows:

> "Those rivers must be regarded as public navigable rivers in law which are navigable in fact. And they are navigable in fact when they are used or are susceptible of being used, in their ordinary condition, as highways for commerce, over which trade and travel are or may be conducted in the customary modes of trade and travel on water. And they constitute navigable waters of the United States within the meaning of the acts of Congress in contradistinction from the navigable waters of the states, when they form in their ordinary condition by themselves, or by uniting with other waters, a continued highway over which commerce is or may be carried on with other states or foreign countries

in the customary modes in which such commerce is conducted by water."

In later cases it is held that the commerce must be "a useful commerce." (*The Montello,* 20 Wall., 430.)

We shall later show that under this rule, and the manner in which it has been applied, the Des Plaines River never was a navigable waterway in contemplation of law. We cite it here only to emphasize the point that the courts below brought the Des Plaines River within the scope of a law of general application, by adopting a definition of "navigable water" which is unknown to the law, and which could apply only in a limited territory.

Point IV.

THE COURT OF APPEALS ERRED IN ARRIVING AT THE CONCLUSION THAT THE DESPLAINES WAS A NAVIGABLE STREAM BECAUSE, AS IT HELD, IT WAS OF NAVIGABLE CAPACITY UNDER THE ORDINANCE OF 1787, AND THE STATUTES FOR THE GOVERNMENT OF THE NORTHWEST TERRITORY.

a.

THE ORDINANCE OF 1787, AND THE STATUTES REFERRED TO CEASED TO HAVE ANY EFFECT AFTER THE ADMISSION OF THE STATE OF ILLINOIS IN 1818.

The Ordinance of 1787 and the early Acts of Congress which, according to the Court of Appeals and the District Court, had the effect of perpetually dedicating as highways of commerce, rivers etc., were intended to regulate the territories and were largely limitations of their powers while in a territorial condition. When the territories passed from that condition to statehood, taking their places as equals with the original States, the purposes to be effected no longer existed, because they became subject to all the laws governing the original

es, possessed of the same rights, and bound by no r limitations.

fact by the act of the State of Virginia ceding the thwest Territory to the Union, the United States was nd to admit states formed out of the Northwest Ter- ry, "having the same rights of sovereignty, freedom independence as the other states."

is plainly established by the decisions of the Supreme rt of the United States and of the Supreme Court of ois, that neither the Ordinance of 1787, nor the legis- on for the government of the territories, on which the er courts alone relied, has any force and effect in the te of Illinois.

n *Van Brocklin* v. *State of Tennessee,* 117 U. S., 151, , the court said:

"The articles of confederation ceased to exist upon the adoption of the Federal Constitution; and the Ordinance of 1787, *like all the acts of Congress for the government of the territories,* had no force in any state after its admission into the Union, under that Constitution." (Italics ours.)

n *Hawkins* v. *Bleakly,* 243 U. S., 210, objection was de to a Workmen's Compensation Act on the ground t it dispensed with trial by jury. It was argued first t such right was secured by the Ordinance of 1787. s court, in an opinion by Mr. Justice Pitney, pointed that Iowa was not part of the Northwest Territory, l therefore never subject to the Ordinance. Secondly, as contended that the guaranties contained in the Or- ance were extended to Iowa by certain early acts of ngress. As to this, this court said (page 217):

"This is easily disposed of. The Act of 1838 was no more than a regulation of territory belonging to the United States, subject to repeal like any such regulation; and the act for admitting the state, so far from perpetuating any particular institution pre-

viously established, admitted it 'on an equal footing with the original states in all respects whatsoever.' The regulation, although embracing provisions of the ordinance declared to be unalterable unless by common consent, had no further force in Iowa after its admission as a state and the adoption of a state constitution, than other acts of Congress for the government of the territory. All were superseded by the state constitution. *Permoli* v. *First Municipality*, 3 How. 589, 610; *Coyle* v. *Oklahoma*, 221 U. S., 559, 567, 570; *Cincinnati* v. *Louisville & Nashville R. R. Co.*, 223 U. S. 390, 401."

In *Escanaba Co.* v. *Chicago*, 107 U. S., 678, the Escanaba Co. sought to enjoin the closing of the bridges over the Chicago River between the hours of 6 and 7 in the morning and 5:30 and 6:30 in the evening, pursuant to city ordinance. To avoid the well established rule that, while instrumentalities of interstate commerce which are wholly intrastate are within the paramount authority of Congress, yet until Congress has acted they are within the control of the state, it was contended that Congress had acted, by the adoption of the Ordinance of 1787, Article 4 of which provided that:

> "The navigable waters leading into the Mississippi and St. Lawrence and the carrying places between the same, shall be common highways, and forever free as well to the inhabitants of the said territory, as to the citizens of the United States."

But this Court held that neither the Ordinance of 1787 nor the early legislation for the government of the territories was in force in Illinois unless adopted by her after her admission to the Union.

The Court, by Mr. Justice Field, on page 688, said:

> "The Ordinance was passed July 13, 1787, one year and nearly eight months before the Constitution took effect; and although it appears to have been treated afterwards as in force in the Territory, except as modified by Congress, and by the Act of May 7, 1800, c. 41, creating the Territory of Indiana, and

by the Act of February 3, 1908, c. 13, creating the Territory of Illinois, the rights and privileges granted by the ordinance are expressly secured to the inhabitants of those territories; and although the Act of April 18, 1818, c. 67, enabling the people of Illinois Territory to form a Constitution and State government, and the resolution of Congress of December 3, 1818, declaring the admission of the State into the Union, refer to the principles of the Ordinance according to which the Constitution was to be formed, its provisions could not control the authority and powers of the State after her admission. Whatever the limitation upon her powers as a government whilst in a territorial condition, whether from the Ordinance of 1787 *or the legislation of Congress*, it ceased to have any operative force, except as voluntarily adopted by her, after she became a State of the Union. On her admission she at once became entitled to and possessed of all the rights of dominion and sovereignty which belonged to the original States. She was admitted, and could be admitted, only on the same footing with them. The language of the resolution admitting her is 'on an equal footing with the original States *in all respects whatever.* 3 Stat., 536. Equality of constitutional right and power is the condition of all the States of the Union, old and new." (Italics ours.)

In the instant case the Court of Appeals cited certain references to the Ordinance of 1787 in two Michigan cases, *Moore* v. *Sanborn*, 2 Mich., 519, and *Burroughs* v. *Peshtigo*, 59 Mich., 226; 26 N. W., 491. But it is settled both by the Supreme Court of the United States and the Supreme Court of Michigan that the Ordinance was supplanted by the Constitution of that state. In *The La Plaisance Bay Harbor Company* v. *City of Monroe*, Walker's Chancery, 155, where the provision as to navigable waters and carrying places was in question, it was held that the Ordinance of 1787 was "no part of the fundamental law of the State, since its admission into the Union. It was then superseded by the State Constitution, and such parts of

it as are not found in either the Federal or State Constitutions, were then annulled by mutual consent."

In *Sands* v. *Manistee River Improvement Company*, 123 U. S., 288, it was claimed that a statute of Michigan providing for certain tolls with respect to the Manistee River was unconstitutional as in violation of the Ordinance of 1787. This Court said:

> "There was no contract in the fourth article of the Ordinance of 1787 respecting the freedom of the navigable waters of the territory northwest of the Ohio River emptying into the St. Lawrence, which bound the people of the territory, or of any portion of it, when subsequently formed into a State and admitted into the Union.
>
> The Ordinance of 1787 was passed a year and some months before the Constitution of the United States went into operation. Its framers, and the Congress of the confederation which passed it, evidently considered that the principles and declaration of rights and privileges expressed in its articles would always be of binding obligation upon the people of the territory. The Ordinance in terms ordains and declares that its articles 'shall be considered as articles of compact between the original States and the people and States in the said territory, and forever remain unalterable unless by common consent.' And for many years after the adoption of the Constitution, its provisions were treated by various acts of Congress as in force, except as modified by such acts. In some of the acts organizing portions of the territory under separate territorial governments, it is declared that the rights and privileges granted by the Ordinance are secured to the inhabitants of those territories. *Yet from the very conditions on which the States formed out of that territory were admitted into the Union, the provisions of the Ordinance became inoperative except as adopted by them.* All the States thus formed were in the language of the resolutions or acts of Congress, 'admitted into the Union on an equal footing with the original States *in all respects whatever.*' Michigan, on her admission, became, therefore, entitled to and pos-

sessed of all the rights of sovereignty and dominion which belonged to the original States, and could at any time afterwards exercise full control over its navigable waters except as restrained by the Constitution of the United States and laws of Congress passed in pursuance thereof." (Pages 295-6; italics ours.)

b.

THE COURT OF APPEALS WAS IN ERROR IN STATING IN ITS OPINION THAT THE "SAME PRINCIPLE" AS THAT CONTAINED IN ORDINANCE WAS PRESERVED IN THE ILLINOIS CONSTITUTION.

The Court said (256 Fed., 800):

> "It is immaterial to inquire whether the Ordinance is still in force, or was superseded by the Illinois Enabling Act, or the act of admission, because the same principle is preserved in those statutes, and in the Illinois Constitution."

By the words, "those statutes," the Court refers to the Acts for the government of the Territory, which, as we have pointed out, this Court in the *Van Brocklin* case, *supra*, said "had no force in any state after its admission into the Union under the Constitution."

The principle was not "preserved * * * in the Illinois Constitution." Neither in the Constitution of 1818, or in any succeeding Constitution is the provision of the Ordinance in regard to navigable waters, or any of the early statutes in question, adopted or incorporated.

It has been expressly held both by this Court and by the Supreme Court of Illinois, that the provision in question, whether in the Ordinance or the legislation referred to, did not have any effect after the Constitution of 1818 was adopted. See

Escanaba Co. v. *Chicago, supra.*

In *Dixon* v. *The People*, 168 Ill., 179, and *People* v. *Thompson*, 155 Ill., 451, it is held that the Ordinance has no force in Illinois.

The Court of Appeals in the instant case quotes from the opinion of this court in *The Montello*, 20 Wall., 430, the following:

> "To preserve the natural character of all the rivers leading into the Mississippi and St. Lawrence and to prevent a monopoly of their waters, was the purpose of the Ordinance of 1787 declaring them to be free to the public."

This Court in that case, was considering the regulation of steamboat navigation on the Fox River, which, with the Wisconsin River, from earliest times were navigable rivers in the true sense. We deal with that case more fully in another part of this brief. (*Post*, p. 61.) Here we point out that the situation in Wisconsin was radically different from that in Illinois.

In the Act of Congress of August 6, 1846, to enable the people of Wisconsin territory to form a constitution and a state government and for the admission of such State into the Union, it was provided that:

> "The said State of Wisconsin shall have concurrent jurisdiction on the Mississippi, and all other rivers bordering on the said State of Wisconsin, so far as the same shall form a common boundary to said state and any other state or states now or hereafter to be formed or bounded by the same; and said rivers and waters, and the navigable waters leading into the same, shall be common highways, and forever free, as well to the inhabitants of said state as to all other citizens of the United States, without any tax, duty, impost or toll therefor."

No such provision was contained in the Act enabling the formation of the State of Illinois.

And the Constitution of Wisconsin, adopted pursuant to this Act, contained the following as Section 1, Article 9:

"The River Mississippi and the navigable waters leading into the Mississippi and St. Lawrence, and the carrying places between the same, shall be common highways and forever free, as well to the inhabitants of the state as to the citizens of the United States, without any tax, impost or duty therefor.

In *Wisconsin* v. *Cunningham*, Wis., 15 L. R. ., 561, it was held that the Ordinance and the organic ct which was adapted only to the territorial condition Wisconsin, became obsolete and ceased to have any erative force, except as voluntarily adopted by her ter she became a state of the Union.

But even where provisions of the Ordinance have been dopted as part of the organic law of the state, it has ever been held that any Act of Congress for the regu- tion of commerce applied to streams which were not in ct navigable for the purposes of useful commerce, at e time of the passage of such Act, and in *State* v. *Carenter*, 68 Wis., 165, it was held that, notwithstanding the corporation of the Ordinance into the Constitution of Visconsin, an injunction would not issue to prevent the rection of a structure in a river which had ceased to be f any practical use for commerce. We shall refer to this ase at greater length hereafter.

Counsel argued in the court below that Congress, hav- ng determined to preserve the public character of the avigable rivers in the Northwest Territory, it was not ithin the competency of the State to abrogate its ac- ion. No such question is presented in the record. The State has not attempted to abrogate the action of Con- gress. Those Acts ceased to have any effect by the mutual consent of the people of Illinois and the United States hen the State was organized.

Counsel cited in the lower court, in this connection, *United States* v. *Sandoval*, 231 U. S., 28, 38. *Coyle* v. *Oklahoma*, 221 U. S., 559, 574. Neither case has any

bearing. The *Sandoval* case was a proceeding by indictment for introducing liquor into the Indian country, contrary to the Act of January 30, 1897; that Act was not one for the government of Indians in any particular Territory, but it applied to the Indians, who were the wards of the Nation, upon Indian lands wherever situated. Nor question of equality between a newly admitted State and an old State, could arise under it. The sole question, as stated by Mr. Justice Van Deventer, was (p. 38)

> "whether the status of the Pueblo Indians and their lands is such that Congress competently can prohibit the introduction of intoxicating liquor into those lands notwithstanding the admission of New Mexico to statehood."

The Enabling Act had provided that the terms "Indian" and "Indian Countries" should include the Pueblo Indians in New Mexico. The court rehearsed the history and condition of those Indians and their title to the lands, and came to the conclusion that the status of the Pueblo Indians, and their land, was such as to bring them within the power of Congress to exercise jurisdiction over the Indians and their affairs. It was pointed out by the court that this power was rightfully exercised by the United States "over all dependent Indian communities within its borders, *whether within its original territory or territory subsequently acquired, and whether within or without the limits of a State.*" (p. 46.) And further:

> "Being a legitimate exercise of that power, the legislation in question does not encroach upon the police power of the State or disturb the principle of equality among the States." (p. 49.)

The case of *Coyle* v. *Oklahoma, supra,* concerned the right of the State to remove its capital. The opinion reviews the authorities upon which we rely and sustains the principle that "each State must be admitted upon an equality with all other States."

Point V.

THE COURT OF APPEALS FAILED TO DISTINGUISH BETWEEN STREAMS HELD TO BE "FLOATABLE" UNDER THE LAWS OF CERTAIN OF THE STATES, AND NAVIGABLE WATERS OF THE UNITED STATES, SUBJECT TO THE CONTROL OF CONGRESS UNDER THE COMMERCE CLAUSE OF THE CONSTITUTION, AND IN CONSEQUENCE ADOPTED AN ERRONEOUS DEFINITION OF "NAVIGABLE WATERS OF THE UNITED STATES."

The opinion of the Court of Appeals discloses a fundamental misconception of what Mr. Justice Miller, in considering what are navigable waterways of the United States, referred to as "the great point of the navigability of streams of the United States concerning interstate and international commerce." This misconception is markedly evidenced by the following reference by the Court of Appeals to *Brown* v. *Chadbourne*, 31 Me., 9:

> "The statement, 'A way over which one has a right to pass, may be periodically covered with water,' gives rise to the suggestion that a river in the latitude of the Des Plaines is ordinarily frozen over during some of the winter months, and in a new country where the roads, if any, are very poor and inadequate, such a river would afford an excellent highway at least in many places, for teams drawing sleighs." (256 Fed., 803.)

It appears from the opinion as a whole that a stream over which sleighs could be drawn in winter, and down which logs could be floated in other parts of the year, would in the judgment of the Court of Appeals, be a navigable waterway of the United States, provided always that it happened to be in what was formerly the Northwest Territory.

The necessary result of the application made by the court of the Ordinance of 1787 and the early statutes is that every stream, over which, prior to 1787 men passed

in skiffs or canoes, or indeed down which logs could be floated, within the territory to which the Ordinance referred, must for all time be deemed navigable waters of the United States within the meaning of the Commerce clause of the Constitution and subject to all statutes for the control of interstate commerce which might be enacted thereunder, regardless of whether or not such streams were susceptible of valuable use for commerce.

The Court of Appeals saw that this was the logical and necessary conclusion of its reasoning and in paragraphs 5, 6, of its opinion (256 Fed., 802) it collected together a number of cases from the courts of various States to sustain this proposition. Most of the cases have to do with the question of the right to float logs in certain small streams. Such cases are:

Gaston v. *Mace*, 33 W. Va., 14; 5 L. R. A., 392.
Stratton v. *Currier*, 81 Me. (incorrectly cited as 81 Mo.), 497.
Moore v. *Sandborne*, 2 Mich., 519.
Wadsworth, Adm'r., v. *Smith*, 11 Me., 278.
Brown v. *Chadbourne*, 31 Me., 9.
Lewis v. *Coffey County*, 77 Ala., 190.
Morrison Bros. & Co. v. *Coleman*, 87 Ala., 655.
Carter v. *Thurston*, 58 N. H., 104.
Kamm v. *Normand*, 50 Or., 9.

The Court overlooked the well recognized fact that streams may be deemed navigable or floatable under local laws for certain purposes and yet not be navigable waterways of the United States.

Mr. Justice Miller, in *Duluth Lumber Co.* v. *St. Louis Boom & Improvement Co.* (17 Fed., 419), distinctly emphasizes the point we are now making. That case concerned the St. Louis River, a much more important stream than the Desplaines, for it was actually navi-

gated by small water craft, even including steamboats, at the time the case arose. Mr. Justice Miller said:

> "It is proper to say that many statutes of many states for the very purpose of preserving these small streams for the use of sawlogs and various kinds of small water craft, declare such streams navigable. There is hardly a stream in the western country that can float a log that has not, by statute of the state, been declared to be navigable to prevent people from putting dams across it; *but that has nothing to do with the great point of the navigability of streams of the United States concerning interstate navigation or international navigation.* Those are statutes made by the states for their own uses, and they can declare, and often do declare, that a little branch is a navigable stream. That does not make it so within the meaning of any constitutional provision, treaty, or ordinance of the United States." (pg. 424, italics ours.) (See, also, *State* v. *Carpenter,* 68 Wisc. 165.)

A reading of the opinions in certain of the cases cited by the Court of Appeals in the instant case shows that the judges who gave those opinions did not overlook the distinction in question. They did not intend to hold, or understand that they were holding, that "floatable streams" were "navigable waters of the United States." Thus, in the first case cited by the Court of Appeals in this connection, *Gaston* v. *Mace, supra,* the court pointed out that the stream there in question, though floatable, was not a navigable stream capable of being navigated by boats or lighters and on which commerce might be carried on.

The court said (5 L. R. A., 396):

> "In the United States there are three classes of navigable streams: (1) tidal streams that are held navigable in law whether navigable in fact or not; (2) those that, although nontidal, are yet navigable in fact for boats or lighters, and susceptible *for*

valuable use for commercial purposes; (3) tho streams which, though not navigable for boats lighters, are floatable or capable of valuable use bearing logs, or the products of mines, forests a tillage of the country they traverse, to mills or ma kets. * * *

The very definition of the third class of navigal streams shows that these streams would not be cluded in the common-law definition of a naviga stream,—that is one in which the tide ebbs a flows,—nor could it come within the civil law defi tion of a navigable stream, which is capable of ing navigated by boats or lighters, and on wh commerce may be carried on.

The third class of navigable streams are genera called floatable streams; and though the public ha right to use them as a public highway by floati logs and other products of forest, mines and till down these streams to mills and market, yet the parian owners along such streams own the bed them as well as their banks, differing in this resp from other navigable streams." (Italics ours.)

Likewise, in *Heyward* v. *Farmers Mining Compa* (42 S. C. 138, 19 S. E., 963), also referred to by the Co of Appeals, the court distinguished between naviga streams under the control of the states and such navi ble waters of the United States as were subject to laws of interstate commerce. In that case, the co in holding that the trial court was in error in enume ing certain conditions as necessary to the navigabi of a stream, one of the conditions being that it m make connections with other highways, said:

> "This test has only been applied in cases wh the question was whether a stream was a navig water of the United States. There are certain ditions to be considered in determining the nav bility of waters of the United States, so as to ject them to the laws of interstate commerce, do not apply to navigable streams under the con of the state. Among these conditions is that r tioned by the circuit judge." (p. 152.)

The Court of Appeals, in applying the test of the capacity of a stream for floatage of lumber, cited *Moore* v. *Sandborne* (2 Mich., 520), which was an action to recover damages for obstructing Pine River, a small stream of limited capacity for floating; but the Supreme Court of Michigan recognized the distinction between such floatable streams and navigable waterways of the United States in *City of Grand Rapids* v. *Powers* (50 N. W., 661; 89 Mich., 94, page 111). The court said:

> "Whatever may be the power of the legislature in waters 'strictly navigable' to fix an arbitrary line beyond which riparian owners cannot go, or to delegate to a municipality that power, I am satisfied that no such right exists in the waters of Grand River at the rapids, or certainly in that part of the waters which are *not now navigable* for any purpose. The rights of the riparian owner, under our laws, is subject only to the public use for the purposes of navigation; and there is a manifest difference between public streams that can be used successfully for the running of boats and vessels for the purpose of commerce, and those which are only capable of being used for the floatage of lumber and logs in rafts or single pieces. The riparian owners are entitled to the beneficial and sole use of the latter streams, except for floatage; *and when such streams have become unfitted for valuable public use, and have actually ceased to be used for public highways, there is no more reason for holding them to be public than in the case of a land highway which has been abandoned and is useless.*" (Italics ours.)

This right of floatage, which has nothing to do with navigation, under the laws of the United States, is protected only in states where there are interests which require such protection. In Illinois it has never been recognized. Thus in *Hubbard* v. *Bell* (54 Ill., 110), it was held that the fact that a river was capable of floating logs at certain seasons did not render it subject to the *jus publicum* even for that purpose. The court,

referring to the contention of counsel that the stream in question was subject to such use, said:

> "The principle is distinctly asserted that the public have the right to the free use of all streams which are susceptible of any valuable floatage. * * *
>
> However necessary it may be in the great lumbering States of Maine and Michigan that private rights should yield to prevailing interest, no such interest exists in this state, and we shall be careful that the rights of its citizens shall not be wrongfully invaded upon such pretenses as are set forth in this record, and sustained by such considerations as influenced the judgments of the courts whose opinions we have considered." (p. 118.)

In *Schulte* v. *Warren* (218 Ill., 108), the court referred to *Hubbard* v. *Bell*, saying:

> "In this state the public have an easement for the purpose of navigation in waters which are navigable in fact, regardless of the ownership of the soil, and the question whether these waters are navigable depends upon the question whether they are of sufficient depth to afford a channel for useful commerce. In some states where lumber interest has been regarded of first importance the courts have held that waters which are capable of floating logs are navigable; but in *Hubbard* v. *Bell* (54 Ill. 110), this court declined to adopt this rule and adhered to the doctrine that *navigable waters must be capable of practical general uses.* The rule stated by Lord Hale in his treatise *De Jure Maris* that the stream to be navigable must furnish 'a common passage for the King's people' must be 'of common or public use for the carriage of boats and lighters,' must be capable of bearing up and floating vessels for the transportation of property conducted by the agency of man, was approved. (*Joliet and Chicago Railroad Co.* v. *Healy*, 94 Ill. 416.)
>
> A stream is navigable in fact only where it affords a channel for useful commerce and of practical utility to the public as such. The fact that there is water enough in places for rowboats or small launches answering practically the same purpose, or that hunters and fishermen pass over the water with boats ordinarily used for that purpose, does not render the waters navigable." (Page 119; italics ours.)

Point VI.

THE FOX RIVER REFERRED TO IN THE MONTELLO CASE, IN ITS NATURAL CONDITION AND AFTER THE SETTLEMENT OF THE COUNTRY, WAS LARGELY USED FOR COMMERCE. THE DESPLAINES WAS NOT TO ANY EXTENT WHATEVER. THE PHYSICAL CHARACTERISTICS OF THE FOX AS COMPARED TO THOSE OF THE DESPLAINES EXPLAIN THE MARKED DIFFERENCE IN THE HISTORY OF THE USE OF THE TWO STREAMS.

The Court of Appeals referred to *The Montello,* 20 Wall., 440, and that case has largely been relied upon both by the appellee and the State of Illinois in the litigation concerning the proposed dam. The Fox River there in question and the DesPlaines have nothing in common in physical characteristics and little in historical conditions. From the earliest times the former river was a channel for useful commerce and the *Montello* suit itself arose out of the question whether steamboats navigating its waters were subject to governmental regulations. Not even a gasolene launch has ever navigated the waters of the DesPlaines.

In *The Montello* the court said (20 Wall., 440):

> "In more modern times, and since the settlement of the country, and before the improvements resulting in an unbroken navigation were undertaken, a large interstate commerce has been successfully carried on through this channel. This was done by means of Durham boats, which were vessels from seventy to one hundred feet in length, with twelve feet beam, and drew when loaded two to two and one-half feet of water. These boats, propelled by animal power, were able to navigate the entire length of Fox River, with the aid of a few portages, and would readily carry a very considerable tonnage."

In the case of the DesPlaines the record shows not one instance since the days of settlement, of the use of the

river for any commerce. The use of the one, and the failure to use the other, are easily understood when the physical characteristics of the two are compared. A Government report shows that the Fox River up to the portage to the Wisconsin, is 154½ miles in length, fifteen miles being through Lake Winnebago, which has a depth of twenty feet; that the river itself, except at the point where the rapids, hereinafter to be mentioned, occur, for the most part *had no perceptible current, the slope being slight,* and *except at one or two places where the bottom was soft sand, the general depth of the upper river, at an ordinary height of water, was between four and five feet.* The obstructions in its natural state were rapids, falling 170 feet in 28 miles, and 88 feet of these were in two falls, and, in the natural condition of the river the only portages required, being around these falls, *aggregated less than a mile.* The depth of the lower Fox—and it was in this portion that the rapids appeared—was from eight to ten feet, and the variation in depths during the year, was not more than three or four feet, so that there was at least a depth of from four to six feet at any stage of the water. (Abst., 3035, 3040.)

The DesPlaines River is over 100 miles in length. No claim is made that the upper river is, or ever has been, navigable. We have described the lower portion in the statement of facts. It is a series of rapids and pools. The Supreme Court of Illinois in *State* v. *Economy Light & Power Co.,* said:

> "The bottom of the river from Lockport to the dam in question, with the exception of that portion under Lake Joliet, is covered with a large number of boulders. The bottom of Lake Joliet is soft. The evidence shows that these boulders are of various sizes, some of them between two and three feet in diameter. Some of them are covered entirely with water, while others project slightly above the sur-

face of the water. It is also shown that in going down the river in a skiff or any kind of boat there is great danger of coming in contact with these boulders. The current is so strong that it is not possible to row a boat upstream over these rapids. In addition to the natural barriers already spoken of, the evidence shows that the stream is tortuous and the channel very narrow at places. The slopes in the river already given do not represent the greatest fall that can be found in this stretch. The evidence shows that there is near the head of Treat's Island a fall of seventeen feet to the mile, and near the foot the slope is eighteen feet to the mile, and in the right-hand channel opposite Treat's Island there is a space of five hundred feet in which the fall is fifty feet to the mile, and if shorter distances are taken even greater slopes than these will be found to exist. At one place near the mouth of the river there is a fall for three or four hundred feet of twenty feet to the mile."

The Supreme Court of Illinois also found from e gauge readings at Riverside that there were om 24 days in 1890 to 213 days in 1895 dur- g which the river was dry at the Riverside uge, Riverside being 28 miles above Joliet. id further, "that there were many days when there is less than six inches of water at Riverside, so that e dry days and the days showing less than six inches scharge were from 120 days in 1888 to 300 in 1901.

We shall have occasion later to refer to the significance the Riverside gauge readings.

The distinction made by this court in *United States* v. *Grande Dam and Irrigation*, 174 W. S., 690, between Fox River and the Rio Grande, is even more appli- ble to the DesPlaines as compared to the Fox. This rt said (p. 699):

"Obviously, the Rio Grande within the limits of New Mexico is not a stream over which in its ordi- nary condition trade and travel can be conducted in

the customary modes of trade and travel on water. Its use for any purposes of transportation has been and is exceptional, and only in times of temporary high water. The ordinary flow of water is insufficient. *It is not like the Fox River, which was considered in The Montello, in which was an abundant flow of water and a general capacity for navigation along its entire length, and although it was obstructed at certain places by rapids and rocks, yet these difficulties could be overcome by canals and locks*, and when so overcome would leave the stream in its ordinary condition, susceptible of use for general navigation purposes. We are not, therefore, disposed to question the conclusion reached by the trial court and the Supreme Court of the Territory, that the Rio Grande within the limits of New Mexico is not navigable." (Italics ours.)

Point VII.

THE RIGHT OF CONGRESS TO LEGISLATE AT ALL ARISES UNDER THE COMMERCE CLAUSE OF THE CONSTITUTION, WHICH DOES NOT APPLY TO SUCH STREAMS AS THE DESPLAINES. IF THE ACT OF 1899 APPLIES TO THAT STREAM IT IS VOID. THE COURT OF APPEALS ERRONEOUSLY HELD THAT THE RIGHT TO SO LEGISLATE MIGHT ARISE UNDER THE WAR POWERS OF CONGRESS.

The answer of appellant as amended avers that the purpose of the Act of March 3, 1899, is to protect existing commerce, and that there is no commerce on the Des Plaines River to be protected, and that the Act does not apply to it (p. 3235); and that the river is not in fact capable of navigation for purposes of useful commerce, and that neither Section 8, Article 1 of the Constitution of the United States, nor the Act of Congress of March 3, 1899, or any other Act of Congress, is applicable to such stream. It is further averred that if the Act of 1899, or any Act of Congress mentioned in the bill, or relied upon, should be held to establish the character of

DesPlaines as navigable, then said Acts, and each of
n are, and is, unconstitutional. It further insists that
he Act of 1899, or any other Act of Congress, applies
he DesPlaines, the same are null and void under the
visions of the Fifth Amendment to the Constitution
he United States, forbidding the taking of property
hout due process of law, and the taking of private
perty for public use without just compensation (pp.
5-3236).

The Court of Appeals, in the opinion in the instant
e, in effect denies that the right of Congress to legis-
e at all arises only under the Commerce clause of the
nstitution. In its opinion (256 Fed., 799) appears
following:

"It is argued that the Act of 1899 was passed under
the constitutional power to regulate interstate co-
merce and as no such commerce on the DesPlaines
then existed, the statute can have no application, and
that if the statute be construed to reach beyond this,
it was to that extent beyond the legislative power.
Even so it might be sustained under the war power.
We have lately had a significant reminder of the in-
adequacy of railroad transportation in time of
stress." (Italics ours.)

There is little that Congress may not do in time of
r, under its war powers. The implication in the por-
n of the opinion just quoted, that in time of peace its
ht to regulate railroads, rivers and other means of
erstate commerce, may be referred to, and based on
se powers, is startling and has no warrant in any
ision which we have been able to find. If it were
nd doctrine the safeguards of property and human
erty, which the Constitution contains, would largely
impaired.

That the power of Congress to enact such legislation as
Act of March 3, 1899, arises only out of the Commerce

clause of the Constitution has been repeatedly stated by this Court. Chief Justice Marshall in *Gibbons* v. *Ogden*, 9 Wheat., 1 (p. 190), said:

> "If commerce does not include navigation the government of the Union has no direct power over that subject."

In *Monongahela Navigation Co.* v. *United States*, 148 U. S., 312, 335, Brewer, J., said:

> "Upon what does the right of Congress to interfere in the matter rest? Simply upon the power to regulate commerce."

To the same effect is *United States* v. *Cress*, 243 U. S., 316.

This Court has pointed out that

> "what the Constitution and the Acts of Congress have in view is the promotion and protection of commerce in its international and interstate aspect, and a practical construction must be put on these enactments as intended for such large and important purposes."
>
> *Leovy* v. *United States*, 177 U. S., 621-633.

It seems a necessary conclusion that Congress in passing any Act under this power to regulate commerce, must have had in mind, and its constitutional power must be limited to, commerce as carried on at the time of the passage of the Act, and that any such Act must be construed as applying only to waters of the United States, navigable in fact for commerce as then conducted.

The trial court and the Court of Appeals in the instant case determined that the Act of March 3, 1899, applies to the DesPlaines River, by a test which as we have shown wholly disregards this view and which attributes to Congress a power which it does not possess. Under the "practical construction" of the Constitution which this Court held to be the proper one, Con-

gress had power by the Act of 1899, to protect and regulate commerce as then existing, upon streams then in fact navigable. But it had no power to measure navigability by going back a century and taking in every stream, brook, or creek over which early fur traders, explorers, or adventurers, driven by dire necessity, managed to force their canoes or other frail craft. The lower courts, however, predicated their decisions not alone upon the existence of such power in Congress, but upon a curious extension of it. According to their reasoning, Congress had the power to bring within the scope and application of the Act of March 3, 1899, streams in the Northwest Territory, while it could not have applied it to streams of the same character in the original states. We submit that if Congress, in passing the Act of 1899, intended as the test of navigability of streams in the old Northwest Territory, the use which was made of them in 1787, or 1804, or 1809, and for streams outside of that Territory, the test of navigability laid down by the Supreme Court in the *Montello case,* 20 Wall., 430—

> "to give it the character of a navigable stream, it must be generally and commonly useful to some purpose of trade or agriculture"—

then the Act, as applied to the former streams at least, would have been void. But it would be extremely unfair to Congress to attribute to it any such intention.

The Supreme Court in the *Leovy* case, *supra,* gave its understanding of what Congress meant, when, in referring to the Act of 1890, it said:

> "It is a safe inference from these and other cases to the same effect which might be cited, that the term 'navigable waters of the United States' has reference to commerce of a substantial and permanent character to be conducted thereon." (p. 632.)

We further contend that even though the DesPlaines River had been of navigable capacity, yet because there

is not, and has not been, within the memory of any living witness, nor within the historical period of the settlement of the country, any commerce upon this river, Congress was without power to pass any law which would require the riparian owner to procure a permit to erect a dam in a stream, to the bed of which he held title.

A very important and disastrous result of any such construction of the Commerce clause as the Court of Appeals has given it in the instant case, and of such Acts as that of March 3, 1899, is indicated in the opinion of the Supreme Court of Michigan, in *Valentine* v. *Berrien Springs Water Company,* 128 Mich., 280; 87 N. W., 370, 374, where the court, in discussing the question whether or not dams and other obstructions might be placed in the St. Joseph River, said:

> "The future prosperity of many places in the State is largely dependent upon the use which may be made of rivers of this character. If dams cannot be built and power (the cheapest in the world) thus furnished, water supplied, and the navigation of rivers improved, these cities, villages and country towns will lose the greatest benefits which nature has placed within their reach."

The title to the bed of the stream was in appellant, regardless of whether it was or was not a navigable stream.

State v. *Economy Light & Power Co., supra.*
Schulte v. *Warren,* 218 Ill., 108.
Lorman v. *Benson,* 8 Mich., 18.
City of Grand Rapids v. *Powers* (Mich.), 50 N. W., 661, and cases therein cited.

Having title, the owner may do with it as he chooses, provided he does not obstruct navigation, or damage other riparian owners along the stream above or below him.

Grand Rapids v. *Powers, supra.*
City of Kewanee v. *Otley,* 204 Ill., 402.
Yates v. *Milwaukee,* 10 Wall., 497.

That property right can only be invaded under the Commerce clause in so far as may be essential to protect an existing easement for navigation.

So far as the United States is concerned, the riparian owner holds his title subject only to the Constitutional power of the Government to regulate, and prevent the obstruction of commerce. It possesses no other power to interfere. But regulation, or obstruction, of commerce presupposes the existence of commerce.

In *United States* v. *Rio Grande Irrigation Co.*, 174 U. S., 690, at p. 709, in discussing the right of the Attorney General to proceed under the Act of 1890, which was a similar statute, the Supreme Court said:

> "The question is always one of fact, whether such appropriation substantially interferes with the navigable capacity, within the limits where navigation is a recognized fact."

No case will be found where the right of Congress to interfere has been sustained except to protect existing commerce. Mr. Taft, as Secretary of War, in regard to this very dam, said if the DesPlaines River had been navigable, and application had been made for approval of the plans of the dam, if the Department concluded that it would not interfere with navigation, then it was not within the power of the Department to withhold a permit. This could only mean that under such circumstances, there would have been no Constitutional *power* in the government to prevent the obstruction. (Abst., 1937.)

In *Leovy* v. *United States*, 177 U. S., 621, 637, this Court said that because

> "Red Pass, in the condition it was at the time this dam was built, was not shown by adequate evidence to have been a navigable water of the United States, *actually used in interstate commerce*"

the court should have charged the jury in favor of the defendant.

In that opinion (page 633) the Supreme Court criticized the instructions of the trial court, because under them all streams upon which a skiff or small lugger could float, would constitute navigable water of the United States, and clearly intimated that under such a construction, Congress would have had no Constitutional power to enact such a statute. It said:

> *"If such were the necessary construction of the statutes here involved, their validity might well be questioned."*

In the court below counsel argued that the opinion of the Supreme Court in the *Leovy* case, had no bearing on the instant case, because of a difference in the Acts under which the two proceedings were brought. They pointed out that the indictment in the former case was under the Act of September 13, 1890, prohibiting the obstruction of commerce, while the instant case was brought under the Act of March 3, 1899, to prevent the placing of an obstruction in navigable waters.

Their contention seemed to be that the *Leovy* case has no weight in determining the present issue, because the Act of March 3, 1899 does not refer to the obstruction of commerce, but prohibits the building of obstructions in navigable rivers. Counsel ignored entirely the reasoning by which this Court arrived at its conclusion. They further ignored the fact that in that case the Government *"contended that the policy of Congress in respect to the authority of the Secretary of War in the matter of obstruction to navigation, has been greatly changed and modified by the Act of March* 3, 1899" (177 U. S., 637), and that this Court said that in the view that it took of the case it was not called upon to express an opinion on that question. The view, there referred to, appears on

pages 632 and 633 of the opinion. This Court's remarks concerned the proper definition of the words "navigable water of the United States," and they are equally applicable to a proceeding under either Act. The instruction which the trial judge gave was quite in line with the contentions of the counsel for the Government in the instant case, and as to it this Court said:

> "If these instructions were correct, then there is scarcely a creek or stream in the entire country which is not a navigable water of the United States. Nearly all the streams on which a skiff or small lugger can float discharge themselves into other streams or waters flowing into a river which traverses more than one state, and the mere capacity to pass in a boat of any size, however small, from one stream or rivulet to another, the jury is informed, is sufficient to constitute a navigable water of the United States.
>
> Such a view would extend the paramount jurisdiction of the United States over all the flowing waters in the states, and would subject the officers and agents of a state, engaged in constructing levees, to restrain overflowing rivers within their banks, or in regulating the channels of small streams for the purposes of internal commerce, to fine and imprisonment, unless permission be first obtained from the Secretary of War. If such were the necessary construction of the statutes here involved, their validity might well be questioned. But we do not so understand the legislation of Congress. *When it is remembered that the source of the power of the general government to act at all in this matter arises out of its power to regulate commerce with foreign countries and among the states, it is obvious that what the Constitution and the acts of Congress have in view is the promotion and protection of commerce in its international and interstate aspect, and a practical construction must be put on these enactments as intended for such large and important purposes.*
>
> We also think that these instructions are open to the further criticism that they contain no reference to the nature or extent of the traffic or trade carried on in Red Pass before the erection of the dam. In-

> deed, the charge necessarily implies that the defend ant was guilty if there was merely a capacity fo passing from Red Pass into theMississippi River o any sort of a boat. Very different was the view ex pressed by Chief Justice Shaw when he said it i not 'every small creek in which a fishing skiff o gunning canoe can be made to float at high water which is deemed navigable, but in order to give it th character of a navigable stream it must be generall and commonly useful to some purpose of trade o agriculture. (21 Pick., 344.)" (p. 633; italics ours.

In the early days the Great Miami River was fre quently used by explorers and fur traders. In *Koehn* v. *City of Dayton*, 77 Ohio St., 341, 119 N. E., 651, th plaintiff sought to enjoin the City of Dayton from con structing a dam in the bed of that river claiming that i was a navigable stream. In the Court of Appeals o Montgomery County an opinion was rendered March 14 1917, certified copy of which we have, in which it was hel that the Great Miami River at Dayton was not a navi gable river, saying:

> "We find from an examination of the authoritie that the question of the navigability of a stream i one of fact to be determined from the evidence de scribing its condition at the time of the inquiry an during a reasonable period of time prior to the in quiry."

The Supreme Court of Ohio affirmed the opinion hold ing that the Great Miami was not a navigable stream a the point stated and that the construction of the dam would not in anywise impede or impair navigation.

Point VIII.

THE COMMERCE CLAUSE OF THE CONSTITUTION DOES NOT APPLY TO A STREAM WHICH IS WHOLLY WITHIN THE LIMITS OF ONE STATE AND WHICH DOES NOT, BY A NAVIGABLE CHANNEL, CONNECT WITH WATERS MAKING IT AVAILABLE FOR INTERSTATE COMMERCE.

In *Veazie* v. *Moor,* 14 How., 568, the Supreme Court considered the validity of an act of the Legislature of the State of Maine giving to one Moor the exclusive right to run steamboats on the Penobscot River. This was attacked as in violation of the Commerce clause of the Constitution. The Penobscot is entirely within the limits of Maine, and eight miles from its mouth it passed over a fall and was crossed by dams, and for that space, was not, and never had been, navigable. A canal of eight miles, or the improvement of the river, would have opened the Penobscot to the sea, but it was held by the Supreme Court that the Penobscot was not a navigable stream, and that the Commerce clause of the Constitution did not apply to a river of that kind.

When the *Montello* case, 11 Wall., 411, was first before the Supreme Court, it was sent back, because, though it appeared that the Fox River was used by steamboats for transporting products of Wisconsin, it did not appear that it was navigable to Lake Michigan, and until that was shown, it could not be declared to be a navigable water of the United States.

While the DesPlaines has its source in Wisconsin, no serious claim is made, and no evidence was introduced to show, that in that State it ever had been, or could be used, even by canoes. Even if the DesPlaines were navigable from Lockport to its mouth it would not be a navigable water of the United States, for, as we shall show, the upper Illinois is not, and never was, navigable.

Point IX.

"WHEREVER IN THE COURSE OF A STREAM, IT CEASES T BE A PUBLIC HIGHWAY FOR COMMERCE BETWEEN THI AND OTHER STATES AT THAT POINT ITS NATIONAL CHA ACTER TERMINATES AND ABOVE THAT IT IS WITHI THE EXCLUSIVE JURISDICTION OF THE STATE."

The language of this heading is quoted from *Neade houser* v. *Indiana*, 28 Ind., 257, where the court was co sidering whether or not a certain portion of the Wabas was a navigable stream.

By the bill in the instant case it is claimed that th Sanitary District Canal, the DesPlaines and the uppe Illinois constitute a continuous waterway. Neither th upper Illinois, the DesPlaines nor the Sanitary Distri Canal are navigable waters of the United States. Th is true under the doctrine of *Veazie* v. *Moor*, 14 How 568; the *Montello* case, 11 Wall., 411; the *Neaderhous* case just cited; *United States* v. *Rio Grande Irrigatio Co.*, 174 U. S., 690; and *Commonwealth* v. *King*, 150 Mass 221. The decision of each of those cases was governe by the doctrine that whenever a stream ceases to be na igable, it is no longer within the maritime jurisdiction the United States. The Illinois ceased to be navigab far below the mouth of the DesPlaines.

a.

THE UPPER ILLINOIS IS NOT NAVIGABLE.

The upper Illinois above LaSalle was never a navigab stream. This fact has been officially recognized by th United States, the State of Illinois and the Commissio ers of the Sanitary District, both before and since th waters of Lake Michigan were added to the DesPlain and the Illinois.

LaSalle in 1682, stated that in the summer "there is no water at all in the river as far down as Fort St. Louis (Starved Rock near Ottawa), where the navigation of the Illinois River begins, at this season, and extends as far as the sea." (Abst., 257, 295.) And also that "It would be easier to effect transportation from Fort St. Louis to the lake by land, using horses, which it is easy to get there." (Abst., 1724.)

And St. Cosme, writing at about the same time, and referring to Fort St. Louis, said "Here navigation begins." (Abst., 50.)

Practically the same point fixed by these early explorers has been recognized in the reports, both State and Federal, as the head of navigation on the Illinois. The first official report was made by Major S. H. Long in 1816, who stated that the Illinois was navigable "about 230 miles from its mouth." (Abst., 110.)

Post and Paul, in 1824, referred to the head of the navigable waters of the Illinois River as being at the Little Vermilion. This is far below the mouth of the DesPlaines. (Abst., 2425.)

The Act of Congress of June 13, 1902, provided for a report of plans and estimated cost "for a navigable waterway of seven and eight feet depths, respectively, from the *head of navigation of the Illinois River at LaSalle,* Illinois, through said river to Ottawa, Illinois." (32 U. S. Stats. at Large, p. 364.) It is significant that Congress here recognizes the fact that LaSalle was the head of navigation in 1902, and that notwithstanding the waters from Lake Michigan had then been added, improvements would be necessary in order to obtain even a seven or eight-foot depth between Ottawa and LaSalle.

We have elsewhere in this brief (p. 120) made ref-

erence to the numerous reports of engineers proving that navigation on the Illinois ceased at, or about, LaSalle.

The Legislature of Illinois early recognized that the Illinois River above LaSalle was not navigable, that it was doubtful whether it was wise to attempt to improve it for navigation from that point to Ottawa, and that above Ottawa a canal would be required as a matter of course. This was evidenced by the Act of February 15, 1831, which authorized the Canal Commissioners to employ an engineer to examine the Illinois River from the mouth of the Fox River down to the head of steamboat navigation;

> "and if, in their opinion, the navigation of the Illinois River can be improved by dams and locks, or otherwise, so as to secure its navigation as far upwards as the mouth of the Fox River, with as little expense, and as much utility, as canaling from the Fox River to the Little Vermillion, or foot of the rapids, they shall have power to terminate said canal at the mouth of the Fox River." (Laws of Illinois, 1831, p. 42.)

That the construction of the Sanitary District Canal and the introduction of Lake Michigan water through it, would not make the upper Illinois or DesPlaines navigable, was recognized by a joint resolution of the Illinois Legislature, adopted May 27, 1897. It contained the following recital:

> "Whereas, the construction of the Sanitary Canal of Chicago and the large volume of water required to flow through the same will bring lake and river navigation, *which are now* 320 *miles apart, within sixty miles of each other,* and the development of the intermediate section between Lockport and Utica will furnish a through route from the Great Lakes to the lower Mississippi by way of the lower Illinois River, and to the upper Mississippi by way of the Hennepin Canal, and further that the proportion of three routes constructed by the Sanitary District of Chicago will exceed the cost of extending

the largest useful navigation by way of the Illinois River to the lower Mississippi, together with that of the Hennepin Canal to the upper Mississippi." (Laws of Ill., 1897, p. 309.)

n 1900 the trustees of the Sanitary District presented nemorial to the War Department. (House Document 56th Cong., 2nd Session, 1900, 1901, p. 4.) In that morial, referring to the Sanitary District Canal, the stees said:

"To-day a river deeper than the draft of any lake vessel, and wide enough to float, three abreast, its broadest beams, is flowing westward and spilling its waters into the Illinois basin, where they must *flow on wide, shallow and useless to commerce,* because no proper channel garners the waters which should be contributing to the nation's wealth by doing the nation's work." (Proceedings Board of Trustees of the Sanitary District of Chicago, 1900, p. 6839.)

he memorial called on the United States to perform condition contained in Section 24 of the Illinois Act 1889, upon which the right of the United States to trol the Sanitary District Canal for purposes of navion, was to arise. Its conclusion was as follows:

"That law makes Chicago turn over to the United States Government its entire investment aggregating already, as has been shown, $34,269,244.51, upon one condition, namely, *that it shall improve the DesPlaines and Illinois Rivers for navigation to connect with this channel.* It remains, therefore, for those who guide the destinies of our common country to say whether the general government shall qualify as the recipient of the greatest and most magnificent gift which a single municipality has ever sought to bestow upon a nation."

e think it sufficiently appears from the foregoing that portion of the DesPlaines which the bill claims is a ection between parts of a continuous waterway, not at its lower end connect with a navigable water

of the United States, and that that navigable water begins some fifty miles below its mouth.

We will now consider the situation at the upper end of that stretch.

b.

THE SANITARY DISTRICT CANAL IS NOT A WATERWAY OF THE UNITED STATES.

In the words of the former president of the Sanitary District of Chicago, Robert R. McCormick, in his official message, 1909, nine years after the waters were turned in:

> "At the present time the drainage canal as a navigable waterway extends nowhere. * * * Navigation on the drainage canal is practically *nil* owing to the fact that the drainage canal ends 'in the air' with no market at its inner end." (Report of President, 1909, pp. 14, 24.) The "inner end" there referred to is the DesPlaines River.

The United States had no part in the construction of the Sanitary District Canal; it exercises no jurisdiction over it, and by the terms of the Act of the Illinois Legislature under which it is constructed, it will exercise none unless and until the United States makes the DesPlaines and the upper Illinois navigable.

But the primary and principal purpose of the Act of Illinois for the creation of drainage districts, was to provide for the preservation of the public health by improving the facilities for the final disposition of sewage and by supplying pure water.

> "The fact that a navigable waterway may be created is a mere incident, and not one of the purposes for which a sanitary district is created."

The Supreme Court of Illinois so held in *Beidler* v. *Sanitary District*, 211 Ill., 629, 638.

It is, of course, true that Congress has, for admiralty rposes, juridiction over canals built for, and dedi-ed to, commerce, and actually used for purposes of mmerce. It was so held in *Ex parte Boyer,* 109 U. 629, concerning the Illinois and Michigan Canal, ich, as the court pointed out, was built with lands, or proceeds thereof, granted by the United States for t purpose, and subject to a condition prescribed in grant, that the canal "when completed, should be d forever remain a public highway, for the use of the vernment of the United States."

In *Malony* v. *City of Milwaukee,* 1 Fed., 611, it is said t

> "an artificial waterway or canal opened by a state to public use, for purposes of commerce, and while in fact used as a highway of commerce between the states of the Union, and between foreign countries and the United States, is 'navigable water of the United States' within the meaning of that term as used to define and limit the jurisdiction of the admiralty courts."

But such is not the situation presented here.

The mere digging of a channel large enough to accom-date boats used in commerce and filling that channel h sufficient water, does not create a navigable water-y of the United States. If nothing more happened builder might fill it up again without the consent anyone. Dedication to commerce, and the existence commerce, are necessary before the admiralty jurisdic-n of the United States can apply.

There is no evidence in this record of any navigation the Drainage Canal, and as we have seen, the Illinois preme Court has held navigation was not one of the rposes for which it was created.

It is true that it obtains its water supply from Lake

Michigan by virtue of a permit from the United States, but it cannot be successfully argued that the United States thereby acquired any control over the canal for navigation purposes, for the Act of the State Legislature under which the channel was created, and in aid of which the permit was granted, expressly declared when, and under what conditions, it should become subject to Federal control. Section 24 is as follows:

> "When such channel shall be completed, and the water turned therein, to the amount of three hundred thousand cubic feet of water per minute, the same is hereby declared a navigable stream, and *whenever the general government shall improve the DesPlaines and Illinois Rivers, for navigation, to connect with this channel*, said general government shall have full control over the same for navigation purposes, but not to interfere with its control for sanitary or drainage purposes."

But even if it be conceded, for the purpose of the argument, that the Sanitary District Canal is navigable water of the United States, yet the mere fact that the DesPlaines connects with it would not bring the latter within the jurisdiction of the United States. It must further appear that boats engaged in interstate commerce can pass from it into the Canal, or from the latter into it.

We have shown that the upper Illinois is not navigable. The same facts show that the DesPlaines is not, and we will add other evidence to that effect when we discuss that river. (*Post*, p. 96.)

It is submitted that under the authorities cited early in the discussion under this point, neither the Drainage Canal, the DesPlaines River, nor the Illinois above the point where it is practically navigable, is a waterway of the United States and subject to its jurisdiction under the Commerce clause of the Constitution.

Point X.

PELLEE IS SEEKING TO USE THE ACT OF MARCH 3, 1899, TO ACCOMPLISH AN INEQUITABLE AND UNJUST END. BEFORE THE ENTERPRISE WAS ENTERED UPON, THE WAR DEPARTMENT ASSURED APPELLANT'S PREDECESSOR THAT THE DESPLAINES RIVER WAS NOT A NAVIGABLE STREAM, AND THAT THE PROPOSED DAM WOULD NOT INTERFERE WITH, BUT WOULD AID IN, FUTURE IMPROVEMENTS OF THE RIVER, AND THE INVESTMENT OF APPELLANT WAS MADE UPON THAT ASSURANCE.

a.

EN HAD THE DESPLAINES BEEN NAVIGABLE, THE PURPOSE OF THE ACT WOULD HAVE BEEN EFFECTED BY THE PROCEEDINGS HAD BEFORE THE WAR DEPARTMENT.

In the light of the record in this case, the claim presented by the United States shrivels to the driest usk of technicality. Before any money was invested this enterprise, everything possible to be done to make certain that the dam, if constructed, would not obruct any future plans of the United States with refence to the river, was done. The War Department in bstance, gave its approval, and the only reason why did not formally approve the plans, was because it did ot consider the DesPlaines River a navigable water of ie United States. The Court of Appeals, in its opinion, akes no reference to this phase of the case, although was earnestly urged in the printed and oral arguments.

The facts we are about to narrate show that one Department of the United States Government is, in this roceeding, attempting to apply the Act of March 3, 899, not to effect the purpose for which it was passed, ut rather to accomplish an unjust and inequitable end, o the great injury of persons who, in good faith, acted pon a decision of another Department of that Govern-

ment. To make this clear will require a somewhat detailed statement of the facts leading up to the present situation.

The United States in this action, is endeavoring to destroy a large investment of appellant upon the claim that appellant was constructing a dam in a navigable water of the United States before the plans for the same had been submitted to and approved by, the Chief Engineer and the Secretary of War. Such submission and approval were all that was required, had the DesPlaines River been navigable. The consent of Congress is not necessary under the Act when the navigable portions of the river in question are wholly within the limits of a single state. In such case the authority of the Legislature of that state, and the approval of the plans by the Secretary of War are alone required.

The State of Illinois through its Supreme Court, has held in *State* v. *Economy Light & Power Company, supra,* that the stream was not navigable and that appellant, in building this dam, was doing what it had a lawful right to do. In *Canal Trustees* v. *Haven,* 5 Gil., 548, it was stipulated that the evidence showed that the DesPlaines was not a navigable stream. Manifestly then appellants' predecessor could not have been required, and in fact had no standing to ask, authority from the Legislature of Illinois.

b.

THE ONE, AND ONLY THING, THEREFORE, ON WHICH THIS ACTION OF THE UNITED STATES CAN BE RESTED, IS THE ABSENCE OF A FORMAL APPROVAL BY THE CHIEF OF ENGINEERS AND THE SECRETARY OF WAR.

Two facts are indisputable: One that the plans were not submitted for formal approval under the Act, be-

use the stream was, and for nearly a century had been, ld by the War Department to be unnavigable; the her, that if the river had, in the opinion of the De- rtment, been navigable, the plans would have been for- ally approved, as they were in fact informally ap- oved.

It is equally clear that Congress in passing the Act was t concerned about forms, but facts; the formal ap- oval was only an incident to the end to be accom- ished—protection of navigation.

In *Wilson, Attorney General,* v. *Hudson County Water* ., 76 N. J. Eq., 543; 76 Atl., 560, 565, the court, in eaking of the Act in question here, said that it was

> "a mere regulation for the benefit of commerce and navigation, and that the license or permission of the Secretary of War is only a finding and declaration of such officer that such proposed structure would not interfere with or be detrimental to navigation."

Substantially the same language was used in *Cobb* v. *ommissioners of Lincoln Park,* 202 Ill., 427.

Secretary of War Taft so construed the Act, in a hear- g concerning the dam in question in this suit.

c.

THE INSTANT CASE THE CHIEF OF ENGINEERS AND SECRE- TARY OF WAR FOUND NOT MERELY THAT THE PROPOSED STRUCTURE WOULD NOT INTERFERE WITH COMMERCE, WHICH WAS ALL THAT WAS REQUIRED UNDER THE ACT OF 1899; THEY FOUND THAT THERE WAS NO COMMERCE TO BE IN- TERFERED WITH, AND THAT THE DESPLAINES RIVER WAS NOT NAVIGABLE.

A decision that a proposed structure would not ob- ruct navigation, could not be put in more positive form an by declaring that the stream in question was not

navigable. In the instant case, however, the War Department went further, for it assured appellant's predecessors that the proposed dam was in harmony with tentative plans of the Government for making the stream navigable. And appellant made its investment, and began the construction of the dam on the faith of that assurance.

The persons interested in the project would have been justified in proceeding with the building of the dam without approaching the War Department, because that Department had made a record extending over nearly a century, that in its judgment the DesPlaines was an unnavigable stream. Elsewhere in this brief (pp. 118, 119, 125, 146) we have referred to the reports of surveys made by its engineers, which sustain this statement. Will it be contended that an owner, contemplating improvement of a stream classed as unnavigable by the War Department, must ask a permit from that Department under the provisions of the Act of March 3, 1899? Or that if he proceeds with his work, relying upon such classification, he is liable to be enjoined because he did not ask the Department to take jurisdiction over a stream which, according to its own repeated findings, was not within its jurisdiction?

But Mr. Munroe and Mr. Logan did not, as they might properly have done—Secretary Taft, as will be seen later, said they might—rely on the fact, always recognized by the War Department, that the stream was not navigable. They submitted their plans for the dam to that Department which alone had jurisdiction in the premises, and which having power to approve plans for obstructions in navigable streams, must, as an incident to the exercise of it, have had power to pass upon the question of navigability. The plans were presented to the Department in March, 1906. The purpose—as stated in a letter of Lt.

Col. Bixby, Engineer in Charge at Chicago, to Brig. Gen. Mackenzie, Chief of Engineers at Washington—was

> "to make evident that the proposed dam construction not only does not conflict with any existing U. S. law, but also will assist rather than injure the possible future navigation of the DesPlaines and Illinois Rivers, should the improvement of such rivers ever be authorized by Congress * * * and * * * to secure from the War Department some expression of opinion, informal or otherwise, so far as it can properly be given, *that will allow them to assure all inquirers that the War Department so understands the situation, and is making no objection to such prompt progress of the work as is necessary to a business enterprise of its magnitude and importance.*" (p. 2873.) (Italics ours.)

In the same letter Col. Bixby said:

> *"The DesPlaines River, so far as now known to this office, has never yet been considered a navigable stream of the United States. It is, therefore, apparently as yet subject to such jurisdiction as applies to all other unnavigable streams, and not subject to the provisions of Sections 9-13, Act of March 3, 1899, or to other similar U. S. legislation."* (p. 2872.) (Italics ours.)

In passing, we suggest that it would have been a most remarkable thing that the officer of the War Department in charge of the district through which the DesPlaines flows, and whose office was within a few miles of it, did not know that it was a navigable water of the United States, if in fact it was such.

Col. Bixby, in the same letter, advised Gen. Mackenzie that Mr. Munroe's proposition ought to be encouraged, and that he should receive from the War Department such expressions of favorable consideration as might be properly allowable under such circumstances. Referring to the report of a Board of United States Engineers of August 26, 1905, upon the feasibility and cost of a navigable waterway from Lockport, Illinois, *via* the Des-

Plaines, Illinois, and Mississippi Rivers, he quoted from it the statement that the plan submitted by that board was

> "not designed to develop water power, but there will probably be no difficulty in modifying it, so as to conform to such development if those who are to benefit thereby will co-operate with the Government. They should pay the cost of the dams, and the damage for flowage, which is no more than they would be compelled to do if the Government made no improvement." (p. 2873.)

Col. Bixby's letter then proceeded as follows:

> "The plans herewith submitted by Mr. Munroe show plainly a proposed co-operation such as that described in the above board report, offered in such manner as not only to pay the cost of this power dam, and to protect the United States against flowage damage, *but also to lessen by one the number of locks and dams necessary for future navigation and to otherwise save both time and money* ($142,385 in first cost, and $4,000 annually thereafter for maintenance and operation) to the United States, in case Congress should finally decide to undertake the improvement covered by the August 26, 1905, board report, *or to otherwise make this river navigable in this neighborhood.*" (pp. 2873-2874.) (Italics ours.)

He suggested that encouragement of the proposition be given with provisos for the contingency that

> "the river shall become a navigable water (*which it appears not to be at present*) and when the United States shall decide to give up the use of the canal and to assume the improvement of the river. Until such time I do not see how the War Department can assume any definite jurisdiction of the DesPlaines River, or make any definite demands upon any water power company already organized for the use of this river." (p. 2874.) (Italics ours.)

These provisos reappeared in the letter next to be referred to.

Under date June 7, 1905, Robert Shaw Oliver, Assistant Secretary of War, wrote to Mr. Munroe stating certain conditions, and concluding:

> "If these conditions are complied with, in the opinion of the Chief of Engineers, U. S. Army, concurred in by this department, the work proposed is in general harmony with the work of improvement recommended by the Board of Engineers appointed under authority of the River and Harbor Act of June 13, 1902 (32 Stat. L., 331, 364), in its report dated August 26, 1905, printed as House Document No. 263, 59th Congress, first session. Inasmuch, however, as Congress has not as yet authorized the improvement of this river, this department does not deem it expedient to take further and definite action in the matter of approving the plans." (pp. 2876-2877.)

The plans, it will be observed, were not submitted for approval, but only to get such assurance as the War Department gave. Not being a navigable stream, the Department had no jurisdiction over it. IT IS QUITE APPARENT, HOWEVER, FROM THIS CORRESPONDENCE THAT HAD IT BEEN NAVIGABLE, FORMAL APPROVAL WOULD HAVE BEEN GIVEN.

Therefore, even if it can be assumed that the river was in fact navigable, although the War Department was ignorant of the fact, the purpose of the Act as defined in the authorities, was effected. There was in the language of the court in *Wilson, Attorney General,* v. *Hudson County Water Co., supra,* "a finding and declaration of such officer that such proposed structure would not interfere with or be detrimental to navigation." As we shall show, having so found, the Secretary of War had no Constitutional power to refuse permission, even had he been so inclined.

But it is clear, not only that it was the judgment of the Department that the dam would not interfere with navigation, but that the Department did in fact, approve

its construction. The letter of the Assistant Secretary said:

> "It is understood that yourself and associates are willing to comply with the following conditions:" (p. 2875.)

And then followed three conditions, having to do with the construction, the protection of the United States from flowage damage, and the conveyance to the United States of a strip of land at least 150 feet wide across the north end of the dam, for a boat lock, if it so desired. How could that have been "understood," unless it was also understood that the United States approved of the building of the dam? So far as the work progressed these conditions were complied with, all the lands to be flowed were acquired by appellant, and while the remainder of the dam was built of concrete, 150 feet at the north end was built of soft earth, so that the Government, if it ever made the river navigable, might have the lock which was provided for. (pp. 2199-2200.)

But the War Department's connection with the matter did not end there. Thereafter, on December 15, 1906, the State of Illinois made an application to the Secretary of War to prevent him from granting a permit for the dam. As the result of it the Secretary of War, Mr. Taft, gave a decision which is an official record, in which, among other things, he said:

> "The truth is that the DesPlaines River, not being a navigable stream, no permit was necessary to put any obstruction in it which the War Department could prevent. But even if it had been a navigable stream, and even if the application had been made, and properly made to this Department to say whether this would interfere with navigation, if the Department concluded that it would not interfere with navigation, it is not within the power of the Department to withhold its expressing such an opinion and granting such a permit, so far as the United

States is concerned, for the purpose of aiding the state in controlling the water power. * * * All the United States does, assuming it to be a navigable stream, is merely to protect the navigation of the stream. * * * Therefore, what General Mackenzie has done out of the kindness of his heart does not commit this Department to any assertion of authority in the matter, and certainly does not carry us to the necessity of retracing our steps and saying that they shall not go on with this, when we had not any power to interfere at all." (pp. 1936-1938.)

At the hearing upon that application of the State of Illinois the following colloquy occurred between Secretary Taft and the then Chief of Engineers, General Mackenzie:

"Secretary Taft: It is not now navigable (referring to the Des Plaines River).

General Mackenzie: It is not now navigable.

* * * * *

Secretary Taft: But you are not seeking to exercise any authority over an existing navigable stream?

General Mackenzie: No, sir.

Secretary Taft: Or to grant a permit so as to protect interests of the United States in the stream?

General Mackenzie: No, sir.

Secretary Taft: *Suppose they were to go ahead without coming here at all. You would not go into court, or could not, by an order of this Department, prevent them from doing anything, could you?*

General Mackenzie: I do not think we could. Of course, under all the conditions, so far as they have gone, possibly we could call the attention of the Department of Justice to the matter, simply to have them consider it as a legal proposition.

Secretary Taft: Where would the Department of Justice get any power?

General Mackenzie: Only from the general law—that in case of violation of any law for the protection of navigable streams.

Secretary Taft: Yes, but the DesPlaines is not a navigable stream, is it?

General Mackenzie: It is not, to-day, sir.

Secretary Taft: And it could not become so ex-

cept by a declaration of Congress to carry work on it.

General Mackenzie: That is it, exactly.

Secretary Taft: Then where do I get any power to deal with it at all?

General Mackenzie: I do not know that there is any, Mr. Secretary." (pp. 3223-3224.)

The gravamen of the case against appellant is that a formal permit was not obtained from the Secretary of War to obstruct a navigable stream. In the above colloquy we have a declaration from that Secretary that appellant could have proceeded without going to the War Department at all, and that neither that Department, nor the Department of Justice, could have interfered because the stream was not navigable.

Relying upon assurances from the War Department appellant purchased the property and began the work. It executed a mortgage securing $3,000,000 of bonds of which $2,000,000 were sold (pp. 2199, 3182, 3185). Contracts were entered into by it for the construction of the dam, and the purchase of material, obligating it heavily, and at the time when construction was stopped by a preliminary injunction in the suit brought by the State of Illinois, nearly $200,000 had actually been paid on account of the work. (p. 3185.)

It was not until more than three years had elapsed that the Government of the United States indicated in any way that it no longer approved the prosecution of the work, which in the beginning it had encouraged, and the first notice of such disapproval was the bringing of the present action.

This Court is, therefore, dealing with a case in which a court of equity has exercised its extraordinary power to enjoin the erection of a structure in a stream on which there was no commerce to be obstructed, on the ground that no permit had been obtained from a Secretary of

ar who had asserted that no permit could be obtained cause the stream was not navigable and therefore was t within the control of Congress or the Federal Courts. We submit that upon this record, if instead of the vernment of the United States, a private individual corporation were seeking the relief which the trial urt granted and which the Court of Appeals affirmed, court of equity, upon the simple narration of this hisry, would say that the complainant's claim had no red of title to respect in such a court, and that it merd severe condemnation.

The Federal courts do not look with any more favor such an inequitable claim when put forward by the ited States than when it is made by an individual.

In *Chicago, Burlington & Quincy Railway* v. *Drainage mmissioners,* 200 U. S., 561, p. 593, this Court said:

> "If the means employed have no real, substantial relation to public objects which government may legally accomplish; if they are arbitrary and unreasonable, beyond the necessities of the case, the judiciary will disregard mere forms and interfere for the protection of rights injuriously affected by such illegal action. The authority of the courts to interfere in such cases is beyond all doubt."

In *Monongahela Bridge Company* v. *United States,* 6 U. S., 177, 195, this Court said:

> "Learned counsel for the defendant suggests some extreme cases, showing how reckless and arbitrary might be the action of executive officers proceeding under an Act of Congress, the enforcement of which affects the enjoyment or value of private property. It will be time enough to deal with such cases as and when they arise. Suffice it to say, that the courts have rarely, if ever, felt themselves so restrained by technical rules that they could not find some remedy, consistent with the law, for acts, whether done by government or by individual persons, that violated natural justice or were hostile to the funda-

mental principles devised for the protection of the essential rights of property."

We submit that the Government's attempt to avail itself of the Act of March 3, 1899, in this case, is wholly arbitrary and indefensible in law or morals.

d.

THIS COURT HAS INTIMATED THAT THE ACTS OF THE WAR DEPARTMENT, ABOVE NARRATED, SHOULD PREVENT INTERFERENCE WITH THE CONSTRUCTION OF THE DAM.

The judgment of the Supreme Court of Illinois in the State case was taken by writ of error to this Court. The writ was dismissed for lack of jurisdiction, but we think the opinion (*State of Illinois* v. *Economy Light etc. Co.*, 234 U. S., 497), shows that this Court had well defined views on the merits of the State case, which are equally pertinent to the merits of the present case. We refer in more detail to it elsewhere in this brief. Here we call this Court's attention to what it said as to the submission of the plans for the proposed structure and the action of the War Department with reference to the same.

The last two paragraphs of its opinion went directly to the question of the Federal right to enjoin the building of the dam irrespective of whether the State or the United States was the complainant. The court said:

> "It is said, however, that by the Acts of 1899, 1900 and 1902, Congress has taken jurisdiction of the DesPlaines River. If so, the State is not the instrument through which the jurisdiction can be exercised." (p. 524.)

If this Court meant to go no farther than to place its judgment upon the fact that if a Federal right existed, the State was not the proper party to enforce it, nothing more needed to be said. That was fully expressed. But it proceeded to show that no Federal right in fact existed.

t undertook to state what the situation would be, even the State could enforce an existing Federal right. The ext paragraph, referring to certain Acts of Congress or surveys of the Illinois and DesPlaines Rivers reads s follows:

> "But the cited acts are not appropriations for improvements undertaken but for improvements which may be undertaken; not a jurisdiction exercised but a jurisdiction to be exercised. And, as we have seen, it is alleged in the answer, and the allegation is sustained by the evidence, that the plans of defendant in error's structure were submitted to the War Department and it was declared by that Department, 'The work proposed is in general harmony with the work of improvement recommended by the Board of Engineers appointed under the authority of the Rivers and Harbors Act of June 13, 1902. (32 Stat., 331, 334, C. 1079.)' But the Department, inasmuch as Congress had not authorized the improvement of the river, did 'not deem it expedient to take further and definite action in the matter of approving the plans.' It is manifest, *therefore*, that the state has no right under Federal laws which it may assert for itself or '*on behalf of the citizens of all of the United States,*' and the motion to dismiss must be granted." (p. 524; italics ours.)

So that even if the State were the instrument through hich the jurisdiction could be exercised, yet for the eason stated in the last paragraph, there was no Federal ght to be exercised.

It is to be noted that the Court says "It is manifest *erefore.*" The word "therefore" relates back to the bmission of the plans and the declaration of the War epartment with regard to them. We submit that the eaning of this paragraph is that neither the State nor e general Government in the face of this record, is entled in a court of equity, to restrain that which the Govnment itself not only approved but encouraged.

e.

AS TO THE CLAIM THAT THE SUBMISSION OF THE PLANS TO THE WAR DEPARTMENT WAS A TRAP.

It was contended in the Court of Appeals, and may again be contended here, that Munroe submitted the plans to the War Department in order to trap the Government by securing by indirection, some committing statement by the engineer. It is unthinkable that if Munroe, and his associates, believed that the river was navigable they would have invested a huge sum of money upon a "committing statement" from a Government engineer, knowing that the fact was contrary to the statement, and that they might be ousted from the river at any time. What they would naturally have done would have been to ask for a permit to build the dam, and they could have asked it with almost absolute assurance that it would be granted, and they would then have had a clear legal title to maintain their dam, and a solid basis for the $2,000,000 of bonds which they floated, and for their further investment.

We say that it was practically certain that such a permit would have been granted because, under the conditions existing, including the fact that there was not, and had not been from earliest settlement of the country any navigation on the river, and that there were bridges on it in numerous places which made navigation impossible, there was no reason, within the meaning and spirit of the law, why the permit should not have been granted. Secretary of War Taft, in his opinion, as has been seen, definitely so stated.

If, therefore, a permit had been asked for, it could not have been refused. To have attempted to obtain a doubt-

"committing statement," when a permit was assured
sked for, would have been simply stupid.

n the Court of Appeals counsel for appellee claimed
t the Secretary of War was misled as to the
igability of the river by former Congressman Snapp,
o, they say, was in the employ of the Economy Light
Power Company.

He was not. He stated himself, at the hearing, that
was there representing the people of Joliet, in which
y he lived. He said to the Secretary of War that his
erest was to see to it that the development of power
the plans of Munroe and his associates, would not in-
fere in any way with the development of the water-
y, and that he compelled them by local pressure to
mit the matter to General Mackenzie, not for the pur-
se of asking for permission to do the work, but for the
rpose of satisfying himself, and his people, that the
rk contemplated would not, in the event that Congress
thorized the waterway, interfere with it in the least,
make it more expensive to the Government. (pp. 3222,
23.) As has been shown, the work, in the opinion of
e War Department would not only not so interfere,
t in the event of the improvement of the river for
vigation, it would have saved the Government a large
n of money. It was the Chief of Engineers himself
o told the Secretary of War that the river was not
vigable.

Point XI.

THE DESPLAINES RIVER IS NOT A NAVIGABLE STREAM.

a.

THE SUREST TEST OF WHETHER A STREAM, TRAVERSING A SETTLED COUNTRY, IS NAVIGABLE, IS WHETHER IT HAS BEEN USED FOR PURPOSES OF USEFUL COMMERCE. ACCORDING TO THIS TEST THE DESPLAINES RIVER IS NOT NAVIGABLE.

Elsewhere we refer to the evidence of non-user. It is sufficient here to repeat that the trial judge, in his opinion, said there was "no evidence of actual navigation within the memory of living man," and the Court of Appeals concurred in that finding, and that the Supreme Court of Illinois declared that there was not in the entire record a well authenticated instance in which a boat engaged in commerce, navigated the waters of the Des-Plaines River. The record in this case is the same in that particular as was that in the State case. In the days of early settlement before there were railroads or good highways, every stream susceptible of use was used. But no settler ever went to his destination on the Des-Plaines or upper Illinois, by water, no trader carried his merchandise, and no farmer his produce over them. The roads, or the soggy prairies, were used as far as La-Salle, and thence the Illinois River.

Former Governor Van Sant of Minnesota, who was a river boatman from 1857, and whose testimony on behalf of the State of Illinois in its case against appellant, was introduced in this case by the Government, testified on cross examination that it was a fact that in early days

"the effort was to build boats adapted to the small streams, so as to make them available for commerce, and *whenever there was a river that could be used, for commerce in some way or other, they built a boat to navigate it.* In those early days they resorted to the rivers as a matter of course, if the river could be used, and they built some kind of a boat, if one was possible, to navigate every stream where commerce can be carried on." (Abst., 2381.) (Italics ours.)

While in definitions of navigability it has been said that rivers

"are navigable in fact when they are used or are susceptible of being used, in their ordinary condition, as highways for commerce, over which trade and travel are or may be conducted in the customary modes of trade and travel on water," *Packer* v. *Bird*, 137 U. S., 661,"

yet it is said in Gould on Waters (Sec. 43):

"The extent to which a river * * * is used for navigation is the strongest evidence of its navigable capacity."

We think no case can be found where a river has been held navigable which, after settlement, has not been actually used for "useful commerce." The courts and text-book writers have many times declared such actual user to be the real test.

In Farnham on Waters (p. 121) it is said:

"The capacity as shown by the use to which it is put is the true criterion by which to judge the question of navigability."

And at p. 125 the author says:

"In a country which has long been settled the fact that a stream has never been used for navigation is strong evidence that in the opinion of the people who might use it, it is not of sufficient size to make such use valuable, so that the fact of use or no use may be of great weight in determining whether or not the stream is navigable."

In *State* v. *Gilmanton*, 14 N. H., 467, 480, the court said:

> "But there is another important consideration. It does not appear that the river was ever used by the public for the purpose of a highway. This is the surest test, and is the one relied on in the cases above referred to."

Burroughs v. *Whitwam*, 59 Mich., 226; 26 N. W., 491, the court, at p. 492, said of the stream under consideration in that case:

> "It has never been used at all for public purposes, except fishing, and there is no evidence that it can be used hereafter for any other purpose save pleasure. * * * Indeed, it was not seriously contended in the argument that it had ever been used for any public purpose as a highway; but stress was laid upon some testimony in the case of ex-Governor Begole and others, to the effect that, compared with other streams used for the purpose of floating logs, this seemed a first class stream, in the opinion of the witness; but facts are better than theories and disprove them. *In 50 years*, during which Genesee County has been converted from a wilderness into a garden, no one has ever yet thought of running a log or stick of timber down this creek to the City of Flint. *This is pretty nearly conclusive evidence that that stream has never been susceptible of public use* for *floatage, either valuable or otherwise.*" (Italics ours.)

Just so in the case at bar, pages were filled with expert and theoretical evidence in the endeavor to show that the DesPlaines is a navigable stream. But in *State* v. *Economy Light & Power Company*, 241 Ill., 290, 336, in language quoted by this Court (234 U. S., 520), it was said:

> "Whatever may be thought of the preponderance of it one way or the other, it can have but little weight as against the uncontroverted fact that the river has never been used as a public highway for commerce."

In *Webster* v. *Harris*, 59 L. R. A., 324, 330 (Tenn.), the court said:

"In determining the natural capacity of a body of water for navigable purposes, whether navigable in law or in the ordinary sense, the extent to which it is used for purposes of navigation should be looked to, *and this affords the strongest evidence as to its navigability or non-navigability in either sense.*" (Italics ours.)

b.

THE ILLINOIS AND MICHIGAN CANAL WAS BUILT PARALLELING THAT PORTION OF THE RIVER IN WHICH THE PROPOSED DAM WAS TO BE ERECTED, BECAUSE THE DESPLAINES WAS NOT NAVIGABLE.

Had the DesPlaines River been a navigable stream, the Illinois and Michigan Canal would not have been built. The expense was enormous for the times, justified only by the exigencies of the situation. No commerce passed between the navigable waters of the Illinois and Lake Michigan, except by wagon and stage. Governor Duncan in a message to the Illinois Assembly spoke of the proposed canal to connect "by a short and direct route, two great navigable waters," referring to Lake Michigan and the Illinois River. (p. 2821.)

In a similar message, dated December 2, 1834, Acting Governor Ewing spoke of the contemplated connection of Lake Michigan "with the navigable waters of the Illinois." (p. 2820.)

By the Act of Congress of March 30, 1822, the state was authorized to survey, and mark, through the public lands of the United States, the route of a canal connecting the Illinois River with the southern bend of Lake Michigan.

That was the only legislation of Congress in force when the Act of the Legislature of Illinois of February 14, 1823, was passed, providing for devising measures "to

effect the communication, by canal and locks, between the navigable waters of the Illinois River and Lake Michigan." In passing, we call attention to the fact that the Legislature, by this, its earliest, Act on the subject, recognized that there was not communication between Lake Michigan and the navigable waters of the Illinois, and that such communication if effected at all must be by canal and locks. Section 3 of the Act directed the commissioners thereby appointed to cause a survey to be made for

> "determining the most eligible and proper route for the same (the canal) and to cause all necessary surveys and levels to be taken. * * *"

The commissioners employed Justus Post and R. Paul as the engineers to make such survey. They began their examination in the autumn of 1823.

Post and Paul fixed the termini of the canal, one at the head of the Chicago River and the other a few miles below the rapids on the Illinois River near its confluence with the Little Vermilion, omitting all of the DesPlaines below Lockport, and the reason why they did so is indicated in the report of the commissioners as follows:

> "From the mouth of the Little Vermillion, above referred to, neither the Illinois nor the DesPlaines is navigable in low stages of water as they are frequently interrupted by rapids; but no serious obstacles present themselves in effecting a canal navigation from the head of the navigable waters of the Illinois River to Lake Michigan." (p. 1136.)

Up to time of the building of the canal, no boat had been devised which did, or could, use the DesPlaines River for the purposes of commercial navigation, as that term has been defined in the decisions of this Court.

The record shows that many persons survived at the time of the hearing of the State case, in 1908, who were living in 1848—the year when the canal was opened for

navigation—and old enough at that time to have known of, and to have had fixed in their memories, the existence of navigation had there been any. Many witnesses were called who knew the river before the opening of the canal; of these several were above the age of twelve years when the canal was opened, and one was then thirty-three years of age. No one of these witnesses had ever seen, known, or heard of merchandise or passengers having been taken up, or down, the DesPlaines River, or had ever seen anything larger than a hunter's boat upon its waters. In direct conflict with this uncontradicted testimony, the Court of Appeals in its opinion, said that

> "After the year 1848, when the Illinois and Michigan Canal was constructed, commerce that had formerly been carried on the DesPlaines River was carried on the canal."

To show that this statement is not only unfounded, but is in direct conflict with all the evidence on the subject, we refer to that evidence in another portion of this argument. (p. 131.)

Each of the witnesses who knew the river before 1848 testified that they, and their neighbors went by road to, and from, Chicago, and that their farm products were taken by ox teams or horses, and that they met wagons from points as far as Bloomington going to and from Chicago. One of these witnesses testified that he had occasion to go to St. Louis to buy goods for his store, that he brought them to Ottawa by boat and from Ottawa to Lockport by wagon. (pp. 2506-2507.) There was a regular stage line running from Chicago to Peru, through Joliet and Lockport, as early as 1836, and a through route for the carriage of merchandise was also then advertised. (pp. 2524, 3126.)

Upon the fact alone, established by these witnesses, that all the produce of the DesPlaines Valley, and of the

Illinois above Ottawa, was carried on over wagon roa
in a primitive time, when every stream that was capa
of bearing up boats adapted to commercial purposes, w
naturally resorted to, we would be willing to rest our co
tention that the DesPlaines was not, in its natural con
tion, navigable. That the State took upon itself the bu
den and expense of the building of a canal paralleling
and did so, as it stated in its memorial to Congress,
order to "form an important addition to the great co
necting links in the chain of internal navigation" wou
seem to leave no room for doubt in the minds of reaso
ing men that such a link did not exist prior to its co
struction.

c.

THE NAVIGABILITY OF THE DESPLAINES IS NOT TO BE DET
MINED BY ITS CAPACITY AS CHANGED BY THE ADDITION
WATERS THROUGH THE SANITARY DISTRICT CANAL.

As Point I, *supra*, we have stated the rule that the te
of navigability is whether in its natural condition
affords a channel for useful commerce. One of t
most recent enunciations of this doctrine is found in t
important case of *United States* v. *Cress*, 243 U. S., 31
where the court said:

> "It follows from what we have said that the ser
> tude of privately owned lands forming the banks a
> bed of a stream, to the interests of navigation, is
> natural servitude, confined to such streams as in the
> ordinary and natural condition are navigable in fa
> and confined to the natural condition of the stream

In *The Montello*, 20 Wall., 430, 443, the court said:

> "The vital and essential point is whether the na
> ural navigation of the river is such that it affords
> channel for useful commerce."

It is not the fact that every stream which, in the ear

day when there was no other means of transportation, was capable of being used at certain seasons of the year, by craft which could be carried over numerous portages is a navigable water of the United States. Such a stream was the DesPlaines River.

In the *Montello* case, 20 Wall., 430, 442, the court said:

> "It is not, however, as Chief Justice Shaw said, 'every small creek in which a fishing skiff or gunning canoe can be made to float at high water, which is deemed navigable, but in order to give it the character of a navigable stream, it must be generally and commonly useful to some purpose of trade or agriculture.'"

And in *Donnelly* v. *United States*, 228 U. S., 708, 709, the Supreme Court held that evidence which

> "showed an apparently irregular traffic, in times of high water only, employing Indian canoes, 'dugouts,' and at certain times small steamboats and gasoline launches,"

did not establish navigability of the stream there in question.

So, in *Hubbard* v. *Bell*, 54 Ill., 110, the court held that navigable waters must be capable of practical general uses.

In *Schulte* v. *Warren*, 218 Ill., 108, 119, it was held that

> "a stream is navigable in fact only where it affords a channel for useful commerce and of practical utility to the public as such. The fact that there is water enough in places for rowboats or small launches answering practically the same purpose, * * * does not render the waters navigable."

In *Mayor, etc.*, v. *Harlow* (Md.), 98 Atl., 852-857, the court said:

> "A theoretical or potential navigability or one that is temporary or precarious, and unprofitable, is not sufficient."

It is alleged in the bill of complaint that because since

the opening of the Sanitary District Channel, a large amount of water has been diverted from Lake Michigan to the DesPlaines River, the Sanitary District Canal is a part of the navigable waters of the United States, and that the DesPlaines itself below the point at which it connects with that canal "has been continuously" part of the navigable waters of the United States. Substantially all of the opinion evidence introduced by the United States concerned the river in its condition as altered by the inflow of water through this Canal.

The trial court in its opinion said:

> "Also claim of right to injunction because river is now navigable within meaning of *Montello* doctrine, untenable, because present volume of water due to artificial cause."

This language must be construed to refer to a *claim* that the river is now navigable and not as expressing an opinion that it *is* so. As we show elsewhere there is not a particle of evidence that the river is now navigable for any purpose.

But even if the river as changed by artificial means had in fact become navigable, the rights of owners would not be affected thereby.

It is unnecessary for us here to present all the considerations which establish the fact that the navigability of the river cannot be determined by its condition as created by artificial means. That question was fully considered by the Supreme Court of Illinois, in *Illinois* v. *Economy Light & Power Co., supra.* That Court said:

> "Appellant strongly contends that the rights of appellee as riparian owner are to be determined with reference to the conditions that exist since the deepening of the Illinois and Michigan Canal and the construction of the Sanitary District Channel, by means of which the volume of water in the DesPlaines River has been greatly increased. It is argued that the

navigability of the river is to be determined with reference to the changed condition and not as the stream existed in a state of nature. Appellant's position, as we understand it, is this: Assuming the stream to be unnavigable in its natural condition, the State may by artificial means so change the stream as to make it navigable and thus destroy the vested property rights of riparian owners upon the said stream. The position is untenable. The property rights of riparian owners in the bed of an unnavigable stream are as sacred as any other property right, and such owners cannot be deprived of those rights without compensation, by artificial additions to the waters of the stream whereby it is rendered navigable. To hold that the State can by artificial means make a stream navigable which in a state of nature was not navigable, and thereby deprive riparian owners of their property rights in the bed of the stream, is simply to hold that private property may be taken or damaged for public use without compensation." (p. 324.)

This Court in its opinion on the writ of error in that case analyzed at considerable length, this finding of the Supreme Court of the State, and it is evident that its views were in harmony with those of the State court. (234 U. S., 520-523.) Among other things this Court said:

"The Court seemed to consider that it had decided all the contentions of the state when it had decided the question of the navigability of the river both in its natural condition and its condition after the addition of the waters of the Sanitary District. The fact was and is pivotal." (p. 253.)

In *Philadelphia* v. *Stimson*, 223 U. S., 605, which related to the powers of the Government to exercise control over navigable waters under the Act of 1899, the court held that the owners' rights are not affected "when the change in the stream is sudden, or violent, and visible," but only when it is "gradual and imperceptible."

The same doctrine is held in *Schulte* v. *Warren,* 218 Ill., 108.

In the instant case the increase in the volume of the DesPlaines River was "sudden, violent and visible." It was caused by the raising of a gate of the Bear Trap Dam at the end of the Drainage Canal at Lockport, and by the shutting of that gate the stream can be at any time reduced to its original volume. Indeed, the volume is continually regulated by the operation of the gate.

In *United States* v. *Cress, supra,* this Court said:

> "In Kentucky, and in other states that have rejected the common law test of tidal flow and adopted the test of navigability in fact, while recognizing private ownership of the beds of navigable streams, numerous cases have arisen where it has been necessary to draw the line between public and private right in waters alleged to be navigable; and by an unbroken current of authorities it has become well established that the test of navigability in fact is to be applied to the stream in its natural condition, not as artificially raised by dams or similar structures; that the public right is to be measured by the capacity of the stream for valuable public use in its natural condition; that riparian owners have a right to the enjoyment of the natural flow without burden or hindrance imposed by artificial means, and no public easement beyond the natural one can arise without grant or dedication save by condemnation with appropriate compensation for the private right." (p. 321.)

In *Thunder Bay River Boom Company* v. *Speechly,* 31 Mich., 336, the court, by Cooley, J., combated vigorously the idea that private rights could be destroyed by thus altering the condition of a stream, saying:

> "The doctrine that this may be done without compensation to parties injured is at war with all our ideas of property and of constitutional rights. * * * As was remarked in *Morgan* v. *King,* 35 N. Y., 460, the question of public right in a case like this is to

be decided without reference to the effect which artificial improvements have had in the navigable capacity of the river; in other words, the public right is measured by the capacity of the stream for valuable public use in its natural condition; and any attempt to create capacity at other times at the expense of private interests can be justified only on an assessment and payment of compensation."

In *Druley* v. *Adam*, 102 Ill., 177, where the right of a riparian owner to the use of the water added to the Des Plaines by the Illinois & Michigan Canal was in question, the same doctrine was applied.

Other leading cases which hold that a State cannot by artificial means make a stream navigable which in a state of nature was not so, and thereby deprive riparian owners of their property rights in the bed of the stream, are

Tourtelotte v. *Phelps*, 4 Gray, 370.

Lovingston v. *St. Clair County*, 64 Ill., 56.

City of Chicago v. *Laflin*, 49 Ill., 172.

In the latter case the Supreme Court of Illinois said:

"It would be monstrous that the city should, at pleasure, make changes in this stream so as to render buildings on the wharves an obstruction and then require their removal without compensation. Such power would be more vast and absolute than can be exercised by the State itself."

d.

THE ATTEMPTED USE OF THE RIVER IN PRE-SETTLEMENT DAYS BY EXPLORERS AND TRADERS PROVED THAT IT WAS UNNAVIGABLE. THE RECORD IN THE STATE CASE WAS SUBSTANTIALLY THE SAME AS IN THE INSTANT CASE. SUCH ADDITIONAL USE AS WAS SHOWN IN THIS CASE TENDED TO SUPPORT THE CONCLUSION THAT THE RIVER WAS NON-NAVIGABLE IN THE EARLIEST HISTORICAL TIMES.

In *Wear* v. *Kansas*, 245 U. S., 154, this Court, referring to the decision of the State court that the Kansas river was navigable, said:

> "The fact is of a kind that should be established once for all, not perpetually retried."

In the instant case, the trial judge declined to give any weight whatever to the finding of the Illinois Supreme Court, that the DesPlaines was not a navigable stream. In his opinion he said:

> "Judgment of State Supreme Court against navigability in Illinois vs. present defendant, obviously rendered on record vitally differing in facts from the record here, as to actual use of stream for fur trade and travel by customary mode at time of use. Therefore, that judgment not persuasive, it appearing from court's opinion to have been based on the absence of evidence from that record as to such use, which evidence is present here."

It cannot be understood how the trial judge came to this conclusion unless it be that because more than three and a half years had elapsed from the time he took the case under advisement and the time when he decided it, his memory was not clear as to the state of the record.

The fact is that what the trial court referred to as additional instances of "actual use," were almost all records of efforts to use the river which resulted in failure.

The Court of Appeals said:

> "The difference in the records in the two cases would not, perhaps, warrant a different conclusion, although the evidence here is somewhat stronger in favor of navigability than in that case." (p. 804.)

The reason why the Court of Appeals came to a different conclusion from that arrived at by the Supreme Court of Illinois is very evident. The latter court rejected the "floatage" definition of navigable waterways of the United States and the Court of Appeals accepted it. The Court of Appeals frankly admitted that it took "a different view as to the force and effect of the historical accounts of the early use of the river."

Some eighty witnesses were examined in the State case whose testimony was read, and became part of the record, in the instant case. But eighteen witnesses testified in this case who did not testify in the former, nearly all of whom were engineers, experts or historians who were put on the stand to draw conclusions from the historical evidence, which it was the business of the court to draw. We will deal with the testimony of such witnesses briefly later. Our present purpose is to show that the experience of explorers and traders in pre-settlement times proved that the river was not navigable even for their frail craft, and that the trial judge was wholly mistaken when he said that the record in the State case differed vitally from the record in the instant case *"as to actual use of the stream for fur trade and travel,"* and the Court of Appeals was also in error in saying that the evidence in the instant case was somewhat stronger.

The abstract of the record in the State case contained over three thousand printed pages. A reference to the opinion (241 Ill., 290), will convince the Court, we think, that the Supreme Court of Illinois gave very careful consideration to that record and to a study of the early use of the river.

OUR TASK IN THIS PARTICULAR WILL BE TO REFER TO ALL SUCH EVIDENCE OF ACTUAL USE AS APPEARS IN THE RECORD IN THE INSTANT CASE WHICH WAS NOT CONTAINED IN THE RECORD IN THE STATE'S CASE. It very strongly corroborates LaSalle's characterization of the river as written by him in 1682:

> "in the summer there is no water at all in the Des Plaines and Illinois as far down as Fort St. Louis (Starved Rock), where the navigation of the Illinois River begins at this season. (p. 295.) * * * Navigation would be only for a short time, at most for fifteen or twenty days each year, after which there is no longer any water. * * * the waters are always drained in the month of March, so that it would be easier to transport the goods from Ft. St. Louis to the Lake by land by making use of horses, which it is easy to have, there being numbers among the savages." (p. 35.)

These additional instances are as follows:

Tonti, LaSalle's lieutenant, in November or December, 1680, undertook a trip from Starved Rock to Lake Michigan in a canoe. (pp. 30, 31.) Somewhere on the trip the canoe was abandoned, just where does not appear. Parkman, the historian, puts this on the DesPlaines River. How much of the trip was made overland is not shown, but the accounts of Joutel (pp. 43, 45, 214, 1533, 1740-44, 1922, 1923), a companion of LaSalle, Charlevoix (pp. 58, 59, 1187, 1189, 1407, 1408), Hubbard (pp. 119-123, 219-222, 303, 1198, 1199, 1509-1515), Schoolcraft (pp. 233-237, 1191-1193, 1462, 1568), Graham & Phillips (p. 1403), LaSalle (p. 295), St. Cosme (pp. 49, 50, 1567, 1360), and others, indicate that ordinarily it was necessary to carry the canoe a large portion, if not all, the way from the mouth of the DesPlaines to Chicago.

In 1682 Tonti came in a canoe to Starved Rock and was compelled to abandon it, and walked on land to Lake Michigan, forty leagues from there. (Abst., 1737-1738.)

In 1687 Joutel and his party made a land passage of 40 leagues from the Illinois River to Chicago *en route* to Mackinac, because there was no water in the river. Arrived at Chicago, they embarked in canoes of three men who had arrived from Mackinac on their way to Starved Rock and who had left their canoes and goods at Chicago, because there was no water in the river. Joutel's party failed in their attempted journey, turned back, left the canoes at Chicago and returned to Starved Rock on foot. (Abst., 1741-1743.)

In March, 1688, Joutel again came from the same point to Chicago. This was the time of spring flood and the canoes were pulled with great difficulty, the men walking in the water much of the way, and dragging their canoe. (Abst., 43-45, 1533-1534.)

Charlevoix, in 1721, planned to use the Chicago- DesPlaines route, but "being informed that at this season of the year there is not water sufficient for a canoe" he took the route by the St. Joseph and Kankakee involving a journey greater by some 200 miles than that from Chicago direct to the Illinois. (Abst., 58.)

Kennedy in 1773 tried to ascend to the head waters of the Illinois in a boat of three feet draft. He and his party were compelled to leave it some 60 miles below the mouth of the DesPlaines because the water was so low that they could get no farther with their boat, and they proceeded by land. (Abst., 241-242, 1172.)

Hennepin, who accompanied LaSalle in 1679 and 1680, wrote that the "desPlaines River is not navigable for 40 leagues except for canoes which have hardly enough water in the summer time." (Abst., 38-39.)

LaHontan, in April, 1689, reported that having arrived at the village of the Illini, to lessen the drudgery of a great land carriage of 12 leagues, he engaged 400 men

to transport his baggage from the Illinois River to Lake Michigan, which was done in four days. (Abst., 218-219.)

One Tanner, in 1819, journeyed from St. Louis to Chicago. Part of the way he used a Mackinac boat; but his narrative says:

> "The current of the Mississippi below Missouri soon convinced me that my large and heavy boat was not well adapted to the nature of my undertaking, and at portage DeSioux I left it. From this place I proceeded in a small canoe with two men, to the head of the Illinois river, thence to Chicago." (Abst., 3253-3254.)

Tanner made a return trip in 1820, and his necessary portage was 120 miles from Chicago to the Illinois River. Arrived at Chicago he found a Frenchman who had just carried boats by wagon across the portage. Tanner says:

> "Though his horses were now much worn out from the long journey from which he had returned, he agreed to take me and my canoe sixty miles, and if his horses could hold out, the whole one hundred and twenty, which was, at the present stage of the water, the length of the portage." (Abst., 3255.)

At the end of sixty miles the horses gave out and Tanner attempted to put the canoe in the water, not to ride in it, but to drag it, but after three miles he found this method so slow and laborious that he engaged an Indian to take his baggage and his children on horses sixty miles farther. (Abst., 3255-3256.)

In 1822 he returned up the Illinois, but at about Peoria he left his canoe and took a horse to Chicago. (Abst., 3256a.)

Childs made a trip from St. Louis to Lake Michigan in 1821 in a canoe paddled by two men. It was in the spring of the year, at a time of great rains, when the streams overflowed their banks and the country was flooded. The flood was so extensive that he did not know when he had reached the portage, so he left the Des-

Plaines and traveled in his canoe across country until he found the current of the Chicago River. (Abst., 1166, 697.)

Schoolcraft in 1821 came up the Illinois in a canoe as far as Starved Rock. The difficulties of navigation were such that his party relinquished the design of proceeding any farther by water, but made their journey to Chicago on horses. He referred in his narrative of his trip, to the "error of those who have supposed that a canal of only eight or ten miles would be necessary to provide navigation between Lake Michigan and the Illinois" (p. 236), stating that in their journey to Chicago they had seen the channel in the river at a sufficient number of places to determine that it has several long and formidable rapids which completely intercept navigation at this sultry season; "a remark that has been confirmed by meeting several traders on the plains who had transported their goods and boats in carts from Chicago Creek, and who informed us they thought it practicable to enter the Illinois at Mt. Joliet. This would lengthen the portage to about 30 miles, but it has been perceived that we experienced difficulties far below this last mentioned point." (Abst., 235.)

Tousey in 1823 went through that country on horseback, and he wrote:

> "For many years I have felt a most anxious desire to see the country between Chicago and the Illinois (river), where it has generally been, ignorantly, supposed that only a small sum would be wanting to open a communication between them. By traveling on horseback through the country and down the Illinois, I have conceived a different and more exalted opinion of this communication, and of the country than I had before, while I am convinced that it will be attended with a much greater expense to open it than I had supposed." (Abst., 1190.)

In 1823 a Lieut. Hobson told William H. Keating th
he had traveled the DesPlaines River with ease in a b
loaded with lead and flour. (Abst., 135-136)

In 1825 or 1827—the date is uncertain—one Fon
came up from the Illinois in a canoe, and he merely stat
that

> "We paddled along until we came to the D
> Plaines river, from which we passed into a lar
> slough or lake that must have led us into a bran
> of the Chicago river, for we followed a stream th
> brought up opposite Ft. Dearborn." (Abst., 1
> 137.)

Furman in the spring of 1829—the period of freshets
paddled a canoe down the river. (Abst., 148-149.)

In his description of his trip he says that "during t
spring floods a considerable lake is formed."

There is a record that one Galloway journeyed wi
his family and possessions in a dugout made from a bla
walnut tree from Chicago to a home established by hi
somewhere on the Illinois. The story as told in 1880 b
his daughter says that he took advantage of the usu
spring freshets. (Abst., 1702.)

WITH THE EXCEPTION OF THE USE, OR ATTEMPTED USE,
THE RIVER BY THE AMERICAN FUR TRADE COMPANY, TH
ABOVE CONSTITUTE ALL THE FACTS "AS TO ACTUAL USE
STREAM FOR FUR TRADE AND TRAVEL BY CUSTOMARY MODE
TIME OF USE" WHICH WERE NOT IN EVIDENCE IN THE STA
CASE AND REVIEWED BY THE SUPREME COURT OF THE STAT
IT WILL BE NOTED THAT IN NONE OF THESE INSTANCES, E
CEPT THE STATEMENT OF HOBSON, DOES IT APPEAR THAT T
PERSONS WERE CARRYING MERCHANDISE OF ANY SORT, A
THAT THEY WERE TRIPS IN CANOES, EXCEPT THAT ONE WAS
A DUGOUT.

It will be further noticed that there is but one instanc
as disclosed by this additional evidence, where any u
whatever was made of the river before the passage

the Ordinance and the early Acts of Congress. That was in 1688, when Joutel's men dragged their canoe through the river at time of flood. In this one narrative is found the only basis for the trial judge's conclusion that the decision of the Supreme Court of Illinois was not even persuasive, because "obviously rendered on a record differing in facts from record here as to actual use of stream for trade and travel by customary mode at time of use."

In the above discussion of the actual attempts to use the river shown in the record, we have deferred the accounts left by Gurdon S. Hubbard. Hubbard was connected with the American Fur Company, and that company endeavored to make practical use of the DesPlaines River in the fur trade, some years after the latest of the early legislation on which the trial court relied. No other reference in this voluminous record tends to show any attempt to make any regular use of it as a mode of trade or travel. All of the other material upon which this case is attempted to be built up, relates to instances of individuals endeavoring by canoes or other small boats, usually unsuccessfully, and at long intervals, to make some use of the river.

Hubbard first came to Chicago September 30, 1818, in the employ of the American Fur Company. His narrative shows that for about six years, from 1818 to 1824, some use was made of the DesPlaines River by the traders of that company. The descriptions which Hubbard gives of those trips serve but to confirm all the other evidence going to show that the possible use of the river was "temporary, precarious and unprofitable." Such use, as is said in *Harrison* v. *Fite*, 148 Fed., 781 (C. C. A., 8th Circuit), is not sufficient to show navigability.

Hubbard's narrative discloses that during the time he was engaged as a subordinate employee, he urged upon

the superintendent of the American Fur Company th abandoning of the attempt to use the DesPlaines Rive at all, and that when he himself became superintendent i 1822, he did abandon it altogether, in order to avoid "th long, tedious and difficult passage through Mud Lak into and upon the DesPlaines." One round trip wa made each year, the down trip being in the high wate of the fall, and the return trip in the high water o the spring. Once Hubbard took the long route aroun by the St. Joseph River to the Kankakee River to reac the posts on the Illinois, one reason he gives being t avoid "the delays and hardships of the old route throug Mud Lake and the DesPlaines." (p. 223.) In places o the DesPlaines the boats were unloaded and the good carried on the backs of the men over shallow places, an the boats passed over by means of rollers under them until the Illinois River was reached. (pp. 120, 123.) A times the water in the river was so low that it could b crossed on foot without wetting the skin of the feet. (221.)

Hubbard says that the superintendent, Deschamps having resigned, he was appointed to succeed him; an proceeds:

> "I now determined to carry out a project whic I had long urged upon Mr. Deschamps, but withou success: that of unloading the boats upon their ar rival at Chicago from Mackinaw and scuttling them in the slough to prevent their loss by prairie fire until they were needed to reload with furs for th return voyage. The goods and furs I proposed t transport to and from the Indian hunting ground on pack horses. *In this manner the long, tediou and difficult passage through Mud Lake into an down the DesPlaines River would be avoided, an the goods taken directly to the Indians at their hun ing grounds, instead of having to be carried in pack on the backs of men.*" (Abst., 221.)

It is interesting to note that the first white man engaged in trade in this territory, and the last man who ever attempted to use the DesPlaines for any purposes of trade, came to precisely the same conclusion. For LaSalle, writing in 1682, said:

> "The Chicago (DesPlaines) River is not even navigable for canoes, except after this flood. The waters are always drained in the month of March, so that it will be easier to transport the goods by land from Port St. Louis to the Lake, making use of horses, which it is easy to procure there." (Abst., 35.)

He further said that that river "does not have any water most of the year." (Abst., 36.)

e.

THE OFFICIAL RECORDS SHOW THAT THE DESPLAINES RIVER HAS ALWAYS BEEN CLASSED BY THE UNITED STATES AS NON-NAVIGABLE.

The opinion expressed by the War Department when the plans of the dam in question here were submitted to it, that the DesPlaines was not navigable, was in accord with the attitude of the Government toward that stream from the time of the earliest settlement, as is shown by the official records.

Graham & Phillips, in a report of the Department of War dated December 28, 1819, to the House of Representatives upon the practicability of uniting by a canal the waters of the river and the waters of Lake Michigan, among other things said:

> "On opening the canal, however, two difficulties would be experienced:
>
> 1st. The Plein (DesPlaines) would be found to be above the level of the canal; its water, of course, would be diverted from its natural channel, and pass by the canal into the lake.
>
> 2nd. *Supposing that evil remedied by a lock to*

> *lift vessels into the Plein, yet the Plein, during half of the year, does not contain water enough to float a boat,* AND SO COULD NOT BECOME USEFUL AS A NATIONAL HIGHWAY." (Abst., 115.)

In the same report, commenting upon the varying length of the portage at different seasons of the year, Graham & Phillips said that at one season

> "there was a portage of fifty miles, from the mouth of the Plein to the lake; over which there is a well beaten wagon road, and boats and their loads are hauled by oxen and vehicles kept for that purpose by the French settlers at the Chicago." (Abst., 116.)

This accords with the narrative of Tanner, *supra.*

Gen. James H. Wilson, in a report to the Secretary of War dated December 17, 1867, upon a survey to prepare plans and estimates for a system of navigation by way of the Illinois River between the Mississippi and Lake Michigan, speaking of the DesPlaines, said:

> "The river itself, except in floods, is very shallow, being often reduced in dry seasons to a mere brook, discharging less than 1,000 subic feet of water per minute." (Abst., 161.)

He further stated that

> "The DesPlaines in low water contributes a compartively inconsequent quantity to its volume (the volume of the Illinois). The Kankakee supplies water sufficient to make a good slack-water navigation. The DesPlaines of itself, does not." (Abst., 2844.)

General Wilson made a report dated February 15, 1867, on a survey of the Illinois River, which report, among other things, said:

> "The practical conclusion from the foregoing statement is that a method of improvement by feeding from Lake Michigan as a reservoir, is feasible between LaSalle and Grafton, but above that point it will be necessary to employ locks and dams, and small sections of canal at Lockport and Joliet and Marseilles Rapids." (Abst., 2396.)

Major Benyaurd, in a report dated September 2, 1882, ncerning a waterway between Joliet and LaSalle, said:

> "It is evident, after consideration, that the only feasible plan to render the stream navigable is to slackwater the whole distance." (Abst., 655.)

A significant feature of this report was the recogni- on by the engineers that, because the stream was not, its natural condition, navigable, the Government ould have to pay for lands affected by any such im- rovement to make it navigable. They said:

> "Certain lowlands will necessarily be submerged, * * * very little of it, however, is of any considerable value, and can very easily be estimated for * * *." (Abst., 655.)

The same suggestion occurs in the Ernst report of 905, shortly to be mentioned.

In the Barlow report to the War Department dated ovember 18, 1900, of a survey for the improvement of ie upper Illinois River and lower DesPlaines River, with a view to the extension of navigation from the Illi- ois River to Lake Michigan," appears the following:

> "While the upper Illinois and Des Plaines Rivers *are at present nonnavigable*, the commerce of the Illinois and Michigan Canal which has been constructed in the valleys of these rivers, may be taken to represent the present commerce of such a route." (Abst., 2855.)

The Barlow report recommended that the bed of the llinois River be improved and used from Marseilles to ie mouth of the Kankakee, "thence by enlarging the Illi- ois and Michigan Canal to the Joliet basin, 18.3 miles." Abst., 2855-2856.) This cut out entirely the portion of ie DesPlaines River in which appellants' dam was to be ected.

The Ernst Board of United States Engineers in 1905 ecommended an improvement of the DesPlaines and

upper Illinois by locks and dams, with canals, however, from Dam No. 1 at Joliet to the head of Lake Joliet, and a canal at Marseilles. In that report the rights of the owners—and especially of water power owners—to be compensated, were expressly recognized. Under the heading "Vested Rights" reference was made to the value of water power rights, and the report said:

> "The plan submitted is not designed to develop water power, but there will probably be no difficulty in modifying it so as to conform to such development, *if those who are to benefit thereby, will cooperate with the Government.* They should pay the cost of the dams and the damage from flowage, which is no more than they would be compelled to do if the Government made no improvement." (Abst., 2857.) (Italics ours.)

This clearly indicates,—as indeed, does the whole report,—that the DesPlaines was not navigable, for if navigable, the Government was not under obligation to consider that the property owners had a vested right to maintain dams obstructing commerce, without the consent of Congress.

f.

THE REPORT OF THE ENGINEERS EMPLOYED BY THE STATE OF ILLINOIS IN CONNECTION WITH THE LAYING OUT OF THE ILLINOIS AND MICHIGAN CANAL, SHOW THAT THE DESPLAINES WAS NOT ONLY NOT NAVIGABLE, BUT COULD NOT FURNISH SUFFICIENT WATER TO SUPPLY A NAVIGABLE CANAL.

The earliest report of the Canal Commissioners was dated January 3, 1825, and it stated that neither the Illinois, above the mouth of the Little Vermilion, nor the DesPlaines, was navigable in low stages of water. (Abst., 2824.)

It is noteworthy that this declaration, was made nearly

a century ago, and had reference to navigation as then carried on, and was but three years after the last attempt of the American Fur Company to use the Des-Plaines at times of flood in spring and fall. At that time, as the report shows, the navigable waters of the Illinois River and Lake Michigan were "remote from the inhabited parts of this state." (p. 2823.)

Mr. Bucklin, an engineer employed by the canal commissioners, in a report dated January 21, 1833, said:

> "The River DesPlaines when low, affords a very inconsiderable quantity of water." (p. 2830.)

In another report, after stating that the Calimic (Calumet) could safely be relied upon as furnishing 320,000 cubic feet per hour as its minimum discharge, and that an additional supply of 102,400 cubic feet per hour would be required for the canal, said:

> "It has been also proposed to effect a water communication between the lake and the Illinois River by means of dams and locks in the DesPlaines, forming a still water navigation. Knowing the minimum discharge of this river, the impracticability of this scheme is so evident that the subject is here noticed more as a matter of form, than with any expectation of rendering it clearer. It will be recollected that the quantity of water provided for the passage of 96 boats over the summit level every 24 hours in the canal, is 86,400 cubic feet per hour. * * * *The minimum discharge of the River DesPlaines is only* 60,000 *cubic feet per hour. Of course, it is not competent to supply even the lockage* * * * *without taking into consideration the loss by evaporation and leakage, which would alone consume at least* seven times the quantity of water discharged by the River DesPlaines at its lowest stage." (pp. 2831-2832.)

In 1837 Benjamin Wright, an eminent engineer, was appointed by the Board of Canal Commissioners to examine the route of the canal as then established, with a

view to ascertaining whether there was a sufficient quantity of water within the legitimate authority of the State of Illinois to supply a canal of the dimensions of the one then contemplated upon the summit level of the line of the canal. Mr. Wright reported to the Board of Commissioners October 23, 1837, saying (Abst., 2835):

> "The DesPlaines River was not in a proper situation to gauge, as there had been copious rains; I, therefore, take the former measurements of the United States Engineers, as stated in the reports of the Canal Committee, at 54,800 cubic feet per hour."

The report then showed that when the canal was in operation it would require not less than 500,000 cubic feet of water per hour, and he continued:

> "These premises being admitted, we have to look for 445,200 cubic feet of water per hour more than the DesPlaines gives us at low water." (Abst., 2835.)

In the report of the Canal Commissioners to the General Assembly in July, 1837, they state (Abst., 2051):

> "The past dry seasons rendered the measuring of the DesPlaines almost unnecessary, since for nearly four months the tightest dam that could be erected, would not, at the point for taking out the feeder, have saved water enough to propel a single pair of ordinary millstones."

Lyman E. Cooley, the chief expert witness for the Government, in a report to the Internal Improvement Commission of Illinois to Governor Deneen, February, 1907, said:

> "From the end of the twelve-mile level to Lake Joliet was seventeen miles,—a mere surface stream over the rock bed—with a steep declivity over the lower half of the distance descending to a level of 76.5 feet below Lake Michigan." (Abst., 1938.)

In the same report he said:

> "The DesPlaines River practically goes dry above Joliet." (Abst., 1938.)

In a work entitled, "Lakes to Gulf Waterway," written by Mr. Cooley in 1891, referring to the DesPlaines River, he said:

> "The record shows that about one-half of all notable rises in fifty-six years, have occurred at the spring break-up, when the river could not be navigated on account of ice, and that floods which have occurred at other times of a height of fourteen feet and over, have not for fifty-six years, averaged three days out of banks, and probably for one-half of this time, not above fourteen feet, or over the limit of 30,000 to 35,000, cubic feet per second, discharge, which is stated as the navigable limit in the above extracts * * *.
>
> The long low-water period, and the extremely small volume of flow at such times, makes it necessary to contemplate the full depth to be relied upon as available for navigation, the same as for the Chicago divide; *and also, to use water from Lake Michigan, even for an exclusively slack-water scheme of small proportions. The present small canal has always had to rely on this source down as far as the Kankakee, and even below this point, the natural supply may, at times, be quite inadequate for any considerable commerce. The high water period is altogether too brief and uncertain to possess any availability for navigation greater than will be due to the minimum depths which the project contemplates.*" (Abst., 2031-2032.)

Isham Randolph, who was chief engineer of the Sanitary District of Chicago, and who presented to the War Department the protest against the building of the dam in question, stated in one of his reports that the entire low-water discharge of the DesPlaines River could be taken through a six-inch pipe. (Abst., 1075, 2849.)

Jacob A. Harmon, in a report of the Illinois State Board of Health, dated 1901, said:

> "The DesPlaines River at Riverside, a few miles above Joliet, goes entirely dry at that point nearly every fall, and for days and weeks at a time there is no appreciable flow. * * * Practically all of the

flow of the DesPlaines River as it reaches the Illinois, is therefore, during dry weather, Chicago sewage." (Abst., 2817-2818.)

There was also introduced in evidence in this case and in the State case, a chart of certain gauge readings at Riverside which is of the utmost importance as showing the condition of the river in a state of nature, because these readings were taken at a point above that where the waters of Lake Michigan were conveyed into the DesPlaines by the Illinois and Michigan Canal and the Sanitary District Canal. We show elsewhere that the Court of Appeals failed utterly to understand the significance of these gauge readings.

The Supreme Court of Illinois refers to this evidence as follows:

> "A chart showing the gauge readings at Riverside, a point twenty-eight miles above Joliet, shows the number of days in each year during which the river was dry at this point, which indicates that there were from twenty-four days in 1890 to two hundred and thirteen days in 1895 during which the river was dry at this point. This chart also shows the number of days during each of these years when there was a discharge of less than six inches of water at Riverside, the result of which is, totaling the number of dry days and the days showing less than a six-inch discharge, that there were from one hundred and twenty days in 1888 to three hundred days in 1901 when the river was either dry or showed less than six inches of water at Riverside. The depth of the river during the balance of the year is not shown on this chart. These gauge readings also show that the dry or low periods did not occur during the same time in each year. Every month in the year is represented several times during the years covered by this chart, from which the conclusion is drawn that there were no regular periods when a given stage of water could be safely expected.
>
> We refer to the readings on the Riverside gauge,

not because of their bearing on the question of navigability, at that point, but for the reason that they tend to show the natural volume of water in the channel above the points where the volume is increased by the additions made by the Illinois and Michigan Canal and the drainage channel, which added from 250,000 to 400,000 cubic feet of water per minute to the river below the point of connection."

People v. *Economy Light & Power Co.*, 241 Ill., 323-324.

g.

TESTIMONY OF EXPERTS AS TO NAVIGABILITY OF THE DESPLAINES.

Expert witnesses were called on behalf of both parties in the State case, and their testimony was introduced in the instant case. Robert Moore, former president of the American Society of Civil Engineers, a member of the Board of Engineers planned for the United States the deep waterway channel in the Mississippi known as the Southwest Pass, which has now a greater channel than the Eads Jetties. (Abst., 2601, 2605, 2606.)

L. L. Wheeler was for many years in the employ of the United States government in connection with its waterways, and had charge of the construction of the Hennepin Canal, and also of the survey of the DesPlaines River for the United States. (p. 2683.)

Thomas T. Johnson devised the methods by which the Chicago Drainage Canal was afterwards dimensioned, and he conducted the measurements of the flow of the DesPlaines River. (Abst., 2733.)

These witnesses all testified that the river was not navigable.

In addition, nine expert navigators of large experience testified to the same effect. One of these was the

president of the Anchor Line running from St. Louis to New Orleans, Isaac N. Mason (p. 2679), another William P. Grey (p. 2769), whose exploits in swift water steamboating upon the Snake River, are probably unparalleled in the history of the country.

It was our contention in the State case, however, and it is our contention now, that expert evidence as to navigability is of but little value as against the significance of the fact that "no use for purposes of commerce has ever been made of the river."

The Supreme Court of the State of Illinois in the Economy Light & Power Company case, 241 Ill., 336 said:

> "A large number of witnesses testified, some from personal observation, and others as experts upon this issue. As might be expected, these witnesses testified to opposite opinions in regard to the navigability of this river. It is not practicable nor desirable to discuss this evidence in detail. Whatever may be thought of the preponderance of it one way or the other, it can have but little weight as against the uncontroverted fact that the river has never been used as a public highway for commerce."

In the present case the United States introduced four additional experts. Not one of them testified that the DesPlaines was a navigable stream within the definition laid down by the authorities.

Montgomery Meigs said that according to his definition of a navigable stream, any brook up or down which a boat drawing six inches of water, could be forced, is a navigable stream. (p. 876.) The river having been described to him in a hypothetical question (pp. 872-873), he said that in his judgment it was not capable of being used for purposes of profitable navigation in the way in which commerce is usually carried on to-day. (p. 877.) And he further testified that as he saw it on the 28th of

December, 1910, he should say it was not capable of being profitably used for purposes of commerce under its then condition, and he admitted that it was only common sense to conclude that the river was not navigable if there was no evidence that, when there were no railroads, and in the spring of the year when the country was soft any settler living along its banks, ever came to Chicago by that river. (Abst., 880.)

Another witness called by the government was B. F. Thomas, who, with Meigs, made an inspection of the river on the same day, the afternoon of December 28, 1910. He judged from what he saw, that it was navigable. (p. 812.) He took no measurements of depths, he knew nothing of the conditions at the bottom as to bowlders, he did not know what the fall of the river was. He admitted that the river could not be navigated by steamboats, and that he had never seen gasoline boats that could climb slopes such as existed upon that river. (Abst., 838-839.)

The testimony of the other two Government experts is negligible.

h.

THE OPINION IN PEOPLE V. ECONOMY LIGHT & POWER COMPANY, 234 U. S., 497, INDICATES THAT THIS COURT DID NOT CONSIDER THAT THE ACT OF MARCH 3, 1899, APPLIED TO THE DESPLAINES RIVER.

The writ of error taken by the State of Illinois was dismissed for want of jurisdiction. In order to decide only the question of whether the State court had jurisdiction to enforce a Federal right, it is submitted that the opinion in that case could have been limited, after the statement of facts, to a few words found on page 524: "The State is not the instrument through which the jurisdiction can be exercised." But the court considered not

only whether a Federal right was asserted in the co
below, but whether one existed.

We have above (p. 92) called attention to
references in that opinion to the submission of the pl
of appellant's structure to the War Department,
to the conclusion which the court reached: "It is ma
fest, therefore, that the State has no right under Fede
laws which it may assert for itself or on behalf of
the citizens of the United States."

To properly interpret the opinion and to understa
why this Court discussed certain questions in it, it see
to us necessary to have in mind that what this Co
said about those questions was in direct response to pe
tions taken by counsel for the State in their brief, an
tensive abstract of which is reported in connection w
the opinion. Counsel for the State insisted that a F
eral right existed, because the DesPlaines was a stre
which came within the scope of the Act of March
1899, relying, among other things, upon the Ordinance
1787 and the early Acts of Congress.

This Court disposed of the contention as to the Or
nance of 1787 in two ways, (1) by referring to the *Wi*
mette Iron Bridge Co. v. *Hatch,* 125 U. S., 1, which ho
that the Ordinance had no such effect as was sou
to be given to it in this case, and (2) by stating that
fact of navigability having been decided against the St
by the State court, there was no Federal right left to
reviewed.

This Court also took up the claim of counsel for
state that the Supreme Court of Illinois excluded fr
consideration the fact that by reason of the addition
water by the Sanitary District Canal, the DesPlai
had, as was claimed, become navigable. Replying to
contention of counsel that "If those public rights

created or protected by Federal law, this court has jurisdiction to reverse the judgment," this Court said:

> "The inquiry immediately occurs, How did the so-called public right arise? From the mere addition of water to the river, or by the conditions upon which it was admitted?"

Further, it considered the claim that certain Acts of Congress appropriating money for a survey and estimates of cost for the improvement of the upper Illinois and lower DesPlaines Rivers in Illinois, was a recognition by Congress of the navigability of the river, and disposed of it as follows:

> "The cited Acts are not appropriations for improvements undertaken, but for improvements which may be undertaken; not a jurisdiction exercised, but a jurisdiction to be exercised."

We submit that these observations by the Court, while not necessary to the decision that the case should be dismissed for want of jurisdiction—which conclusion resulted from the holding that the State could not assert a Federal right—indicate the opinion of this Court as to the effect of facts which are vital in the decision of the present case. In effect this Court said that not only did it have no jurisdiction over the case, but also that the United States had no jurisdiction over the DesPlaines River.

Point XII.

THE COURT OF APPEALS WAS LED INTO MANY ERRORS OF FACT, AS TO MOST OF WHICH, THERE WAS NO CONFLICT IN THE EVIDENCE.

The opinion contains many errors of fact. The Court is not called upon to weigh conflicting evidence as to most of these. In important particulars the Court of Appeals stated as facts, matters which were supported by no

evidence whatever but were in contradiction to all the evidence. Thus the Court says (256 Fed., 798):

> *"After the year* 1848, *when the Illinois and Michigan Canal was constructed, commerce that had formerly been carried on the DesPlaines River was carried on the canal."*

In this statement the Court was misled by an assertion contained in the brief of counsel for appellant. This statement conflicts with the statement upon the same page as follows:

> "The trial judge found, as the record shows, that there is no evidence of actual navigation within the memory of living men."

There were a number of "living men" who were witnesses in the State case and whose evidence was read in the instant case, who lived along the banks of the DesPlaines prior to 1848. Some of the testimony was introduced by appellant and other like testimony by appellee. None had ever seen any boat larger than a skiff or rowboat upon the river and none had ever seen a boat upon it engaged in carrying passengers, produce or merchandise of any kind. Nearly all said it was incapable of such use.

In the opinion of the Supreme Court of Illinois, upon precisely the same evidence as to the attempted use of the river prior to 1848, it was said:

> "There is not in this entire record a well authenticated instance in which a boat engaged in commerce navigated the waters of the DesPlaines River."

a.

THE IMPLICATION IN THE FINDING OF THE COURT OF APPEALS THAT COMMERCE WAS CARRIED ON THE RIVER PRIOR TO 1848, WHICH WAS THEN SUPERSEDED BY THE OPENING, AND USE OF THE CANAL, IS CONTRARY TO ALL THE EVIDENCE ON THE SUBJECT.

Since we are undertaking to show that there is no evidence whatever upon which this finding of the Court can be sustained it will be necessary for us to refer to the testimony of every witness who resided along the banks of the river prior to 1848.

Franklin Collins came to Will County in 1833. He never saw or heard of boats carrying freight or merchandise on the DesPlaines River; there was no other way of getting produce to Chicago than by ox or horse teams, and he said "most emphatically" that in view of the difficulty in transporting merchandise and supplies to and from Chicago, if it had been possible to use the DesPlaines River it would have been used, and that, in his opinion, the only reason the river was not used was because it was not capable of being used. (Abst., 2586.)

George W. Read settled in Will County in 1829, and in 1833 he had seen a party going down the DesPlaines River singing and saying they were going to a warmer country, and that was the only boat, except skiffs, that he had ever seen. There were not many skiffs going up and down, only just what were used in Joliet *for the purpose of crossing the stream.* (p. 2104.) Read testified that the grain raised on his father's farm was taken to Chicago by ox teams, that the roads were full of teams going and coming. (Abst., 2105.)

Jeremiah Collins came to the vicinity of the DesPlaines in 1834. He never knew or heard of the river being navi-

gable, had never seen any navigation on the Illinois R
along where his father's farm was, or ever heard of
above Ottawa, and did not think there could have b
any without his knowing it. (Abst., 2649.)

John P. King lived in Will County since 1834. He
never heard of any boat being operated on the DesPlai
River at any time, for commercial purposes. A s
could not be navigated on that part of the river ab
Lake Joliet during flood seasons. He said "if you wan
to take the chance of getting drowned you could n
gate a skiff down the stream during flood seasons.
would not want to do it." He could cross the river
the riffles or rapids without getting his feet wet perh
two or three months in the driest part of the season,
for five or six months during the year the river would
at such a stage of water that it would be impossible
navigate rowboats up and down over the riffles with
dragging the boats. (p. 2559.) That the water wo
be low at least nine months out of the year. This is c
roborated by the readings of the Riverside gauge he
after to be referred to.

John McCowan came to the DesPlaines in 1835
wagon from Chicago. He said there was no other av
able means of getting into that country at that time
2593); that he had never seen or heard of boats ply
the river carrying merchandise or passengers; that
only way of getting produce to Chicago was by tea
and that he did not think it possible for boats to h
gone down the DesPlaines since 1835 *and up to the d*
of his testimony. (p. 2592.)

Adam Comstock came to Joliet in 1836. He "ne
knew of any boats used in the DesPlaines River for p
poses of commerce, such as carrying freight or pass
gers; never heard of any such boats before 1848 or aft

wards." He further testified that a skiff would have to be pretty skillfully handled or it would be apt to capsize, and that he never knew of anyone rowing a skiff from its mouth up the river during the high water season. (p. 2562.) He also had crossed the river without getting his feet wet.

David Layton had lived on or near the DesPlaines River since 1837, coming there when he was nine years old. He had never seen any boats carrying freight or passengers, or used for commercial purposes, navigating the DesPlaines River at any place at any time; he had never heard of its being navigated; they could not come up by water any further than Ottawa before the canal, and they used to bring it from there by teams to Joliet, and merchandise was always brought between Chicago and Joliet by team. He himself, when fifteen years old, hauled wheat to Chicago. (Abst., 2553.)

John W. Taylor came to Illinois in 1837. He never saw any boats carry anything on the river. (Abst., 2276.)

G. H. Erhard was born in Joliet in 1838. He never saw boats used for commercial purposes except that he had seen rafts coming down the river. The rafts went to the Haven sawmill, near Joliet. He said that he had heard of merchandise being shipped on the river but he had no positive knowledge of any such transaction. (Abst., 2106-2108.)

George Alexander had lived in Will County since 1838. He had never seen any boats on the river carrying passengers or produce, and that nobody else had. (pp. 2487-2488.) That he had seen no boats except skiffs, and that, in the summertime, during ordinary stages of water, a well-loaded skiff could not go over the riffles. He also testified as to the stage route to La Salle.

Xavier Munch came to Will County in 1839. He never

saw any boats going up or down the river, except
boats. (Abst., 2516.)

William S. Myers had lived on the river since 1
When he came there he was twenty-six years of age.
testified that no boats used for commerce ever ra
or down that river, and that merchandise from St. L
was brought to Ottawa by boat and thence to Lock
by wagon. (Abst., 2507.)

Harlow H. Spoor was born in 1820 and moved to
County in 1844. He testified that he had heard of a
ticular circumstance related in a book called Woodr
History of Will County on the Kankakee.
story as there told was that in 1834 some
ties loaded a boat with oats, wheat and h
with the design of taking them to Chicago
supply the garrison stationed there; that the trip d
the Kankakee was accomplished without accident or
usual trouble, but after entering the DesPlaines, w
near Treat's Island, the boat dipped water and so da
ened the grain that they were obliged to unload and
to dispose of their produce at that point. (pp. 2217, 2
2233.) If this tale were true it amounted only to t
that an attempt to come up the DesPlaines came to g
a little above its mouth. Spoor testified:

> "I don't know that I ever heard of a boat g
> from Joliet to Chicago on the Des Plaines with g
> or merchandise, that is not about their going thro
> the whole length of it, only this circumstance a
> the boatload of grain I was telling you about. *
> *I don't recollect at the present time any other*
> *that I ever heard of ever attempting to go up or d*
> *the Des Plaines with merchandise.*"

Spoor himself disposed of the story that boats ca
ing grain went down the Des Plaines, for he testified
grain was hauled by wagon.

"I don't think they hauled it by boats, because they had no way of hauling them." (Abst., 2234.)

George F. Gurney knew the river from 1845. He had never heard of commerce being carried on the Des-Plaines. There were riffles in the river which would break any boat. (Abst., 2508.)

Jacob Adler was familiar with the river before the canal commenced operation in 1848. He never saw a boat on the Des Plaines for commercial purposes. It was impossible for any boat to run up and down the river he said, giving his reasons. (p. 2538.) He had been on the river in a skiff, but in summer while the river was in its normal condition it was not possible to navigate a rowboat over the riffles; they got out and pulled it. (p. 2539.) He had never heard of any boats plying on the Des Plaines, transporting freight or passengers,—it would be impossible.

James Boyne came to Joliet in 1844 or 1845. He had never heard of any boats on the Des Plaines carrying passengers or freight. Produce could not come down the river because the river would not carry a boat. (p. 2521.) A skiff could not always be taken all the way up the river. (Abst., 2522.)

Lewis K. Stevens had lived in Joliet since 1836. He had never heard of any boats on the Des Plaines River used for commercial purposes. He said it would be an impossibility. (p. 2524.) Some seasons you would not know that the water run. You could walk over the rocks; it would seep through,—almost dry in places. Never saw any boats except little rowboats on the river. He described the dams and said that if there had been no dams it would have been impossible to have navigated the stream. (Abst., 2526, 2527.)

James C. Keen, born in 1824, came to Will County in

1843, coming to Chicago by boat and then by wagon Plainfield. Never knew and never heard of any boat the river used for commercial purposes, or of any me chandise or produce being carried on the river. (Abs 2569.)

Enos Field came to Illinois in 1847; he came by bo up the Illinois to Peru, from there there were teamste carrying freight by wagon to Chicago, and he never kn of any produce or freight carried on the Des Plaines of any boat transporting merchandise or freight. (Abs 2572.)

Urias Bowers came to Joliet in 1844, being then elev years old. His business has been boating along t Illinois River and the Illinois and Michigan Canal. H never knew of any boats carrying freight or passe gers on the river, nor of anything more than a ski (Abst., 2577.)

Oliver S. Chamberlain came to Will County in 183 and never saw or heard of any boats bearing produ or freight of any kind upon the Des Plaines. (Abst., 258 2581.)

R. W. Killmer came to Joliet in 1844, being th twenty-two years old. There was no way of gettin supplies or produce into that territory from Chica except by teams. He never saw nor heard of any bo navigating the river. There were times when there w scarcely any water running over the riffles. It was h opinion that if the DesPlaines ever could have been us that it would have been used. (Abst., 2599.)

James G. Elwood was born in Lockport in 1839 a moved to Joliet in 1843. He never knew of any boa on the river except skiffs, and he said he would n venture to send any produce on the river by any bo

adapted to commercial purposes. He boated and fished on the river but never took a boat up stream, as he never had any desire to go up against the current or the boulders. He had known the river at times to be so dry that no water was passing through it. (Abst., 2658, 2659.)

Samuel Gatons, a witness for the Government, came to Will County in 1844. He saw nothing on the river but a yawl boat, and that was when he was three and one-half years old. (Abst., 2272-2274.)

We have now referred to the testimony of every witness on each side who knew the Des Plaines prior to the opening of the canal in 1848, *and none of them knew or had heard of commerce carried on the river.*

b.

THERE IS NO EVIDENCE THAT IN EARLY DAYS BOATS OF THE DIMENSIONS GIVEN IN THE OPINION OF THE COURT OF APPEALS, WERE EVER USED ON THE DESPLAINES RIVER.

Another assertion of fact by the Court of Appeals which is without foundation in the record is the following—(256 Fed., 798):

> "Large quantities of supplies of various kinds needed by the settlers in a new country were also transported over the Des Plaines during the same period in boats of the size and character then commonly used in river commerce; this transportation being carried on between Chicago and St. Louis and other points. Canoes of several tons burden were used; some were 35 feet long by 6 feet wide, some 33 feet long by 4½ feet wide, worked by paddles and occasionally a sail, and had a crew of eight men, carrying as much as 6,000 pounds of freight, as well as 1,000 pounds of provisions. Pirogues were manned by six or seven oars; the bateaux were larger than the pirogues; the Durham boats were heavy freight craft 60 feet long, 8 feet wide, 2 feet deep,

with a capacity of 15 tons, drawing 20 inches
water."

There is not in the entire record a description
the dimensions of any boat used upon the Des Plain
River. In nearly every instance where boats were
ferred to they were canoes, and the record shows th
they were light boats which could be picked up and ca
ried for many miles. These dimensions of various kin
of boats were read into the record from various wor
but in no case was the quotation with reference to the u
of boats on the DesPlaines. The description
pirogues was taken from the Century Dictionary a
from the account of the journey of Lewis and Clark
the Missouri and down the Columbia. The Durham boa
were, as Prof. Thwaites said—"of the sort that th
navigated the Great Lakes with."

The only mention of Mackinaw boats in the reco
was in connection with the few seasonal trips made
the American Fur Company, which abandoned the u
of the Des Plaines because of the great difficulties e
countered, as pointed out in another portion of this bri
Thwaites expressly stated that he did not know what t
draft of the boats used by Hubbard in the fur trade wa
(Abst., 498, 499.)

The entire record contains but one reference to a Du
ham boat; that appears in "Drown's Peoria," an alm
nac, dictionary and advertising medium of flimsiest cha
acter, in which it is stated that in 1825 one John Haml
exported produce from Peoria to Chicago, carrying it
the DesPlaines part way in keel boats and part in Du
ham boats, building a storehouse at the mouth of t
Kankakee. This statement is highly improbable f
many reasons. First, because there is no other instan
in the whole record of the produce of the country bei

carried up the upper Illinois or DesPlaines by boat; second, because the physical conditions made it impossible for boats of that character to pass up or down the river, third, because persons who settled in the neighborhood within a few years thereafter, never heard of such an event or of any storehouse said to have been built at the mouth of the Kankakee, and, lastly, because there was no settlement at Chicago at that time which could have justified such an undertaking. There were but nine people in Peoria in 1825 and but three or four families in Chicago. (Abst., 1820-22, 1930-1932.)

The garrison had been removed from Chicago in 1823. (Abst., 1471.) At the period in question there was produced in Chicago "an abundance of all the luxuries of farm, cornfield and dairy." The difficulty was how to dispose of the amount produced. (Abst., 1472.)

c.

THE COURT OF APPEALS ALSO ERRED IN THE FOLLOWING STATEMENT:

"COMMERCE OF THIS CHARACTER EXISTED UNTIL ABOUT THE YEAR 1825. AFTER THAT YEAR THE FUR TRADE, HAVING RECEDED TO THE INTERIOR PORTIONS OF ILLINOIS, WAS REACHED MORE GENERALLY BY HORSES."

The reason why the fur trade was reached by horses is clearly given by Hubbard, the superintendent of the American Fur Company, which alone at that time was carrying on that trade in a passage quoted *supra*. That reason was the same which caused La Salle, the first white man who ever traded in that country, to say that it would be better to use horses than to attempt the use of the DesPlaines. Prior to 1825 the fur trade was already in the interior portions of Illinois. There was no change in that particular at that

time. Hubbard gave up all attempts to use the De Plaines in 1824.

d.

THE COURT OF APPEALS WAS IN ERROR AS TO THE ALLEGED US OF THE DESPLAINES "FROM THE LATTER PART OF THE SE ENTEENTH CENTURY THROUGH THE FIRST THIRD OF TH NINETEENTH CENTURY."

The Court of Appeals (256 Fed., 797), in the para graph entitled, "Use of DesPlaines River," says tha

> "from the latter part of the Seventeenth Centur through the first third of the Nineteenth Centur men engaged in the fur trade passed up and dow the Chicago and DesPlaines River in canoes an float boats very regularly. Fourteen specific in stances of the use of the DesPlaines down to th year 1830 are shown in the evidence as follows:"

The court then lists the trips to and from Chicag which constituted these fourteen specific instances. Mos of these trips were in light canoes, in the sprin or fall floods, and were not made by persons engaged i the fur or any other trade. The trips referred to wer as follows:

> "Up the river, Joliet and Marquette, 1673, ligh canoe. No actual evidence that the DesPlaines wa used at all. (Abst., 1531-1532.)
>
> Perrault, 1783. All that appears is that he wa directed to 'pass by Chicago.'"

This did not mean that the DesPlaines was use by Perrault, for La Salle, who had occasion to reach th Illinois with more extensive trade than any other perso went by the St. Joseph River passing Chicago (Abst., 2 279, 1601-1604), and Collot went to Chicago by way o the Calumet. (Abst., 88.)

> Joutel, 1688. Joutel went to and from Lak Michigan on foot. He made two trips on land for

distance of thirty or forty leagues, and although having canoes, they did not use them because there was no water in the river. On a third trip the canoe was dragged through the water. (Abst., 1739-1744.)

Hubbard, 1819. In time of flood.

Child, 1821, in a light canoe, with no cargo. No month given but in a time of high water so that he crossed the DesPlaines to the Chicago River in his boat; probably at a time of spring flood.

Tonty, in 1680. As to which trip there is no evidence that it was made in a boat. (Abst., 33.)

La Salle, 1681. On foot. (Abst., 1609-32-33.) His destination was not Chicago but St. Joseph.

Fonda, 1825. In a light canoe. (Abst., 1701.)

The trips from Chicago, referred to by the Court of Appeals, were:

Membre, 1682, on the ice, a distance of 80 leagues.

St. Cosme, November, 1698. Eleven or twelve days consumed, with a portage of 17-1.2 leagues, which practically eliminated the DesPlaines River. (Abst., 49-50.)

Hubbard, 1818. Under great difficulties, pointed out in his narrative—the goods being unloaded and the boats being put on rollers. (Abst., 123.)

Marquette, 1674. In time of flood in a light canoe. Marquette himself speaks of the ease of making portages of 30 leagues carrying his canoe, which gives a very good idea of the character of the boats used. (Abst., 1461.)

Heward, 1790, in a Pirogue, in the spring floods at a period of extreme high water. He speaks of a portage along rapids. Some of his men after passing Joliet told him that because of the dangers they might not return with him. (Abst., 82.)

Furman, April, 1829. In a canoe—the prairie being flooded. (Abst., 1703.)

We submit that the fact that these are the only specific instances the court could find of actual use of the river in a period of one hundred and fifty years, rebuts its conclusion that during that period "men engaged in the fur

trade passed up and down the Chicago and DesPlai
Rivers in canoes and flat boats quite regularly."

The Court of Appeals proceeds to say:

> "Many other trips made during the same peri
> not so well authenticated, are disclosed in the e
> dence."

This statement is without any support in the reco
and
~~nor~~, with the exception of a trip by Cass in a light ca
(Abst., 1321), no reference was made to ot
trips. It is true, as the court says, that th
are numerous historical references to the Chicago a
Illinois route. It is also true that that was a gene
designation of the route from Lake Michigan to the I
nois River, and that practically the Desplaines often
not used at all in traversing that route. Much of
time the portage extended all the way from Chicago
points well down on the Illinois.

On the other hand, the record contains accounts
attempts to use the river which failed. We have el
where referred to the experiences of Schoolcraft, K
nedy, Tanner, Charlevoix, La Houtan, La Salle and
Cosme, and the report of Graham and Philips.

We submit that in the light of these historical reco
and in view of the fact that in certain of
alleged specific instances of the use of the riv
listed by the Court of Appeals, the river was not u
at all, and of the difficulties involved in other of the tr
so referred to by it, the conclusion of the court that
stream was quite regularly used during the period m
tioned by the court is without foundation in the reco

Point XIII.

THE DESCRIPTION OF THE DESPLAINES CONTAINED IN THE OPINION OF THE COURT OF APPEALS IS TAKEN ALMOST BODILY FROM THE TESTIMONY OF LYMAN E. COOLEY. THAT TESTIMONY ITSELF IS FULL OF MANIFEST ERROR, AND IS LARGELY COOLEY'S OPINION OF WHAT THE RIVER WAS IN A STATE OF NATURE, NOT WHAT IT IS NOW. THAT OPINION WAS PURE CONJECTURE.

The chief engineering witness for the Government was Lyman E. Cooley, who admitted he had a deep personal interest in the result of the suit. (Abst., 669.) From 1875 he had devoted his time to the plan for a waterway joining Lake Michigan to the Gulf. (Abst., 670, 674.) He believed that the erection of the dam by the appellant was an obstruction to his cherished project, and he busied himself to procure the passage by the Illinois Legislature of the bill of December 6, 1907, recognizing the Des-Plaines and Illinois Rivers as navigable streams, and seeking to prevent obstructions being placed therein. That was aimed directly at the appellant. (Abst., 675.)

After its passage, Cooley, on behalf of the State of Illinois, swore, on December 30, 1907, to the information filed by the State against this appellant, and was employed by the State to assist its attorneys in the preparation and trial of the case.

From the beginning of that case to the end of the long trial he devoted nearly all of his time to it. (Abst., 675.) From the beginning of the present litigation he was very active in the preparation and trial, and was paid a *per diem* by the Government for his services.

His conclusions, as an engineering expert, had two aspects, first, as to navigable capacity of the river in a state of nature; second, as to its navigable

capacity in its condition after the construction of the Sanitary District canal. The true character of his work in attempting to depict the natural condition of the Des-Plaines, was indicated when he compared it with the work of Cuvier in reproducing an extinct mammal, or Agassiz in reproducing a fish from bones that are left. (Abst., 608.) Those scientists had an advantage over Mr. Cooley; the subjects of their hypotheses were extinct,—the DesPlaines River is here, and it is possible to see wherein he ignored, or misinterpreted, known facts, and assumed others which are unknown, whereby his conclusion becomes a mere hypothesis, and not a reliable indication of the river as it was in a state of nature.

Moreover, his hypothetical reconstruction of the river as it was in its natural state, and his testimony as to his knowledge of it before the connection with the Sanitary District canal, has this further disadvantage. Cooley had been writing about the river for years before this controversy arose, and he had made a distinct record as to his opinion of it which supports entirely appellant's contention, and is in agreement with the conclusions of the engineers engaged for the construction of the Illinois and Michigan Canal, and the various reports of Government engineers. In 1901 he wrote a report by the Internal Improvement Commission of Illinois, and in 1906 he wrote "The Lakes to the Gulf Waterway." In that he described the DesPlaines from the end of the Twelve-Mile Level to Lake Joliet, *as a mere surface stream over the rock bed,* with a steep declivity over the lower half of the distance descending to a level of 76.5 feet below Lake Michigan (Abst., 1938); and said, "*The Des-Plaines River practically goes dry above Joliet.*" Again, in 1891, he wrote:

> "The Desplaines has been measured twice for low water; in 1887, 256 feet per minute, and in 1879, 339

feet per minute, both between Riverside and Lockport." He said, "at least sixty per cent of the low water volume passing Morris in 1887 came from Lake Michigan by the Illinois and Michigan canal, and probably one-half of the volume in ordinary low water years comes from this source." (Abst., 2031.)

It will be seen later that these statements are in direct conflict with his claims as to an assumed depletion of the river by diversion into the canal. It recognizes what we elsewhere show to have been the fact that the canal did not deplete but added materially to the volume of the river.

In another report Mr. Cooley says (Abst., 754, 755):

"The dry-weather flow, or low-water volume, is very small, as has already been inferred from the physical characteristics of the watershed. In 1887, Salt Creek was entirely dry at Fullersburg. The DesPlaines, at Riverside, reached a minimum of 4.27 feet per second (256 feet per minute), and for five months did not exceed 1,000 feet per minute. The stream has been known to be lower than this, but has never wholly run dry.

In 1879, a discharge taken by Mr. Matthewson at Romeo, four miles above Lockport, gave a volume of 5.65 cubic feet per second (339 feet per minute). The minimum volume at Riverside would not be increased, in fact, might be diminished, in passing through 'the twelve-mile level,' by evaporation and vegetation, in the run to Joliet. Three hundred feet per minute may be assumed as the mean extreme low water at Riverside and at Joliet, with a volume below 1,000 feet for several months of nearly every year."

Other statements of Cooley of like character are referred to elsewhere in this argument.

Mr. Cooley ignored, or was ignorant of, certain other authoritative scientific writings, which stated facts inconsistent with his testimony that there had been no artificial additions to the river.

Ossian Guthrie, in his work "The Great Lakes a
Their Relations to the Lakes and Gulfs Waterway
gives a table of the operation of the Bridgeport pum
pointing out that they added materially to the volume
the river. (Abst., 1045.)

Leverett, in his "Water Resources of Illinois," e
said (Abst., 2050):

> "Prof. Cooley reports that at Riverside in 1887,
> reached a minimum of 4.27 feet per second; and
> *five months did not exceed* 16 2/3 *cubic feet*
> *second.* He estimates that for nearly every year
> extreme low water flow at Riverside and Jol
> reaches about 5 cubic feet per second."

Post and Paul, the engineers who made the first surv
that was ever made of the route of the Illinois a
Michigan Canal, found the discharge of the DesPlaines
be but 20 cubic feet per second. Dr. Howard, Unit
States civil engineer, in 1829 found it to be but about
cubic feet per second, and engineers Harrison and Gui
in 1830 found it to be about 17 cubic feet per secon
(Abst., 1071, 3085.)

Col. Wilson, Chief Engineer of the United States Arm
in his report on the DesPlaines of December 17, 18
said "*the river itself* (*the DesPlaines*) *except*
floods, is very shallow, being often reduced in dry se
sons to a mere brook discharging less than 1,000 *cubic fe*
of water per minute." (Abst., 1072, 2843.)

William Gooding, chief engineer of the Illinois a
Michigan Canal, in a report dated December 15, 18
(Abst., 2865) says:

> "DesPlaines River, Post and Paul, 1950, by Bu
> lin, 1000 per minute. * * * Calumet 5,333, D
> Plaines 1000, Dupage 1655—7998 cubic feet
> minute. * * *
>
> Quantity of water in all these streams continu
> to diminish till the 1st of November, when the to

would be about 7,300 cubic feet per minute for all three rivers. The water necessary to supply the canal from Chicago to Marseilles is 9924 cubic feet per minute, or a deficiency of 2624 cubic feet per minute."

"The construction of a perfectly watertight dam at Joliet has enabled us to ascertain with precision the quantity of water flowing in the DesPlaines. This river has been nearly dried up; the measurement on the 20th of September showing 338 cubic feet and on the 21st of the same month 373 cubic feet per minute." (Abst., 3116.)

From these statements it is certain that Mr. Cooley was in error in stating that a considerable volume of water was to be found in the DesPlaines in a state of nature, and that it had been depleted by the changes in the river.

Cooley's estimate, incorporated by the Court of Appeals in its opinion, of the number of days when, in a state of nature, boats could pass over the divide between the DesPlaines and the Chicago, or down the DesPlaines River has no value, because it depends entirely upon the accuracy of Cooley's hypothetical reconstruction of the river as it was in a state of nature. It has to do with a laboratory, and not a real, river. He says he made his computations by taking into account the increase of the volume which would result from an increase of drainage area down the stream, and deductions in area from a state of nature, because of the drainage of certain swamps and the addition of certain other areas. He also took into account assumed deficiencies in rainfall and runoff, due to deforestation, and also the effects of inhabitation.

The fact that the depths are given with remarkable nicety of precision even to tenths of feet, discloses that they must have been premised either upon precise data

as to all hydraulic factors involved in the conditions dur
ing a state of nature, which is impossible, or on a ver
liberal assumption of those hydraulic factors, which lat
ter is obviously the fact.

The liability to error in making computations of th
volume of flow, is illustrated by the fact that the Sani
tary District Channel, of practically uniform depth an
width, and every hydraulic factor of which was sup
posed to have been precisely ascertained, was compute
to carry 10,000 cubic feet per second. When it was com
pleted according to the specifications upon which the com
putation was based, it had a flow of 14,000 cubic fee
per second (Abst., 2066), and Mr. Cooley had charge o
that matter. Consider then the absolute impossibilit
when the hydraulic factors are as uncertain as they ar
here, of computing the depths with any approximation o
accuracy. The margin of variation between the depth
given, and those which would be prohibitive of the navi
gation Cooley describes, is so small that his conclusio
cannot be more than an interesting hypothesis. They ar
a matter not of feet, but of inches of depth.

One of the most important factors in his computatio
was his assumption of what certain flood levels over th
divide between the Chicago and DesPlaines Rivers woul
probably have been had it remained in a state of natur
Yet he testified he had never seen a cross section of th
original divide, and does not think one could make a
accurate determination of a probable flood line in a stat
of nature, without a map showing the depth, and widt
of the country east of the divide and all the hydraul
elements therein. For his purposes he caused one Par
to make a drawing, called "Parry's Exhibit 2," wher
in he assumes to depict these flood lines. But he al
assumed the elevation of the original bottom, which w

the most important factor in determining the nature of the divide. (Abst., 691-693.) Parry said he "simply followed Mr. Cooley's instructions" in the making of it, and that the "probable flood line" of 1892 across the divide, "is not intended to be accurate." (Abst., 549.)

Again, the futility of attempting to predicate navigation upon a flood condition, is shown by the fact that according to Cooley's testimony the flood of 1892, when he says a steamboat could have passed over the divide had it remained in a state of nature, was at the line he computes only for one day (Abst., 695), and, as we have shown, in his writings he had stated that the floods, subsided with great rapidity. Again in connection with the flood of 1881, which Cooley used as an important factor in his computations, he could not recall who made the data from which he projected the elevation which that flood would have shown on the Riverside gauge. (Abst., 694.) He disclosed that, among others the factors lower down the river upon which he premised his upper volumes, he considered an amount of water, which he could not recall, used by the canal and mill wheels in Joliet. (Abst., 695-696.)

Mr. Woermann, who at the time of testifying was one of the highest salaried engineers employed by the United States Government, in referring to Parry's Exhibit 2, said: "the hydraulic elements which affect the volumes of discharge and elevation of the water surface are so indeterminate that it is impossible to determine the flood with any degree of accuracy." (Abst., 1085.) These floods passed very rapidly and have little, if any, significance on the problem of navigability. (Abst., 1086.)

One factor Cooley took into account was alleged deforestation above the Riverside gauge. As to the extent of

this he was in error and the Court of Appeals in its opinion accepted his error as a fact. He admitted that he had made no investigation to ascertain the fact. He said that one-half to one-third of the river basin was originally wooded area, of which 25 per cent had been removed. The original Government township maps of the DesPlaines Basin show that not to exceed 25 per cent of its area was wooded, and a large part of that wooded area still remains. (Abst., 1053-1054.) Further, Cooley did not consider the contributions to the flow of the river by sewage and drainage from the towns upon the upper DesPlaines, all of which discharge their run off into the DesPlaines (Abst., 700-701), and country drainage from areas which before inhabitation never discharged water into the river. (Abst., 1056.)

Cooley did not attempt to gauge the hydraulic effects of variations in width and declivities, and there is no authority in any existing profiles of actual soundings of the river, for the depths which he testified existed at the several volumes of flow.

Cooley also attempted to establish depths in a state of nature by inference from the low-water line of 1883. He used a map, "Cooley's Exhibit 2," purporting to depict the river, in profile, from Joliet to its mouth, and to show the three shallowest points at 2.6 feet, 2.2 feet and 1.25 feet. In 1883 the DesPlaines was not in a state of nature. Cooley contends that it was depleted by various artificial works which he enumerates. As a matter of fact the flow was materially increased beyond that which was maintained in a state of nature, by the contributions of the Illinois and Michigan Canal.

Depths shown in a profile indicate nothing as to other depths in the same cross section, except that there is no greater depth. Profiles depict the thalweg of the stream,

or line of greatest depth. They do not indicate a boatable depth, and take no account of boulders and other obstructions, or the sinuosities of the thalweg. These facts were overlooked by the Court of Appeals when it referred to depths of the river. (Abst., 1085.)

Point XIV.

ERRORS OF THE COURT OF APPEALS AS TO THE RIVERSIDE GAUGE. THE READINGS OF THAT GAUGE CLEARLY SHOWED, AS WAS POINTED OUT BY THE SUPREME COURT OF ILLINOIS, THAT THE DESPLAINES RIVER WAS NOT ONLY NOT NAVIGABLE, BUT THAT DURING THE SEASON OF NAVIGATION IT WAS FOR A CONSIDERABLE PORTION OF THE TIME PRACTICALLY DRY.

There appears in the opinion of the Court of Appeals (256 Fed., 795-796) a reference to the gauge record kept at Riverside, and to the conditions which prevailed at various stages of water shown by that gauge. We think no one reading it could fail to be misled, as that Court evidently was misled, as to the actual fact. The natural impression is that the Court was speaking of conditions now existing, when, in fact, all were conditions which Mr. Cooley, the witness upon whose testimony these findings were predicated, thought would have existed in a state of nature—had there been no drainage, deforestation or diversion of water from the river. Cooley was asked to consider "this divide in a state of nature, based upon the computation and examination of the volumes of water in the DesPlaines River and the topography of the Continental Divide, and then to say at what elevation on the Riverside gauge the water would have flowed over the Continental Divide." (Abst., 581.) As we ~~shall~~ have shown hereafter the height of the Continental Divide was a mere assumption.

Whatever it was, no boat has passed over it since 182
and that boat was a canoe in time of flood. The River
side gauge readings, to which the Court refers, but th
significance of which it clearly misunderstood, are amon
the best proofs that the stream in a state of nature wa
not navigable.

The gauge was established by Cooley himself in 188
for the purpose of measuring the amount of water in th
river. In order to a proper understanding of the read
ings of this gauge, it must be borne in mind that when i
is said that the gauge registered a certain number of fee
say for instance, 12.4 that does not mean that ther
would be that depth in the river. The measurements wer
not from the bed of the river, but from Chicago datum
The gauge was set in a pool where the water would stan
around it, even if there was no flow in the river. (Abst
2744.) *Until the gauge reads* 11.4 *feet there is no dis
charge into the DesPlaines River.* (Abst., 689-2744-5.
Therefore, when any depths are mentioned above 11.
the actual discharge into the river is the difference be
tween that depth and 11.4. At and below a reading o
11.4 feet the river, except in pools, would be dry, so tha
one could walk across it without wetting the feet. (Abst
2745.)

The real significance of these gauge readings appear
in an analysis, and table, prepared by Mr. Woerman, th
accuracy of which is not challenged (Abst., 1939, 1947
and from which it appears that in every year from 188
to 1910 where the gauge readings are complete, there wer
from 24 to 213 days *when there was no discharge whatev*
in the river, and it further appears that there were
each year from 120 *to* 300 *additional days* when there wa
a six-inch depth or less.

Cooley testified that, according to these gauge rea

ings, the water would have flowed over the divide on an average of over seventy-three days a year, permitting boats drawing 15 inches of water to pass from the Chicago River into the DesPlaines. The first difficulty with this statement is that it is predicated upon Cooley's purely theoretical assumption of what the elevation of the divide was in a state of nature. Next, that the average flow throughout twenty-four years, was of no consequence because, according to Cooley and other witnesses, the river was subject to great floods, quickly receding, and at other times was practically dry, the dry season being summer, which was the natural period for navigation.

Cooley's table of average days of certain depths (Abst., 590, 961) has no value on the question of navigability, because it covers the entire year, and not the navigation season from April 1st to December 1st; and further the table takes no account of whether the days are consecutive or not. (Abst., 1066.)

For instance, the table shows 65 days in 1887 when the gauge reading was 13.8 or higher, but those days were scattered through several months. The period of 13.8, or over, began on January 23rd and continued until March 21st. Then the water was lower than 13.8 during the remainder of the year until December 8th, when there were six days with a reading of 13.8 or over. Then it was below 13.8 until December 20th, and it continued so for 5 days, so that all the days when it was 13.8 or over were outside of the season of navigation.

Cooley's table represents that in 1887 there were 88 days when the water stood at or above a reading of 13 feet at Riverside. This period began January 23rd and continued to March 25th. During the remainder of the year it was lower than 13.0 until December 7th, after which for the rest of that month it was 13.0 or higher,

so that all the days of 13.0, or higher, were outside t navigation season, except April 4th, when the reading w a trifle over 13.0.

On Cooley's table, 1887 is accredited with 2 days in which the reading was 11.85 or higher. 106 these days occcurred between January 23rd and Ma 8th. From May 8th to July 17th there were 69 days whe the reading was below 11.85. From July 17th to Augu 4th there were 18 days of 11.85 or over, followed by ni days with a reading below 11.85. From August 14th September 1st (19 days) it stood above 11.85. Then fo 3 days it was below 11.85, and then from September 4 to the end of the year (118 days) above 11.85. Fro January 21st to 22nd and from June 15th to July 17t (54 days) the gauge showed no discharge—being belo 11.4.

All of the 62 days the gauge showed for 190 with a reading of 13.0 or over, occurred betwee February 29th and April 28th, inclusive. In 1904 ther were 158 days when the gauge showed no flo at all, as follows: January, 19 days; June, 22 days July, 30 days; August, 20 days; September, 26 days October, 8 days; November, 8 days; December, 25 days During 74 additional days the gauge showed less tha 6 inches of water at Riverside: January, 4 days; Feb ruary, 2 days; June, 7 days; August 8 days; September 2 days; October, 23 days; November, 22 days, and De cember, 6 days.

When the gauge showed no water passing Riverside ordinarily there would be no flow below Riverside, unti the mouth of the Dupage River, from which there migh be a flow of from 20 to 50 feet per second for a shor period, due to rains.

Point XV.

Errors of the Court of Appeals as to changes in the river.

The Court of Appeals (256 Fed., 796) refers to "changes in DesPlaines River." What follows is practically the testimony of the witness Lyman E. Cooley, which is demonstrably full of errors in essential particulars. Its purport was that the volume of the river as it was in a state of nature, has been materially reduced by various causes. This was to overcome the obvious fact that it is not now, and has not in the memory of man, been capable of any sort of navigation.

The Court of Appeals, following Cooley, find the "first change of significance was due to the construction of the Illinois and Michigan Canal in 1848." The fact was established that below Joliet in the portion of the river where appellant's dam was being erected, the volume of the river was very materially increased by the opening of the canal.

The value to be attached to Cooley's assumption of depletion of the river by the construction of the Illinois and Michigan Canal, is indicated by his lack of knowledge of certain vital facts. He knew how much water was contributed from Lake Michigan to the DesPlaines, but he did not know how much water was needed for the canal where it left the river at Joliet. Manifestly so much of the contribution from Lake Michigan as did not go down the canal, passed down the channel of the DesPlaines below Joliet, over the site of the proposed dam, and into the Illinois River. Cooley knew that the contributions from Lake Michigan by the Deep Cut through the canal to the DesPlaines reached from 15,000 to 30,000 cubic feet per minute. (Abst., 706-707.) He did not know the

amount contributed by the Bridgeport lift wheel, which was a very considerable amount. (Abst., 704-2753.) (The Court of Appeals mentions this Bridgeport pump as one of the "interferences" with the natural volume of the river, evidently supposing that it pumped water out of DesPlaines. As a matter of fact it pumped water out of the Chicago River and into the canal whence it was discharged into the DesPlaines.) The amount needed for the canal below Joliet is variously stated from 2,800 cubic feet (Abst., 1047) per minute to 9,000 cubic feet per minute as a maximum. (Abst., 2753.) Therefore the volume of the DesPlaines River below must have been largely increased by the canal and the pumping works. Cooley did not know how much water the canal took out below Joliet, or what proportion of the waters contributed by the Deep Cut went past the mouth of the canal at Joliet, and thence down the DesPlaines, and what part was diverted by the canal (Abst., 707), and he did not know that five mills below the point where the canal left the river at Joliet, possessed rights to the uses of certain portions of the water that could not be diverted for use of the canal. (Abst., 2903-2904, 2906-2907, 2925.) One was Haven's Mill at Joliet, below the mouth of the canal, and four others were on the level of the canal within the City of Joliet, all of which operated by water drawn from the canal and discharged back into the DesPlaines. (Abst., 704-706.)

In *Druly* v. *Adams,* 102 Ill., 177, which was litigation concerning the right to use the water at the Haven mill, it appeared that there was a surplus contributed to the DesPlaines by the canal of 25,000 cubic feet per minute not needed for navigation upon the canal. (Abst., 2903.)

In certain works of which Cooley was the author, written sometime before the giving of his testimony, he stated

that the water in the river below Joliet was, for the most part, contributed by Lake Michigan, by means of the canal.

Point XVI.

THE ACT OF THE GENERAL ASSEMBLY OF THE STATE OF ILLINOIS PROVIDING FOR THE CONSTRUCTION OF THE SANITARY DISTRICT CHANNEL WAS EXPRESSLY FRAMED TO PRESERVE AND PROTECT THE WATER POWER RIGHTS OF RIPARIAN OWNERS ALONG THE DESPLAINES.

We refer to this fact because in the briefs filed in the Court of Appeals, there was an attempt to inject into the case an element which had no proper place there. We cannot assume that the same attempt will not be made here.

Counsel for the Government sought to create the impression that Mr. Munroe undertook to acquire a water power where none had before existed, by taking advantage of the expenditure of some $50,000,000, or more, on the part of the Sanitary District to increase the volume of water turned into the DesPlaines River. Two facts are important in connection with this claim: first, that a water power existed and was availed of by a dam erected in 1833 at the site of the proposed dam; second, that the Statute of Illinois, which permitted the creation of the Sanitary District channel, expressly provided for the protection of the private rights of the owners of all water powers upon the river.

Several water power dams at points below the junction of the Sanitary District with the DesPlaines existed from the earliest days of settlement. A summary of them is given at page 2084 of the abstract. It was, of course, known to the legislature when they passed the Act creating the Sanitary District, that these water powers

would be greatly increased and rendered more val
by the addition of the waters of Lake Michigan,
preserve them to the owners, Section 7 of that Act
vised Statutes of Illinois, 1917, p. 418, provided a
lows:

> "In no case shall said Board (Board of Tru
> of the Sanitary District) have any power to co
> water after it passes beyond its own channel, w
> ways, races or structures into a river or na
> waterway or channel, or water power or doc
> uated on such river, or natural waterway
> channel."

The water power in question here is far below the
where the water passed from the channel of the Sani
District.

This purpose to preserve to the private owner
water-power rights was further emphasized and effe
by Section 23 of that Act, in which appears the follow

> "This Act shall not be construed to authorize
> injury or destruction of existing water po
> rights."

The legislature must have intended that the exis
water powers which would become valuable in the n
ern sense should be preserved and protected. The
guage could refer to nothing else. And indeed it
well known fact that the preservation of these w
powers was debated, and thoroughly considered by
legislature, and that the provisions of the statute
ferred to were incorporated for the express purpos
protecting them. (pp. 2020-2023.)

The evidence shows, that Mr. Munroe had perfected
financial arrangements for constructing the dam
power house before he had any negotiations with
Economy Light & Power Company. (p. 3182.) Ass
ated with him in the enterprise was Frank G. Loga
well known capitalist.

Counsel for the Government also suggested in their brief in the Court of Appeals, that Mr. Munroe obtained from the State whatever rights it might have had in connection with the water power at Dresden Heights through what they characterized as "frugal arrangements" with the trustees of the Illinois and Michigan Canal.

The decision of the Supreme Court in *State* v. *Economy Light & Power Company* makes it clear that the State had no rights in that connection, and that its ownership was only of the canal and its tow banks, and a very few acres of worthless lands that it had never been able to sell, and which Munroe bought at the price at which it had been carried for years on the books of the trustees. These contracts have been declared valid by the opinion of the Supreme Court of Illinois just referred to.

Point XVII.

Testimony of historical experts, and publications offered in evidence.

Charles W. Alvord, Reuben Gold Thwaites and Andrew McLaughlin, historians, were called by appellee to draw conclusions, from narratives, translations, and compilations which Alvord had collected. We do not deem it necessary to lengthen this brief by an analysis of their evidence. Those conclusions are of little value in determining the present issue; first, because the application of the Act of March 3, 1899, to the DesPlaines River does not depend upon such use as was made of it in primitive days; second because they testified to no instances of the use of the river which are not referred to in the opinion of the Court, which instances we have already discussed; and, lastly, because it is the province of the court and not of historical experts, to determine what inferences may properly be drawn from the evidence.

Thwaites and McLaughlin confined themselves to excerpts collected by Alvord, and Thwaites declined to be examined as to other matters. When he was asked by counsel for defendant if there was any significance in the fact that horses and wagons were used for the whole length of the road portage, from Lake Michigan to the Illinois, at a period before the settlement of the country, for the purpose of transporting goods and merchandise, Thwaites replied, "The Government did me the honor to ask my opinion relative to certain historical incidents. That is not among them, and I have not made a study of this wagon route."

He further said:

> "My conclusion was based on the evidence which the Government submitted to me for my opinion."

McLaughlin said: "I made no very satisfactory study from the sources of the early travels in this country, the early explorers" (Abst., 337), and counsel for the Government objected to cross-examination of him as to excerpts which he had not examined. (Abst., 339.)

It is also to be observed that Thwaites' attention was called to but part of the evidence submitted by Alvord, and McLaughlin's to still less. The conclusions of Alvord and Thwaites are substantially the same. McLaughlin's is somewhat more conservative. Alvord said that it was his "opinion that from the latter part of the seventeenth century, through the first third of the nineteenth century, men engaged in the fur trade passed up and down the Chicago and DesPlaines Rivers in canoes and flat boats very regularly. * * * That the most active trade carried on on the two rivers falls between the period of 1783 and 1825, or there abouts; that the traders found a very easy passageway by means of these rivers in the early spring; that during the time of drought, such as occurred in the summer or fall, the

passage was hard, that even then they forced their boats through the waterway, often being obliged, however, to carry their packages around the shoals and rapids."

Thwaites added to Alvord's conclusion the fact that the carriage varied greatly in length from season to season and from year to year, according to the stage of the water.

McLaughlin's opinion from such of the excerpts as were submitted to him, was that the river was used from the time of Charlevoix to 1825 with "apparently considerable frequency" as a route of trade and commerce, "with considerable ease" at some seasons, and that "it seemed to present some difficulty" at certain seasons. (Abst., 327.)

We submit that the records to which we have heretofore referred do not justify the conclusion that the D. Plaines River was used in the fur trade "very regularly," "quite regularly" or "with apparently considerable frequency" during the period mentioned.

Two experts on historical matters were called by the defendant. Any person who may study their testimony in this case carefully, will be convinced of their ability and equipment for the work.

Dr. Quaife, after the death of Reuben Gold Thwaites, and since the taking of testimony in this case, became Dr. Thwaites' successor as superintendent and secretary of the Wisconsin State Historical Society, a position which he now holds. He edited the four volume Diary of President Polk, wrote a monograph on the "Doctrine of Nonintervention of Slavery in the Territories," contributed articles to the Cyclopedia of American Government, edited by Professor McLaughlin and Albert Bushnell Hart, and at the time of testifying, and for several months prior thereto, had been engaged in pre-

paring a history of Fort Dearborn and early Chicago, for which the Chicago Historical Society placed at his disposal a large mass of material connected with the early history of Chicago, which had been reserved by it for this work and had not been accessible to scholars generally. In connection with that study he acquired a large knowledge of the early history of Chicago and the surrounding region, and he was familiar with a large majority of the authorities referred to by the Government's witnesses before his attention was called to this case. Since testifying, he has produced the work on which he was then engaged "Chicago and the Old Northwest," which is a standard and authoritative work.

It is unnecessary to burden the court with the details of Dr. Quaife's testimony. He pointed out that certain translations used by Alvord were incorrect, or wholly omitted important passages. He also, in connection with the narratives and publications used by Alvord, pointed out numerous statements contained in them, parts of them vital to the issue, which Alvord had not mentioned. The character of his work was also indicated by his demonstration that Ogden's Letters, to which Dr. Thwaites gave authority by including them in his "Early Western Travels," were almost entirely plagiarisms, and that Ogden never made the journeys he described. These are but instances to show the character of Dr. Quaif's work.

The testimony of Mr. Lee, called by the defendant, was particularly devoted to showing the history of the development of trade and settlement in Chicago and the Illinois country, with a view to demonstrating that those conditions made the conclusions of the Government's expert witnesses impossible of acceptance. Without reference to this case, and before his attention was called to it, he had written a work entitled "Transportation as a

ictor in the Development of Illinois." One of the con-
usions to which he came in that work, was that Chicago
as a stimulus for the development of but a small area of
linois prior to 1850, due to the fact that connections
etween it and the interior were not sufficient to make
evelopment possible. The work treated, among other
hings, of the question of transportation in upper
llinois prior to 1860. All this was done, and his con-
lusions arrived at, without reference to this litigation.
Counsel for the Economy Light & Power Company were
referred to this paper by Dr. Jameson, head of the Edu-
cational Department of the Carnegie Institute at Wash-
ington, and this resulted in his appearance as a witness
for appellant. (Abst., 1090-1093.) Mr. Lee furnished
much evidence as to the course and amount of the fur
trade, and the conditions as to population and trade
during the periods in question.

There was introduced a mass of publications, gazeteers and compilations intended to show that the Chicago, DesPlaines and Illinois constitute a route of travel. They have to do with primitive times, and for the most part were demonstrated to have been written by persons who were never in the vicinity of the river. Statements by such persons were copied by other writers and these latter were introduced as though they were original sources. The most that can be said for this class of evidence is that it shows that in early days there was a Lake Michigan-Illinois River route, of which at times of flood, and under precarious conditions, parts of the DesPlaines were at times used by small boats in presettlement days, but none showed it to be navigable for purpose of useful commerce.

Point XVIII.

THE EFFECT OF THE DECISION THAT THE DESPLAINES RIVER IS NAVIGABLE IS NOT CONFINED TO APPELLANT. IF AFFIRMED IT WILL NOT ONLY SERIOUSLY AFFECT VAST PRIVATE INTERESTS, BUT THE RIGHT TO MAINTAIN VERY IMPORTANT EXISTING STRUCTURES, NECESSARY FOR THE CONVENIENCE OF THE PUBLIC.

It is proper to call the court's attention to the far-reaching consequences which must logically follow from the decision of lower courts, if they shall be affirmed. The effect of the judgment appealed from will not be merely that the Economy Light & Power Company may not complete its dam at Dresden Heights. If the Des Plaines is a navigable stream, then the United States has the power to, and if it ever improves the river it must, cause the destruction or modification of thirteen permanent steel bridges between Lockport and the mouth of the river, some of which are the important highway bridges between different parts of Joliet, and two of which are great railroad bridges, all without compensation to the owners, and all to the great inconvenience of the public. It will also have the power to cause the removal of a costly power dam at Joliet, belonging to the State. No permit of the United States was ever asked or obtained for any of these structures. The history of the river justified the builders of them in believing that they had as unqualified a right to build in the bed of this stream as they would have had on any upland held in fee, respecting only the rights of other owners above and below them. This is true, (1) because not only was there no commerce on the river, but there had never been any upon it from the time of the earliest settlement upon its banks, and (2) because the United States had from the earliest days officially classified it as an unnavigable stream. In this proceeding there is, therefore, involved the right

of the United States to require the removal of all structures by riparian owners, by municipalities and by the State, all of which were permitted to be built by the United States, upon an accepted classification of the river, which has been rejected by the lower courts. And this not in the interest of navigation, for restraining the erection of this dam would have no effect on navigation. The existing obstructions absolutely preclude the possibility of such navigation, even if the stream were otherwise capable of it, which it is not.

Conclusion.

Regardless of the ultimate result of this litigation, a great and irrecoverable loss has been sustained by appellant because of the actions brought against it by the State and the United States. It has not only lost the use of its investment, but also the profit which would have arisen from the production of power. But the loss is not alone appellant's. For more than ten years, because of this litigation, power of great value to the public, has literally gone to waste. The work which it would have done, has been done by the needless use of coal and other fuel supplies. And while this waste has been going on, expert witnesses have been solemnly engaged for months in preparing figures, maps and other testimony to establish theoretically by laboratory methods, that a stream whose low water discharge "could be taken through a six-inch pipe," was a navigable waterway of the United States. Possibly the most exhaustive study ever given to historical sources concerning any one small field, has been devoted to an effort to prove, by historical experts, that more than a century ago adventurers and explorers somehow managed to get from Chicago to the Illinois River, and that at times when for brief periods in spring and fall, the DesPlaines River was swollen out

of its banks, they were able, with their canoes, to make some precarious use of the DesPlaines River. And while the engineers figured, and the historians drew deductions, the river rushed on, unnavigated and unnavigable. If the decision below is affirmed, the waste and loss of the last ten years will continue indefinitely. Judging the future by the past, and giving just weight to existing conditions, it is probable that the communities which could be served by this power, will, in the language of the court in *Valentine* v. *Berrien Springs Water Co., supra,* "lose the greatest benefits which nature has placed within their reach," for years to come, if not for all time, because of a decree which protects no interest, and benefits no one. If the river ever is made capable of navigation appellant's dam, according to the War Department engineers, will be an aid, and not a hindrance, to the enterprise.

We submit that in the light of this record, the decree should be reversed.

Respectfully submitted,

FRANK H. SCOTT,
Attorney for Appellant.

In the Supreme Court of the United States.

OCTOBER TERM, 1920.

ECONOMY LIGHT & POWER COMPANY, appellant, v. THE UNITED STATES OF AMERICA. } No. 104.

APPEAL FROM THE UNITED STATES CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT.

BRIEF FOR THE UNITED STATES.

This is an appeal from the judgment of the Circuit Court of Appeals for the Seventh Circuit affirming a decree enjoining appellant from continuing the construction of a dam in and across the Desplaines River at Dresden Heights at a point just north of where it joins the Kankakee River, forming the Illinois River.

STATUTE INVOLVED.

The bill was filed upon the ground that the dam was in a navigable river of the United States and was being constructed without compliance with

section 9 of the river and harbor act of March 3, 1899 (30 Stat. c. 425, pp. 1121, 1151), which is as follows:

> That it shall not be lawful to construct or commence the construction of any bridge, dam, dike, or causeway over or in any port, roadstead, haven, harbor, canal, navigable river, or other navigable water of the United States until the consent of Congress to the building of such structures shall have been obtained and until the plans for the same shall have been submitted to and approved by the Chief of Engineers and by the Secretary of War: *Provided*, That such structures may be built under authority of the legislature of a State across rivers and other waterways the navigable portions of which lie wholly within the limits of a single State, provided the location and plans thereof are submitted to and approved by the Chief of Engineers and by the Secretary of War before construction is commenced: *And provided further*, That when plans for any bridge or other structure have been approved by the Chief of Engineers and by the Secretary of War, it shall not be lawful to deviate from such plans either before or after completion of the structure unless the modification of said plans has previously been submitted to and received the approval of the Chief of Engineers and of the Secretary of War.

RULINGS OF THE COURT BELOW.

Both the District Court and the Circuit Court of Appeals concurred in finding that the river in question was a navigable river, and the injunction was granted upon this ground.

The Government does not contend that either at the time the suit was brought or at the time the building of the dam was commenced the river was actually being used for navigation. The contention, however, is that it was and is a river of navigable capacity, and in connection with other navigable waters constitutes a highway of interstate commerce, and was therefore within the jurisdiction of Congress. It had in the early history of the country been used for such navigation as was, at that time, common upon rivers. On account of changes in the means of transportation, and for other reasons that will appear later, the actual use of the river for this purpose had for the time being ceased. The Court of Appeals, in its opinion, sums up the matter thus:

> From the latter part of the seventeenth century through the first third of the nineteenth century men engaged in the fur trade passed up and down the Chicago and Desplaines Rivers in canoes and flat boats very regularly. Fourteen specific instances of the use of the Desplaines down to the year 1830 are shown in the evidence, as follows: Trips to Chicago: Joliet and Marquette, 1673; Perrault, 1783; Joutel, 1688;

Hubbard, 1819; Ebenezer Child, 1821; Tonty, 1680; La Salle, 1681; Fonda, 1825. Trips from Chicago: Father Membre, 1682; St. Cosme, 1698; Hubbard, 1818; Marquette, 1674; Howard, 1790; Furman, 1830. Very many other trips made during the same period, not so well authenticated, are disclosed in the evidence, and numerous historical references to the Chicago-Illinois route. No doubt other instances of its use may properly be inferred. It was employed by the American Fur Company down to 1825, and then abandoned for other routes. The trial judge found, as the record shows, that there is no evidence of actual navigation within the memory of living men, and therefore there would be no present interference with navigation by the building of the proposed dam. But it was held that the evidence shows the Desplaines a navigable water of the United States, preserved as such by the legislation of Congress.

In the early days the fur trade was a leading branch of commerce in the western world, and this trade was one of the characteristics of the Desplaines River. Large quantities of supplies of various kinds needed by the settlers in a new country were also transported over the Desplaines during the same period in boats of the size and character then commonly used in river commerce, this transportation being carried on between Chicago, St. Louis, and other points. Canoes of several tons burden were used; some were 35 feet long by 6 feet

wide, some 33 feet long by 4½ feet wide, worked by paddles and occasionally a sail, and had a crew of eight men, carrying as much as 6,000 pounds of freight as well as 1,000 pounds of provisions. The pirogues were manned by six or seven oars; the batteaux were larger than the pirogues; the Durham boats were heavy freight craft, 60 feet long, 8 feet wide, 2 feet deep, with a capacity of 15 tons, drawing 20 inches of water.

Commerce of this character existed until about the year 1825. After that year the fur trade having receded to interior portions of Illinois was reached more generally by horses. After the year 1848, when the Illinois and Michigan Canal was constructed, commerce that had formerly been carried on the Desplaines River was carried on the canal. Radical changes had taken place in the condition of the river as heretofore shown, which resulted in a diminution of the flow in the river, and this was one of the causes for the nonuse of the river. (256 Fed. Rep., p. 797.)

The court then stated that, beginning with the year 1835, several dams had been constructed across this river, which, of course, obstructed the commerce that had been formerly carried on, but that, prior to 1889, all of them had been abandoned except one, which was the State Dam No. 1 at Joliet. Upon these findings of fact the court held that the Desplaines River was "a navigable

stream of the United States, or one capable of bearing interstate commerce via the Illinois and Mississippi, at the time of the passage of the acts of 1890 and 1899."

STATEMENT OF FACTS.

As the pivotal point involved in this case is the navigability of the Desplaines River, some salient facts may be referred to here before any attempt is made to review the evidence.

A statement of the physical characteristics of the river will appear later, but here it may be noted that the U. S. Government caused a meander survey to be made of the river in 1821; a certified copy of the U. S. surveyor's notes in evidence (R. pp. 2301-2344) refers to the point on the river where it connects with Portage Lake as "head of navigation." Portage Lake was the connecting link between the Chicago River and the Desplaines, at times with and at times without portages. Here we only pause to note that this commerce was referred to by R. Graham and Joseph Philips in a report dated April 4th, 1819, to the Honorable J. C. Calhoun, Secretary of War, which, in referring to the Chicago River, the Desplaines, and Portage Lake, says: "Between the heads of these two arms" (Chicago River and Portage Lake) "is also a gutter which is dry in the dry seasons of summer and fall and full of water in the spring, and when thus filled with water the

boats of 6 or 8 tons engaged in the Mackinaw and Mississippi trade run through backwards and forwards so as to make no portage between Mackinaw and the Mississippi River." *At the time he made this report Joseph Philips was Chief Justice of the Illinois Supreme Court.*

The character and extent of the actual navigation being carried on at the time of the survey by the American Fur Company with brigade of 12 and 13 boats navigating from Mackinac Island to points along the Illinois River over the Chicago, Desplaines, Illinois route will appear in its proper order.

Counsel for appellant stresses his claim that there is no evidence of navigation of the Desplaines by living witnesses.

The evidence discloses that from 1848 the Desplaines was paralleled by the Illinois and Michigan Canal, giving an obviously superior means of navigation. Appellant's brief, page 16, calls attention to the existence of a dam in 1826 at the site of the proposed dam, and the map attached to it also shows three dams erected in 1833, one in 1835, two in 1839, one in 1841, and one in 1846, and it is also in evidence that the constuction of the Illinois-Michigan Canal was begun in 1836. (R. 772.) The obstructions noted prevented practical navigation of the Desplaines subsequent to 1833, which was therefore 77 years prior to the taking of testimony in this case, and this fact made the possibility

of any evidence of practical navigation of the river within " living memory " exceedingly remote, although one witness (Reed), 86 years of age when the testimony was taken in this case, did testify as to such use, apparently in 1831. (R. Vol. III, p. 2102.)

Counsel attempts to say that the War Department " assured appellant's predecessor that the Desplaines River was not a navigable stream." While this is not material to the issue, we here place before the court the facts showing that no such assurance was ever given or asked or considered for a moment.

In the first place, attention is again called to the reports of Long and Graham and Philips, showing actual contemporaneous navigation in 1819.

In 1867 the War Department caused a survey of the Illinois River to be made under Major General J. H. Wilson, whose first report is dated May 13th of that year. The work contains a survey with plans and estimates of costs for a navigable waterway 14 feet deep from Lockport, Illinois, by way of the Desplaines and Illinois Rivers to the mouth of said Illinois River. The report recommends the use of the Desplaines River from the head of Lake Joliet to the mouth of the river, and says, " It must be remembered that this river is not the exclusive property of those living on its banks. It forms already an important link in a network of river navigation extending with its

arious branches through seventeen States of the Union." (R. 652.)

The report of Assistant Engineer F. C. Doran, January 9th, 1875, also recommends the improvement of the river from Joliet to La Salle; likewise Major Benyaurd's report, dated September 2, 1882, the Comstock Board of Engineers, January 10th, 1887; the report of Captain W. L. Marshall, February 28th, 1890; and the report of the Ernst Board, December 12th, 1905. An act of Congress approved June 13th, 1902, contained an appropriation for "making surveys * * * as may be required to determine the feasibility of * * * and to prepare estimates of the cost of a navigable waterway 14 feet in depth from Lockport, Illinois, by way of Desplaines and Illinois Rivers to the mouth of said rivers." * * * (R. 654–8.)

These references are here made for the purpose of showing that the actual navigation and navigability of the Desplaines River was recognized by the Government in an official report as early as 1819 and that the General Government has had in contemplation the improvement of the river for purposes of navigation since 1867.

It was in the light of the information afforded by the Chief of Engineers of the War Department in 1867 and 1887 that the Illinois Legislature in 1889 undertook the construction of a Sanitary and Ship Canal designed to create a deep waterway from Lake Michigan to the Mississippi River. The Illi-

nois Legislature concurrently, with the passage of the act of 1889, providing for the construction of the canal passed a joint resolution in which it stated that it was the policy of the State to procure construction of a waterway of the greatest practical depth and usefulness and for navigation from Lake Michigan via the Desplaines and Illinois Rivers to the Mississippi River, and requested the United States to aid in the construction of a channel not less than 160 feet wide and 22 feet deep with such a grade as to give a velocity of 3 miles per hour from Lake Michigan at Chicago to Lake Joliet, a pool of the Desplaines River immediately below Joliet, and to project a channel of similar capacity of not less than 14 feet deep from Lake Joliet to La Salle. (R. 2392; Ill. Session Laws 1889, p. 376.)

Thereupon the State of Illinois constructed the Sanitary and Ship Canal from the mouth of the Chicago River to Dam No. 1 in Joliet where it emptied into the Desplaines River and made a junction with the Desplaines and the Illinois and Michigan Canal. The waters of Lake Michigan were turned into the Desplaines January 17th, 1900, thereby adding to the Desplaines a flow of 300,000 cubic feet per minute. That it was the policy of the State to develop the water power created is shown by sections 5 and 6 of the act of May 14, 1903, empowering the Sanitary District to develop, use, and sell the water power created above the upper basin of the Illinois and Michigan Canal; the water

power at Joliet being already developed by State Dam No. 1.

There had been, counsel for appellant says, a dam near the confluence of the Desplaines and Kankakee as early as 1826, but had long since been abandoned, as had all the other dams on the Desplaines except State Dam No. 1 at Joliet. Obviously, the water power capable of being developed on the site of the old dam was, prior to the turning in of the waters of Lake Michigan through the Sanitary and Ship Canal, of no importance. The addition of the waters of Lake Michigan, however, create a water power of vast potential value.

There was, moreover, no riparian right in the owners of the land on the left bank of the stream at Dresden Heights (the site of the proposed structure) to dam the stream, for the reason that the Desplaines River was, in a state of nature, a navigable stream and for the further reason that the right bank of the stream was the property of the Illinois and Michigan Canal commissioners, a part of the Illinois State government.

Some circumstances not disclosed by this record brought the value of the water power in question to the attention of Charles A. Munroe, president of the appellant company, and after the waters of Lake Michigan were turned into the Desplaines he evolved a plan to get possession of both sides of the Desplaines River and exploit the water

power created by the expenditure of about $63,000,000 of public money. His first step, taken in the early part of or some time immediately prior to 1904, was to get control of the lands on the left bank of the river belonging to one Griswold, and to obtain flowage rights in some 1,800 acres of the land on the same side. He did not, however, take title to the land at that time, but while Griswold still remained the apparent owner Munroe approached the Illinois and Michigan Canal commissioners for the purpose of obtaining the right to attach a dam to the right bank of the river and to obtain certain other rights.

In a contract dated September 2nd, 1904, the Illinois and Michigan commissioners for the sum of $2,200 gave Griswold the right to construct a dam or other works across the Desplaines or Illinois River, to excavate and deepen the channel, and to flow the 90-foot reserve strip along the bank of the Illinois and Michigan Canal, provided the towpath was not flooded, and to attach the dam to the right bank of the river and left bank of the canal. Certain other rights were given Griswold and he was given permission to use the gravel or other material along the Illinois and Michigan Canal, the property of the State of Illinois, to raise the towpath bank. (Defendant's answer, Exhibit A.)

An indenture of the same date leased a 90-foot strip to Griswold for 20 years for $500 for the entire term. (Defendant's answer, Exhibit B.)

By a third agreement Griswold was given the right to divert the waters of the Kankakee River into the Desplaines through the Kankakee feeder for 20 years for the sum of $150 a year, with right to grantee to cancel any time after five years. (Defendant's Exhibit C.)

In both leases the lessee was given the right of renewal at the expiration of 20 years.

It was through these frugal arrangements that Mr. Munroe claims to have obtained from the State whatever rights it might have in connection with the development of water power at Dresden Heights which had resulted from the expenditure of so many millions of dollars raised by public taxation for the dual purpose of conserving the public health and completing a deep waterway connection between the Lakes and the Gulf of Mexico.

Only one obstacle now stood in the way of his success; that was the navigability of the Desplaines River. The record discloses that Mr. Munroe was a lawyer, and very obviously he would not proceed in the matter without some investigation in regard to his right to put a dam in the river.

At the very threshold of this investigation lay *The Montello,* 20 Wallace 430, in which the control of Congress over public waters was discussed, navigability defined, and the Chicago-Desplaines-Illinois route was stated to be one of the three

great avenues from the St. Lawrence to the Mississippi which were declared to be within the protective terms of the ordinance of 1787. The court had further said, "And independently of the ordinance of 1787 declaring 'navigable waters' leading into the Mississippi and St. Lawrence to be ' common highway ' the true test of the navigability of the stream does not depend on the mode by which commerce is or may be conducted nor the difficulties attending navigation."

No investigation of the legal status of the matter could be entered upon without having it instantly apparent that the Desplaines was in law a navigable stream subject to the jurisdiction of Congress and that no obstruction could be placed in it without the consent of Congress or the legislature and the approval of the plans by the Secretary of War and the Chief of Engineers.

It was in such circumstances that Mr. Munroe approached the local Government engineer at Chicago to obtain some means of bridging the difficulty.

He did not, however, ask the engineer or the War Department for an opinion as to whether the Desplaines River was navigable and within the jurisdiction of Congress, but he and those with him insisted at all times that it was not navigable (R. 2871, 2108–2124, 1934–1938); that they were not seeking a permit and all that they wanted was some assurance that in the view of the War De-

partment their project would not conflict with the plans of the Ernest Board. By this means they attempted to persuade the War Department to enter into some sort of a bargain whereby if they did certain things the Government would "waive any and all objection which it may have to the progress of such water power construction" as proposed in Munroe's letter of March 20, 1906, and its inclosure (*which are not in evidence*). In the letter he stated that "the agents of the water power company in question informally claim to have secured possession of all the land on each bank of the river necessary to allow for the construction of the dam and of its accessories * * * *and they likewise claim that there is no existing State law or United States law which prohibits their legally going ahead with their construction, and that no special law is needed therefor.*" (R. 2872.) Col. Bixby, the local engineer, in his letter dated March 27, 1906, does not attempt to pass upon the question of navigability and deals with the question upon the representation of the water power company that it is not navigable. He recommends "that the Honorable H. M. Snapp and Mr. Charles A. Munroe be informed that the War Department will waive any and all objections which it may have to the progress of such water power dam construction as proposed by Mr. Munroe's letter of March 20, 1906, and its inclosures, provided that he on the part of the power dam owners agrees, etc."

This, however, Robert Shaw Oliver, Assistant Secretary of War, in a letter to Mr. Munroe, dated June 7, 1906, declined to do. He referred to the conditions which Mr. Munroe and his associates were willing to comply with and merely said that if they were complied with they would be "in general harmony with the work of improvement recommended by the board of engineers appointed under authority of the river and harbor act, June 13, 1902, etc., * * * inasmuch, however, as Congress has not yet authorized the improvement of this river, this department does not deem it expendient to take further and definite action in the matter of approving the plans." (R. 2875.)

February 23, 1907, Mr. Isham Randolph, apparently chairman of the Internal Improvement Commission of Illinois, appointed "to investigate the various problems associated with a projected deep waterway from Lake Michigan to the Gulf of Mexico," called on the Secretary with a letter from the governor of Illinois. He represented that the work of the Sanitary District made possible the development of important water power on the Desplaines and Illinois Rivers. The account of this proceeding, which is very meager and begins on page 1935 of the abstract, states that the honorable H. M. Snapp, Mr. J. W. Woermann, and Charles A. Munroe represented the Economy Light & Power Company; Mr. I. Randolph represented the State of Illinois; and Alexander McKenzie, Chief of Engineers, was also present. Mr. Snapp

instantly stated, in reply to Mr. Randolph, that as the General Government had no right either to this property or the water power developed thereby, there could be no determination of the matter by any of the officers of the Government; that as a matter of fact all the property interest in the Desplaines Valley belonged to private individuals. "The stream is not a navigable stream. It is not a navigable stream either in law or in fact."

> Secretary TAFT. How do we get any jurisdiction of it, General McKenzie?
>
> Mr. SNAPP. Let me answer, Mr. Secretary, as a lawyer you undoubtedly have none, and I was going to bring to the attention of the Secretary——
>
> Secretary TAFT. Why do you come here for a permit?

Mr. Snapp then explains they did not come for a permit, but for advice, to be more safe to proceed. Mr. Randolph states that the river is meandered by the surveys and thinks that might make it navigable. Secretary Taft answers that has nothing to do with determining whether the river is navigable. Mr. Taft then says the application—"and it is rather informal than otherwise—is for this department to take no official action which may interfere with the State control of the water power which may be developed in the Desplaines River, etc. * * * The department is not going to take any action and has not taken any action. The advisory step taken at the in-

stance of Mr. Snapp or the persons who intended to put some sort of water-power construction in the Desplaines River was extra official and really was beyond the authority of the Chief of Engineers except as he was accommodating to express an opinion in the interest of explanation. * * * It has merely offered a friendly suggestion with reference to a possible improvement of the river which has not been authorized and which until it is authorized can not be regarded as giving any right to this Government to interfere in the use of the stream. The proposed action of the private owners here would not be in conflict with such a plan. That is an expression of an opinion with reference to existing plans, but not with respect to existing conditions. Therefore, what General McKenzie has done out of the kindness of his heart does not commit this department to any assertion of authority in the matter * * *. It is not that we approve this—it is not that we disapprove it. It is that we have nothing whatever to do with it."

From the above it is seen that the Secretary and the Engineer did not inform appellant that the stream was not navigable, but appellant informed them in regard to the matter. It did not go to the department for light on that question; it insisted that it knew that the stream was not navigable and that it sought no permission from the Government. When inquiry was made by the Illinois attorney general, October 21, 1907, Acting Secretary of

War Shaw replied, October 28, 1907, that "the Desplaines and Illinois Rivers * * * are considered by the War Department to be navigable streams. There appears to be no record in the War Department of any action relating to the Economy Light and Power Co." (R., 2123.)

Gen. McKenzie testifying, says, at page 2117: "As I recollect that matter, the Secretary in his finding, which was an impromptu matter, made a reference to the fact of nonnavigability, but that was based principally on the presentation made by Mr. Snapp, and the fact that the Secretary did not have to decide whether it was navigable or not; that was not a part of the decision." He says, again, at page 2119: "The statements with regard to the navigability of the river and the connection of the Government with it were made by Congressman Snapp."

It is to be noted that the representatives of the Power Company, after they began their conversations with the local Chicago office, Mr. Woermann, and the local engineer expressly states in his letter to the Chief of Engineers that he talked the matter over "at intervals with Mr. Woermann while he was assistant engineer in local charge of the Illinois River survey under this office before he had been employed by Mr. Munroe, as well as since that time."

The Government considers the correspondence between the local engineer and the Assistant Sec-

retary of War with the representatives of the Economy Light & Power Company and the discussion in Secretary Taft's office in no way material to any issue in this case, but as the matter is presented in appellant's brief in such a way as to impugn the motives of Mr. Wickersham and those responsible for the institution of the suit, we feel constrained to lay the whole matter before the court before discussing that evidence material to the issues in the case.

DESCRIPTION AND HISTORY OF THE DESPLAINES RIVER.

We can not better describe the Desplaines River and recite the essential points in its history than by quoting from the opinion of the Circuit Court of Appeals, in addition to what has already been quoted, the following:

> *The Desplaines up to 1894.*—The Chicago-Desplaines-Illinois water route, used from 1673 to 1825 by explorers and in the fur trade, was made up of portions of the Chicago and Desplaines Rivers, now some eight miles apart. It includes the Chicago River from its mouth on Lake Michigan to Robey Street, Chicago, on the west fork of the south branch, thence westerly, by water or portage, to Mud Lake, about two miles, thence to the Desplaines near Riverside, two miles, down the river to the Illinois, made by the confluence of the Desplaines and Kankakee. The part of this route between the Chicago and Desplaines is called the

Chicago divide. The Desplaines River rises near the county line between Racine and Kenosha Counties, Wisconsin, and runs in a southerly direction, parallel substantially to the west shore of Lake Michigan, through Lake and Cook Counties, Illinois, until it reaches Riverside, some 11 miles from the mouth of the Chicago River; thence it takes a southwesterly direction through Cook and Will Counties to its confluence with the Kankakee River near the east line of Grundy County. The original area of the Desplaines River Basin was 1,428 square miles, and with the changes which have been made the present area is taken at 1,392 square miles. The Desplaines River Basin is usually divided into the Upper Desplaines and the Lower Desplaines, the term Upper Desplaines applying to that portion above Riverside. The Upper Desplaines Basin has an area of 633 square miles, a general length of about 60 miles and a general width of about 10 miles, and is a true basin; has practically no true tributary basins, except Salt Creek, which has about 110 miles, entering at Riverside. It is a rolling country, originally covered with one-half to one-third in timber. Its general declivity by its flood plane is about one and a half feet per mile. The river bed is cut as a groove in a prairie, rather than the ordinary river bed, with an overflow or flood plane on either side. Originally it had a considerable quantity of swamp, marsh, and bog at headwaters; and in Lake County

and in portions of Cook County and also upon Salt Creek in Du Page County; and a lake development in Lake County from which that county derives its name.

The characteristics of the Lower Desplaines Basin, that portion below Lyons or Riverside, are that it covers by the general course of the valley about 42 miles to the confluence with the Kankakee, and has a total descent of about 102 or 103 feet. It has a true sub-basin in the Du Page River which covers 366 square miles. The total area is 795 square miles below Riverside, but outside of the Du Page River this area is only 429 miles. The valley in itself is not a characteristic valley like the Upper Desplaines, but has the appearance of being an old water course or outlet from the Great Lakes in which the modern stream follows through remnants of an ancient stream of much greater magnitude, a succession of pools and wide expanses with intermediate channels, which have not yet developed to their proper proportions, connecting these pools and water stretches. The river valley or river has two considerable tributaries aside from the Du Page, in Hickory Creek and Jackson Creek, but otherwise the drainage is essentially marginal or shore drainage.

Beginning within a mile of the township line between Riverside and Lyons is a long level expanse known as the twelve-mile level, consisting of a succession of water expanses and connecting straits or

channels from 150 feet up to a quarter or an eighth of a mile in width, in places, and with varying depths up to 10 or 15 feet in localities; these water expanses having a mud bottom which seem to be more vegetable deposits than alluvial, and which indicate originally much greater depth; and margined in by a vegetable growth. These expanses were for a long time used as ice fields by the ice interests which had their market in Chicago. Below the twelve-mile level is a succession of ponds and shallow connections in the rock, like Goose Lake and Round Lake, and others between Romeo and the twelve-mile level. This whole stretch is well described in the original land survey as a succession of swamps, ponds, lakes, and marshes connected by currents.

Below Romeo, which is 6 miles below Lyons, there is a declivity at the rate of 7 feet per mile from the Romeo highway down to the head of Lake Joliet, a distance of 11 miles, pretty uniformily distributed. Thence for a distance of about 13 miles between that and the mouth of the river there are some 10 miles occupied by pools, or Lake Joliet, which has a length of nearly 6 miles and has a width of 500 to 900 feet, and a depth originally up to 15 or 20 feet; and then a pool of over a mile in length immediately below Treats Island rapids; then Lake Du Page, some 13 miles in length, with a width of about 350 feet on the average, and with a depth of 10 feet and up-

wards, these pools being connected by intermediate rapids like the one at Treats Island and the one near the mouth of the Kankakee, and the reach of swifter and shallower water between the pool below Treats Island and the head of Lake Du Page. These distances are given only approximately, and to show some of the characteristics of the stream. This description applies to the the Desplaines River as it was known up to about 1894, when the Sanitary District works changed the conditions very radically through the valley above the city of Joliet, between there and Lyons or Riverside. The proportion of the Desplaines River itself from the end of the portage road to its mouth, or confluence with the Kankakee, that would consist of pools, would be about 60 per cent. The total distance from the portage road to the confluence with the Kankakee is about 44.5 miles. In that distance there would be the so-called 12-mile level, which is 13.7 miles, Lake Joliet, the pool below Treats Island, and Lake Du Page, aggregating 10 miles, and Goose Lake and Round Lake, and some other stretches unnamed, amounting in all to about 27 or 28 miles out of a total of 44.5. The distance from Dam No. 1 to the mouth of the river is 15.72 miles, of which about 10 miles consists of pools. This stretch is now more particularly in question. The condition of these pools if the Desplaines River were to run dry; that is, no water pass from pool to pool, would be that Lake Joliet would be

practically available for boats as before, the depth in it being from 20 to 25 feet at the maximum, and a large proportion of it having more than 10 feet.

The distance from Lake Michigan to the mouth of the Desplaines River is 58.32 miles, made up as follows:

	Miles.
From Lake Michigan to Ashland Avenue, which is substantially at the forks of the south branch of the Chicago River	5.5
Ashland Avenue to Ogden dam, which is across the old portage slough, on the range line, R. 12, 13, north of Summit	8.3
The so-called 12-mile level, actual length	13.7
From 12-mile level to Isle la Cache	6.7
Isle la Cache to Dam No. 1	8.4
Dam No. 1 to head of Lake Joliet	3
Head of Lake Joliet to mouth of Desplaines River	12.72
	58.32

A gauge record kept at Riverside for a period of 20 years from the year 1886 to 1904, both inclusive, showed the water stood at above 18 feet on the Riverside gauge an average of 4.3 days per year; at or above 13.8 feet an average of 47.6 days per year; at or above 13 feet an average of 73.2 days per year; at an elevation of 12.4 feet an average of 116.2 days per year; at or above 11.85 feet an average of 190.65 days per year.

When the water stood at 10.5 at the head of the 12-mile level at Summit, corresponding to 13 feet on the Riverside gauge, and a volume of 600 second-feet, the water in the portage swamp and channels connecting with the Desplaines River would be flowing over to the Chicago River to the

extent of the capacity of the trench that existed below this level. During the 20-year period referred to water would have flowed over the Chicago divide on an average of 73.2 days per year.

At all elevations when the water at Summit stood at 11.73 or above, corresponding to an elevation of 13.8 on the Riverside gauge, and to a volume of 1,052 second-feet, a boat drawing 15 inches of water could pass from the Desplaines River across the Mud Lake region and over the Continental or Chicago Divide and into the Chicago River without making any portage between them. Such condition would have prevailed during the 20-year period an average of 47.6 days per year.

At an elevation between 13.8 feet and 12 feet the water would gradually diminish in depth on the Chicago divide, and when a portage became first necessary it would be about one mile in length, and when it reached the level of 10.5 it would be two miles in length between the west fork at Western Avenue, Chicago, and the beginning of deep water in Mud Lake.

At an elevation between 13 feet and 12.4 feet on the Riverside gauge boats could no longer pass between Mud Lake and the Desplaines River, except light, and be entirely stopped, and a portage of one or two miles would be required between Mud Lake and the Desplaines River, in addition to the portage of two miles between the west fork and Mud Lake. In this condition there

would be a substantial navigable depth of 15 inches between Isle la Cache and Mount Joliet, a distance of 11 miles. Isle la Cache is located in the Desplaines River on the township line between the towns of Du Page and Lockport.

At an elevation between 12.4 feet and 11.85 feet on the Riverside gauge the Chicago divide would require the two portages mentioned, or the alternative of a 7-mile portage between the waters of the Chicago River and the Desplaines. The Desplaines would have a navigable depth of 12 to 15 inches, with possibly some deficiency in one or two localities; from Romeo down to the head of Lake Joliet there would be sufficient water for a boat at the higher stages to go down partially loaded and at the lower stages to go down light, but at the lower stages the cargo itself would require a transfer over the 11 miles from Isle la Cache to Mount Joliet. All the river below Lake Joliet would be navigated by discharging the cargo in part or wholly at Treats Island and near the mouth of the river.

There has been no time when the Desplaines River ran absolutely dry and there was not any water passing from pool to pool except as it was artificially produced by the abstraction of water from the Desplaines either for canal purposes during the time in which the Desplaines was used in that connection as a feeder or through the cutting down of the Chicago divide and the

drainage of the water towards Chicago at medium and low stages.

Changes in Desplaines River.—Various changes have been made in the Desplaines River from its condition as it existed in a state of nature. The portage swamp region lying east of the range line at Summit has been drained and made tributary to the Chicago River, except so much as is tributary to the canal, this area amounting to 48 square miles. There has been added from the Sag region an area of about 12 square miles, making the change below Lemont, 36 square miles to be deducted from the former areas. The deficiency of rainfall averaging 2.9 inches per year during the period of 20 years from 1887 to 1910, computed from the Riverside gauge, would produce a deficiency in run-off of probably 15 or 20 per cent, and the effect of that would be to diminish both the volume and duration for the stages of water exhibited in the table referred to. There is also a deficiency in the run-off due to the substantial clearing away of the forest-covered area of 5 per cent. There are changes which have affected the distribution of the run-off. The clearing away of the forests has destroyed an element of control which has diminished the control and the duration of the stages of water, and in addition the restriction of ponds and lakes and the drainage of wet lands, bogs, and marshes, and particularly the destruction of a special control existing in the portage swamp region and

12-mile level, all of which under natural conditions prolong the stages of water.

There have been radical changes in reference to the depletion of the water in the Desplaines River from a state of nature. The first change of significance was due to the construction of the Illinois and Michigan Canal in 1848. The effect of the construction of that canal upon the water in the lower Desplaines was a reduction of the drainage of the river below the dams at Joliet to less than 250 square miles out of a total of 1,428 square miles. Further interference arose from the fact that the location of the canal along the south and east side of the valley caused the hill drainage to be turned in part toward Chicago, and on the tangent between Summit and Bridgeport (in the southwestern part of Chicago) it ran across the south arm of Mud Lake, cutting off the drainage and reservoir control of that portion of the portage swamp region lying to the south of the canal. From 1866 to 1871 the Illinois and Michigan Canal was deepened, causing interference with the flow of the river. Further interference was caused by the construction of ditches in the Mud Lake region, and by the erection of pumping works at Bridgeport in 1883. Interference also occurred by reason of the construction of the river diversion by the Sanitary District in 1893–4, by which the Desplaines River was shifted to the west and north side of the

valley so as to leave a site between the river as thus changed and the Illinois and Michigan Canal for the construction of the drainage canal itself. Interference has also been caused by inhabitation which has cut away forests, thus curtailing the run-off, and there has been drainage of swamps and wet lands, and the destruction of ponds and lakes. The Sanitary and Ship Canal, which was completed in 1892, joins the Desplaines at Dam No. 1, 31.6 miles from Riverside, from which point its waters flow into and increase the current of the Desplaines.

These various changes have materially interfered with the flow of the river, and the conditions in the basin itself have been changed by the actual distribution of the flow. The Desplaines River has an impermeable soil bottom, and the control that was exercised was surface control largely. The destruction of this surface control has affected the flow of the water much more radically than would have been the case had the ground been permeable.

NAVIGATION OF THE DESPLAINES.

The United States District Court in its memorandum opinion found as follows with reference to this point:

> United States claims among other uses actual navigation from early fur-trading days down to end of first quarter of last century.

> Proof of actual specific use by customary mode of trade and travel by water—that is, by kind of craft then used for that purpose in rivers of United States—throughout this period appears. Controversy here has really been as to extent rather than the fact of such use. This evidence taken with existence of portage from Chicago River to Desplaines during time mentioned and large collection of historical documents, contemporaneous maps, and historical records and reports forbids conclusion river was not subjected to such use for trade and travel down to and subsequent to enactment of congressional legislation referred to. From this follows river shown by evidence to be navigable water of United States when bill filed and at present time. (R. 3236.)

The judgment of the court of appeals sustaining these findings by the district court can not be overturned unless shown to be clearly contrary to the weight of the evidence.

The Government feels that it has a right to rest upon these conclusions and this concurrence of opinion which is so amply supported by the evidence appearing in a somewhat condensed form in the 3,000 printed pages contained in the three volumes of Abstract of Proofs now before the court and the 50 or more maps also appearing in the record, but not otherwise reproduced.

Notwithstanding this, the Government believes that, as counsel for appellant have failed to review the evidence, it should, in view of the importance

of the case, give the court such aid as may come from a brief reference to the principal evidence introduced on both sides.

FORMER LITIGATION BETWEEN APPELLANT AND THE STATE OF ILLINOIS.

Some years ago the State of Illinois brought, in its own courts, a suit against the appellant, in which it sought the same relief which the United States has obtained in this case. In that case, upon the evidence then submitted, the Supreme Court of Illinois held that the Desplaines River was not navigable and hence refused to enjoin the building of the dam (241 Ill. 290). The United States not being a party to that suit is, of course, in no way bound by the judgment. But the evidence in that case was materially different from that in this case. Some of the differences will be noted in the review of the evidence which we will now undertake.

GOVERNMENT'S EVIDENCE.

Professor Clarence W. Alvord, associate professor of history, University of Illinois, special editor publications Illinois State Historical Library, including bulletins entitled "Illinois in the Eighteenth Century," Volume II, Virginia Series, Volume I, Cahokia Records, Volume IV, Illinois Historical Collections, Subtitle Executive Series, Volume I, Governor's Letter Books, "The

French Archives of Illinois," the "Archives in the State Capitol," " The Genesis of the Proclamation of 1763," " The British Ministry and the Treaty of Fort Stanwix," " The Conquest of St. Joseph by the Spanish in 1780," " Capture of Vincennes by George Rogers Clarke in 1788 " and other historical articles and papers, testified for the Government.

All of his courses for the doctor's degree have been in western history. His position had been that of a specialist in Illinois history since 1905. He had made a search of printed materials and had found a quantity in Illinois, in Canada, Boston, Albany, and Philadelphia bearing on early Illinois trade, including the fur trade. (R. 1–3.) Furs constituted one of the most important articles obtained by Europe from North America. One of the principal fur-bearing animals was the beaver, found abundantly around the rivers flowing into the lower part of Lake Michigan (p. 5). The three main periods in the history of the fur trade:

1. 1670 to 1763, largely by the French.

2. 1763 to 1812, by the British, coming down through Canada.

3. 1812 to 1834, aided by statutes, American Fur Company monopolized the trade (p. 6).

He cited numerous historical works, including one by F. J. Turner, which refers to the Chicago-Desplaines-Illinois route.

The American Fur Trade in the Far West, by H. M. Chitterden, in three volumes, who says that the fur trade was a leading branch of commerce in the Western World; that St. Louis was the principal, if not the only emporium, and communication with New York and other seaboard towns took place chiefly by the Ohio or the Great Lakes. "In the latter case the route was sometimes by way of the Illinois River to Lake Michigan." (*Reference to Chittenden not in the State case.*)

Refers to "Travels and Explorations of the Jesuit Missionaries in New France, 1610 to 1791," edited by Reuben Gold Thwaites, secretary of the Historical Society of Wisconsin, volume 59, containing a report by Father Marquette of the first voyage on the Mississippi made by a Frenchman, who said, "We therefore reascended the Mississippi, which gives us much trouble in breasting the current. It is true we leave it about the 38th degree to enter another river, which greatly shortens our road and takes us with but little effort to the Lake of the Illinois."

This trip was made *in the summer of 1673;* and Marquette continues, "In the spring and part of the summer there is only one portage of half a league." (R. 23.) Alvord explains that the Lake of the Illinois was Lake Michigan and the route was via Illinois-Desplaines-Chicago Rivers.

Attention is called to *Joliet's map*, dedicated to Frontenac, appearing as Exhibit 1, showing the *Chicago-Desplaines portage* and the *Chicago-Des-*

plaines-Illinois route. Alvord refers to French work by *Pierre Margry,* many years archivist in Department of Marine established by Colbert. It contains report to Frontenac, governor of New France, to Colbert, mentioning the opinion of Joliet, who accompanied Marquette, to the effect that "*by the route in question one would be able to go easily by ship to Florida by means of a very good waterway; that there would be only one canal to make, and that by cutting through one-half a league of prairie to enter from the lower part of the Lake of Illinois into the River St. Louis.*

Witness then refers to record of trip by Marquette again in *1674. He went in the spring and did not make any portage.*

In 1681 La Salle went up the river in search of Tonty. Margry gives the following account: "He [Tonty] ascended by this river without leaving any sign of his passage. In this he made a great mistake, which gave much trouble to Monsieur La Salle, as we shall see hereafter. He arrived *in a few days* at the Lake of the Illinois, on which he embarked, going from south to north along the western coast of this lake. He experienced incredible difficulties in this lake navigation, since he with all of his company was reduced to extremities from lack of provisions. At length he arrived, however, among the Pottawatomies, where he was compelled to pass the winter." (R. 29–30.)

Margry quotes La Salle's criticism of Joliet's project for a canal connecting the Illinois with

Lake Michigan on account of the difficulties of navigation. (R. 34–35.)

The witness gave it as his opinion that both Joliet and La Salle agreed on the possibility of using the Chicago-Desplaines route for commerce in smaller boats and canoes. Their disagreement was over the feasibility of a short canal and the usefulness of the route for larger boats. He says Joliet was one of the Jesuits who had a monopoly of the fur trade in the Lake region and desired the use of the route in connection with the Lakes. La Salle on the other hand was prejudiced against the Jesuits and had a patent which gave him the privilege of trading in the Illinois country, but forbade him to trade in the region which was already occupied by Canadian traders and from where furs were regularly carried to Montreal and Quebec. (R. 42.) In short, La Salle desired the trade to go down the river, and did not wish anything done to attract the traders from the north.

Government introduced a map by *Father Hennepin,* published in *1683, showing the Chicago-Desplaines-Illinois route and the Chicago-Desplaines portage.*

Hennepin also wrote a description of the Illinois country, using La Salle's narrative freely. Although he prepared the map just noted, Alvord says he never used the Chicago-Desplaines route, his only trip being by St. Joseph-Kankakee port-

age. Joutel's journal of La Salle's last voyage, 1684–1687, shows that La Salle got a French fleet from the King to go up the Mississippi for the purpose of carrying out his idea of making the Mississippi a channel of trade. On the way he was murdered. Joutel became the leader of the party, which then sailed to the Illinois River, where they met Tonty; and the following March the party set out for Chicago, embarking on the river at Fort St. Louis March 21st, *and in spite of the difficulties occasioned by high water, arrived in Chicago March 29th.* (R. 44–45.)

Champigny, intendant of new France, wrote to Louis XIV from Quebec, October 13th, 1697, recalling that Tonty and La Forest have been permitted to keep Fort St. Louis on condition that they would not trade in beaver skins there and saying that they certainly would not stay there except to trade in beaver skins and they would do so at an immense profit; that they had established a *warehouse at Chicago and another at Michilimackinac.*

The witness says that this passage shows that *La Salle's successors* were exploiting the fur trade of the region and *necessarily using the Chicago-Desplaines River route* as a means of communication. (P. 46–48.) Early Voyages Up and Down the Mississippi, by Cavelier, St. Cosme, LeSueur, Gravier, and Guignas, by John Shea, an historian of the Roman Catholics in America, who was al-

lowed to examine the archives of the Roman Catholic bodies in Canada, gives an account of St. Cosme going down the Chicago-Desplaines route. He left Chicago October 29th, 1700, made a portage " which is three leagues when the water is low and only a quarter of a league in the spring " (p. 49).

Volume 65, Jesuit Relations, by Thwaites, contains a letter from Father Gravier which the witness says indicated he *used the Desplaines route September 8, 1700.* In Collections of the State Historical Society of Wisconsin, volume 16, there is a letter from two French officials in New France to the French minister urging the establishment of a post at Chicago " *to facilitate access* to the Illinois-Miami " Indians. A footnote by Professor Thwaites says, " *of the portage here mentioned that of Des Chesnes (the oak trees) was the one from the Chicago River to Desplaines, the earliest and best known route between Lake Michigan and the Mississippi.*" (Pp. 54–55.) (*The foregoing was not in the State case.*)

Chicago Antiquities, Comprising Original Items and Relations, Letters, Extracts, and Notes Pertaining to Early Chicago, Embellished with Views, Portraits, etc., by Henry H. Hulburt, contains a rough draft of a report by *James Logan,* bearing date December, 1718, designed to aid Governor Keith, of Pennsylvania, in preparing his memorial to the British Board of Trade. Logan, who came to America with William Penn on his second visit

as his secretary, filled many offices in the Province, including that of chief justice, president of the council, and governor. The report describes the passage from Lake Huron to Lake Michigan, thence 150 leagues to Fort Miami at Chicago, and continue "*up the River Chicago they sail but three leagues to a portage of a quarter of a league. They then enter a very small lake of about a mile and have another very small portage and again another of two miles to the River of Illinois, thence down the same 130 leagues to the Mississippi.*"

(NOTE.—It seems probable Logan did not personally visit Chicago, but report shows the general knowledge of and the well-known character of the route.) (*The foregoing was not in the State case and is not referred to in appellant's brief.*)

A quotation from *Charlevoix's Journal,* referring to a journey in 1721, says, "*I had two routes to chuse to go to the country of the Illinois. The first by returning to Lake Michigan and entering a little river at Chicago. After ascending five or six leagues up this river, there is a passage to that of the Illinois by two carrying places, the longest of which is not above a league and a quarter.*" (R. 58.) Charlevoix did not use the route, but statement shows it was a well-known route. (*The foregoing not in the State case.*)

"The Contest in America Between Great Britain and France with its Consequences and Importance. By an Impartial Hand. 1757." The author, John Mitchell, British physician, specialist

in botany and cartography, a man of learning and high reputation, says, with reference to the fur trade, "For this they have hitherto been obliged to go to a vast way aroundabout by way of the four Great Lakes and thence down the River Illinois into the Mississippi." *DuPratz* (1774), speaking of a river called the Illinois, says it was by this river that the first travelers came from Canada into the Mississippi. (R. 661.) *Choisseul*, prime minister of France, suggesting terms of peace, says the colonists who trade in peltries in the woods "betake themselves to the southern extremity of Lake Michigan, *whence by means of a very short portage, which one calls the Portage aux Chenes, they descend by the river, the Illinois, into the Mississippi.*"

Letter was written to guide the French agents in negotiations and secure the retention of the exclusive navigation of Lake Michigan and a sure access to the Illinois trading posts. (R. 71.) (*Foregoing not in State case and not referred to in appellant's brief.*)

Work on topography in western country by *Thomas Hutchins*, published in London in *1778*. Hutchins, captain in British Army in the French and Indian War, and a civil engineer employed by the Government to make maps of the West. Map used by later map makers as authority. Following passage appears: "*The Illinois River furnishes a communication with Lake Michigan by the Chi-*

cago River and by two portages between the latter and the Illinois River, the longest of which does not exceed four miles." (R. 72.)

Haldimand papers from Canadian archives at Ottawa. General Haldimand, British officer, governor of Florida and of Canada, 1760–1780. Historians regard the copies as authentic transcripts of the originals. Several passages quoted make references to the Desplaines route, showing it a well-known route and one frequently used for travel. One refers to the danger of Clarke attacking the British *by coming up the Illinois River to Chicago.* (R. 73–74.)

A letter from Lieutenant Governor Sinclair to a British colonel tells of *Canadian and Indian troops using the Illinois River route to go to the Mississippi and returning that way.* (R. 75–76.) Another letter from a British captain gives a plan of attack on the Illinois country by means of barges from Chicago "*where there is a portage of half a league in good weather; in this way we could come without difficulty to the Illinois.*" (*The Haldimand papers were not in the State case and not referred to in appellant's brief.*)

"Archives of aboriginal knowledge, containing all the original papers laid before Congress respecting the history, etc., of the Indian tribes of the United States," 1860, by *Henry R. Schoolcraft,* contains an account by Jean Baptiste Perrault, who in 1783 was apprenticed as a clerk to

Mr. W. Kay, of Montreal. May 16th, 1783, Mon sieur Marchisseaux " directed me to assemble th men whom he had engaged in Montreal for th voyage." They went to LaChien, where th waters from the north delayed them to the 27th They arrived at Mackinac with their two canoe June 28th, remaining there until July 15th. Fron thence they went to Green Bay, thence to Sau Village at Hurkey River. " Monsieur Marchis seaux being necessitated to pass there instead o *the direct route from Mackinac to St. Louis b way of the Illinois* in order to collect his credit from the Indians * * * we left Cahokia o the 4th of May for Mackinac. Directions *were t pass by Chicago,* having one barge and one canoe etc." (R. 78–79.)

" Journal of a voyage made by *Hugh Hewar* to the Illinois Country." Exact copy of origina in Heward's own handwriting tells of a trip fron Chicago to Cahokia by way of the Desplaines i the spring of *1790*, shows it was taken in *pirogue.* Manuscript describes journey from De troit through the Great Lakes down to the south ern end of Lake Michigan, *then by Chicago, th Desplaines to the Illinois, thence down to Caholi in the spring of 1790.* The lake trip was appar ently taken in bad weather. "May 11th, 1790, en gaged five Indians to help us over the carrying place with the pirogue. Got over nearly at mid day. Passed in the run and small lake to th

River DePlain and course running southwest" (p. 82).

"The Life and Public Services of *Arthur St. Clair,*" containing a report of the President in *1790* concerning water routes between Lake Michigan and the Mississippi, by St. Clair, then governor of the Northwest Territory, says: "*Much the greatest part of the merchandise for the trade of the Missouri River is brought from Michilimackinac by that of the Illinois*" and "the furs in which these goods are generally paid for are carried through Canada *by the same communication up the Illinois River to Chicago and thence by a small portage into Lake Michigan.*" It says that in the spring the waters rise so high "*that the intermediate space is overflowed and is passable by vessels in use there which are bark canoes, but which carry a very considerable burden and are navigated by three to five persons.*" (R. 87.)

General *Collot,* Frenchman, *Governor of Guadeloupe,* in connection with a trip through western America in the latter part of the eighteenth century reports that in high water boats carrying *from fifteen thousand to twenty thousand weight can make the passage without portage* by traversing a marsh where there is from four to five feet of water. (R. 88.) (*Not in State case and not listed by appellant.*)

Captain *Imlay,* United States Army, also commissioner for laying out lands in back settlements,

in "A Topographical Description of the Weste
Territory of North America," published in *179*
refers to the Desplaines Route and says it had "
portage of only two miles." (R. 89.)

Robert Dickinson, an Indian trader, wrote Jul
4th, *1793, mentioning the route by Chicago as on*
of two ways of communication between Mackina
and the Mississippi. (R. 90.)

Peace treaty negotiated by General Anthon
Wayne with the Indians in 1795 stipulated tha
the United States was to have a free passag
from "*the mouth of the Chicago to the portag*
between the river and the Illinois, and down th
Illinois River to the Mississippi," (R. 91.) (*Las*
two references not in State case and not referre
to by appellant.)

Thomas Forsyth, an early fur trader, made
memorandum of distances on the Chicago-Des
plaines, Illinois, route in *1814* (R. 95) and i
another letter mentions the route as a possibl
way by which the British and Indians might com
down and attack the Americans (R. 97). (*No*
referred to in State case or in appellant's brief.

Letter from *Governor Cass* to Secretary of Wa
in 1815: "There are three great channels of com
munication by which traders may introduce good
in the Mississippi and Missouri country from th
British dominions. One is by way of Chicag
and down the Illinois." (R. 99.) (*Not in th*
State case and not referred to in appellant'
brief.)

John Kinzie wrote Governor Cass in 1815. Urges building of a military post at Chicago as a navigation of the Illinois and Fox Rivers " will in a few years become an object of great importance to the U. States as *at present boats of several tons burden can pass from Lake Michigan into the Mississippi River.*" (R. 101.) (*Not in State case and not in appellant's brief.*)

Wm. Darby, famous United States surveyor, explored region 1818 and wrote " *No doubt now remains but that the Chicago and Illinois Rivers afford by far the most natural eligible connection between the northern and southern waters of the United States.*" *He refers particularly to the Chicago and Desplaines Rivers.* (R. 105–106.) (*Not in State case nor referred to in appellant's brief.*)

Darby in a footnote printed an editorial from the St. Louis Enquirer by *Thomas A. Benton,* referring to Graham & Phillips, says that the commissioners will run two lines from the southwestern part of Lake Michigan to the Illinois River, embracing the little Rivers Chicago and the Plein at the carrying place between them, which form the channel of communication between Lake Michigan and the Illinois River. "*The French of Canada and of the valley of the Mississippi have communicated through this channel since the settlement of the countries. In high water boats of ten or a dozen tons pass without obstruction. In dry*

Microcard Editions

A Division of Information Handling Services

CARD 42

season they are unloaded, placed on vehicles, and drawn by oxen over a portage of a few miles, and landed into the river or lake, as the course of portage may require. Hundreds, nay thousands of boats have been seen at St. Louis which have made a similar passage. (R. 106.) (*Not in State case or appellant's brief.*)

The report of Graham & Phillips to Secretary of War saying that in the spring "*boats of six or eight tons engaged in the Mackinaw-Mississippi trade run through backwards and forwards so as to make no portage between Mackinaw and the Mississippi.*" (Pp. 114, 115; see also 116.)

They also refer to the route as "the route by the Chicago, as followed by the French since the discovery of the Illinois," and say it "presents at one season of the year an uninterrupted water communication for boats of six and eight tons between the Mississippi and the Michigan Lake, etc."

"A Pedestrious Tour of Four Thousand Miles through the Western States and Territories during the Winter and Spring of 1818, by *Estwick Evans*, Concord, 1819," states, "There is a communication between the Illinois River & Lake Michigan by way of the Chicago River and two portages." (*Not in the State case or referred to in appellant's brief.*)

Gurdon S. Hubbard's Sketch of Life, 1802–86, arranged by a nephew, and a paper read by Hub-

bard himself give information as to use of the route by the American Fur Company.

A list of employees of American Fur Company, 1818, contains the following entry at page 162: "Engaged April 26, 1818. Hubbard, Gurdon S. Time, five years; capacity, clerk; where engaged, Montreal; wages, $120; where employed, Illinois River. Remarks, Illinois River." (R., p. 118.) He tells of his engagement with the fur company, his journey to Mackinac Island, then having a population of 500, principally Canadian, French, and half breeds. "I was detailed to the *Illinois brigade of traders*, under the command of Antoine Des Champs, a highly educated gentleman, who had been more than 40 years an Indian trader on the Mississippi, Illinois, and Ohio Rivers. Our brigade of traders left Mackinac in September, coasting the eastern shore of Lake Michigan to Chicago; there we found Fort Dearborn garrisoned by United States troops. *John Kinzie* and A. Ouilmett were the only white inhabitants at that period in Chicago and northern Illinois." Nothing is here said (Abst. pp. 118–123) about the number of boats in the Illinois brigade, but it appears later from Hubbard's statement (R. 1511) that there were *at least 12*. In connection with Hubbard's return to the Illinois brigade, after his absence of a year and his departure from Mackinac Island (R. 400), he says: "In due course of time our brigade started, *the 12*

boats led by Mr. Des Champs and the old familiar boat song." They arrived in Chicago, where he joined Mr. Kinzie's family, "and remained there for several days *until the brigade again moved for the Illinois River.*"

The number of boats was insufficient to carry all the furs collected at the trading posts, as Hubbard tells us in connection with the winter of 1822 to 1823. "*We had accumulated more furs and peltries than our boats could carry up the Desplaines River, and I was accordingly dispatched with four boat loads to Chicago. These I stored with Mr. John Crafts and returned to the brigade, when we all moved forward to our annual return to Mackinac.* A portion of our furs were shipped from Chicago for the first time in a small schooner, which had brought supplies from the garrison. In 1819 the brigade consisted of 13 boats." (R. 1195.)

Hubbard's description of Mackinac Island in 1818 and the course of the fur trade carried on by the American Fur Company during his connection with it, including the description of the annual trips from Mackinac Island to the Illinois River via Lake Michigan and the Chicago-Desplaines route, are enough in themselves to show that the method of trading had long been established when he joined the company. (R. 123.)

But, in addition, attention is here called to the fact that the American Fur Company, organized

in 1816, was a reorganization or combination of the Mackinac and Northwest Companies organized in about 1784, which apparently followed the General Store organized by a majority of Mackinac merchants in 1779 for mutual protection. These companies traded on the Illinois (R. 1671); and that the regular course of trade was by Lake Michigan and the Chicago route is evidenced by the statement of Hubbard relative to a house located on the Chicago River prior to 1778. "This tradition I received from Messrs. Antoine DesChamps and Antoine Beson, who from about 1778 had passed from Lake Michigan to the Illinois River yearly; they were old men when I first knew them in 1818." (R. 1667.) At that time (1818) Mr. DesChamps, superintendent of the Illinois trading post, had been an Indian trader on the Mississippi, Illinois, and Ohio Rivers for more than 40 years.

These methods continued up to 1825, when Mr. Des Champs, having grown old and worn by long-continued service, resigned his position as superintendent of the Illinois trading post of the American Fur Company, and on his recommnedation Hubbard was appointed to succeed him. "I now determined to carry out a project *which I had long urged upon Mr. DesChamps, but without success.* * * * The goods and furs I proposed to transport from the Indian hunting grounds on pack horses. In this manner the long, tedious, and diffi-

cult passage through Mud Lake into and down the Desplaines River would be avoided and the goods taken directly to the Indians at their hunting ground instead of having to be carried in packs on the backs of men. During the year 1822 I had established a direct path or trace from Iroquois post to Danville and now extending it south from Danville and north to Chicago, thus fully opening Hubbard's trail from Chicago to a point about 150 miles south of Danville." (R. 221.)

(We note here that Mr. DesChamps, with his many years experience still believed that the Chicago-Desplaines route was the best method of reaching the trading posts, although, as the testimony of the historians hereafter referred to will show, the hunting grounds had receded far from the Illinois River, and the quotation itself shows that the merchandise exchanged for the furs had to be carried from the river in packs on the backs of men.) There also appears a statement to a trip taken by Hubbard over the Chicago-Desplaines River route for the purpose of getting supplies.

Hubbard's account shows that in the fall in the dry weather the boats were unloaded and pushed through the ditch on short rollers. Four men only remained in a boat and pushed with poles while six or eight waded in the mud alongside and assisted in that manner. (R. 119.) This gives some indication of the number of men manning each

boat. (*No evidence in regard to Hubbard or the use of the river by the American Fur Company appeared in the State case.*)

The return journey appears to have been made in each case without any portage and sometimes with the use of sails. He says, "*In the spring following we returned by the same route. The rivers being full we had no portage to make passing the ditches and mud lake under full head.*" He refers to the trading posts on the Illinois River as being about 60 or 70 miles apart. (R. 123.) (See also 122.) Page 303, Hubbard says, "*I had before this been told by Mr. DesChamps that he made a trip every fall to St. Louis with one boat to purchase supplies and tobacco and other necessaries for distribution among the various traders on the Illinois River.*"

One of appellant's witnesses also says that in the spring of 1825 Kinzie sent two men in a canoe from Chicago to Peoria. Hubbard, about the same time, went down in another canoe with one companion. They went on to St. Louis, got some goods, and delivered them to Chicago. (R. 1701.)

Henry R. Schoolcraft, historian, says that at the time he visited the Desplaines August 13th, 1821, the water varied in depth from one to two feet, but this was when rivers "are generally at their lowest stages." "*During the spring floods the Desplaines may be estimated to carry a depth of eight or ten feet of water to the junction of the Kankakee.*" (R. 126.) (*Not in the State case.*)

"Recollections of Wisconsin since 1820, by Col. *Ebenezer Child,*" a fur trader from the East, recounts a trip in 1821 to St. Louis returning from St. Louis "by the way of the Illinois River." He could not find a portage, "as it was full of water." (R. 127.) (*Foregoing not in the State case.*)

"*Ogden* Letters," published in *1823, George Ogden,* who went on a business trip to the western country in 1821, says "*The Plein is navigable within 2 miles of the Chicago River and boats are said to have passed loaded from one to the other at high water.* (R. 128.)

Ordinance of 1878 fixed the northern boundary of Illinois at the line west from southern boundary of Lake Michigan. Pope, the Illinois delegate, got this changed so as to have a port on the lake which would tend to bring in the State northern settlers by the northern waterway." This obviously refers to the Chicago-Desplaines. (R. 129.) (*Not in State case and not in appellant's brief.*)

"A Gazetteer of the States of Illinois and Missouri * * * and a particular description of towns, river, etc., by *Lewis C. Beck,* A. M., member of the New York Historical Society and of the New York Lyceum of Natural History. Albany, 1823," referring to the Desplaines River says, "The fact of an easy and during some seasons an *uninterrupted communication between Lake Michigan and the head waters of the Illinois was observed by the French at the first discovery of the*

country; and on this account they immediately erected trading establishments on different parts of the route. (R. 131.) * * * "The information of traders and voyagers was such as *left no doubt of the existence of a natural canal between Lake Michigan and the Illinois at some seasons of the year.* * * * *Except in very dry seasons the portage was seldom more than 3 miles.*" (R. 131–132.)

Narrative of an expedition to the source of St. Peter's River, etc., 1823, by order of the Honorable J. C. Calhoun, Secretary of War under command of Stephen H. Long, compiled by William H. Keating, A. M., professor of minerology and chemistry, University of Pennsylvania, London, 1825, says, with reference to the Chicago-Desplaines, "*Having been informed that this route was frequently traveled* * * * *we determined to ascend the Chicago River* (*135*). * * * *Lieutenant Hopson, who accompanied us to the Desplaines, told us that he traveled it with ease in a boat loaded with lead and flour.*" (R. 136.) (*Foregoing not in the State case.*)

"Early Reminiscences of Wisconsin by John H. *Fonda*" describes *a trip up the Desplaines* with a party and an Indian guide to Chicago where they found Mr. Hubbard. (R. 137.) (*Not in State case.*)

"*Drown's* Record & Historical Review of Peoria, 1850," states that John Hamlin, "who is still

with us," was a clerk in the American Fur Company store at Peoria and while so *engaged "exported the first produce in Chicago in 1825 in keel boats as far as the mouth of Kankakee River, and from there in Durham boats to Chicago, having built a warehouse in the former place in which to store in from the keel boats, to be taken by the Durham boats up the Aux Plain River."* The principal articles exported were pork, beans, and other provisions for the use of the fur company. (R. 139.) This incident is referred to by Judge McCulloch in "Early Days of Peoria and Chicago." (R. 140.)

Report of Select Committee to Eighteenth Congress dated February 11th, *1825;* repeated passages have been made "by uninterrupted navigation from the river (Illinois) into the Lake." (R. 141.) (*Unable to locate this in State case.*)

"The American Gazetteer," collected and compiled by *Jedidiah Morse,* printed in *1797,* under heading Illinois, "*The Illinois furnishes communication with Lake Michigan by the Chicago River between which and the Illinois are two portages, the length of which do not exceed four miles.* (R. 143–144.) (*Not in the State case and not in appellant's brief.*)

"*The Navigator,*" containing directions, etc., "for navigating the Ohio and Mississippi Rivers," published in Pittsburgh in 1824, says, "Between a branch of the Illinois and Chicago River which empties into Lake Michigan there is a portage of two miles; from this portage to the lake is a *bateau navigation of sixteen miles.* By this happy connection of waters there is a *complete communi-*

cation from New York to New Orleans, * * * the greatest stretch of inland navigation perhaps known in the world. This route is by * * * (here mentions the Great Lakes) *into the Chicago River mentioned above; thence down the Illinois and Mississippi Rivers.*" (R. 146–147.)

"Chicago Antiquities" contains a letter signed J. G. F. (Lieut. John G. Furman, U. S. A.), dated Fort Dearborn, 1830. "During the spring floods a considerable lake is formed, *the waters of which flow simultaneously through the Chicago, the Aux Plain, and the Illinois River into the great northern lakes and into the Mississippi.*" (R. 149.) (Not in State case and not referred to in appellant's brief.)

"The History and Geography of the Mississippi Valley, by *Timothy Flint, 1832,*" author, who traveled extensively and reputed to be a keen observer, careful in statement, says with reference to the Chicago-Desplaines route, "We have already remarked that at *certain seasons of the year boats of 5 tons burden already passed through the morass from one extremity of which the waters are discharged into the Chicago of Lake Michigan;* and from the other *into the Plain of the Illinois;* thus furnishing a natural communication between the two rivers. (R. 152–153.) (Not in State case; not referred to in appellant's brief.)

"Narrative of an Expedition through the Upper Mississippi in 1832," by *Schoolcraft,* enumerating routes between the Mississippi and the

Lakes, first mentions " By the Illinois and Chicago Creek * * *. The routes *by the Illinois and by the Wisconsin* were first laid open by the French enterprise and have been used *by canoes and flat-bottom boats* in their natural state * * * *for about 160 years.*"

"A Winter in the West," published in 1835 by *Charles F. Hoffman,* lawyer and editor, considered reliable and accurate, says with reference to the Chicago-Desplaines Route, " *Boats of 18 tons have actually passed over the intervening prairie* (the portage) at high water." (R. 156.) (*Not in State case and not referred to in appellant's brief.*)

The History of Will County, published in 1878, taken from histories of the country by Woodruff, Perrin, and Hill, says: "*As early as 1834 the products of the farm were boated down the Kankakee to the Desplaines, up the latter river to Chicago.* It is related that during the year named some parties loaded a boat on Sugar Creek, a tributary to the Iroquois, with 300 bushels of oats, 300 bushels of wheat, and some hams, with the design of taking them to Chicago to supply the garrisons there. The trip down the Kankakee was accomplished without accident, but after entering the Desplaines near Treats Island, the boat dipped water and so dampened the grain that they were obliged to unload and try to dispose of their products at that point." (R. 159.) (*Not in the State case and not referred to in appellant's brief.*)

George W. Reed, a witness called in the State case, and then 84 years of age, apparently refers to the same incident and tells of his brother buying 5 or 6 bushels of wheat, which they spread out on sheets and quilts to dry. (R. 2103.)

"Illinois in 1837" refers to the Chicago-Desplaines Route as one "used by traders as *a medium of communication between the Great Lakes and the Mississippi from the first discovery of the country by Europeans.*" Refers to the route as having been navigated by boats of some burden. (R. 162.) (Not in State case and not referred to in appellant's brief.)

"Narrative and Critical History of America, edited by *Justin Winsor*, librarian of Harvard University and corresponding secretary of the Harvard Massachusetts Historical Society, 1887." The book *refers to the Chicago-Desplaines route as one of the three trade routes of the Mississippi* and states that *this route appeared on the earliest maps of Marquette and Joliet and is displayed in the great 1684 map of Franquelin.* In "The Mississippi Basin," the same author says, "before the end of the seventeenth century *the portages at the head of Lake Michigan* had become the *best known* of all, and there had been a trading post for something like fifteen years at the Chicago River." (R. 166.)

"The Old Northwest," by B. A. Hinsdale, Ph. D., professor of science at the University of Michi-

gan, contains a reference to the Chicago-Illinois route. (R. 166–168.) Also in a volume of the American Nation Series, by Prof. Farrand. (R. 168.)

The "History of Wisconsin," by *William R. Smith*, regarded as one of the best local State histories, contains the reference to the *Chicago route* made by the United States Supreme Court in the Montello case.

Based on the foregoing authorities and on his own investigation, Professor Alvord testifies, "*My opinion is that from the latter part of the seventeenth century through the first third of the nineteenth century men engaged in the fur trade passed up and down the Chicago and Desplaines Rivers in canoes and flatboats very regularly. * * * That the most active trade carried on the two rivers falls between the period 1783 and 1825 or thereabouts;* that the traders found a very easy passageway by means of these rivers in the early spring. That during the time of drought, such as occurred in the summer or fall, the passage was hard, but *even then they forced their boats through the waterway, often being obliged, however, to carry their packages around the shoals and rapids.*

"*I have not found any historian writing of the situation in the West competent to pass judgment upon material and who had investigated material that denies that the Chicago and Desplaines Rivers were so used.*"

Witness says "barque" was a boat of several tons, and when La Salle used the word witness concluded he was discussing a deep waterway from Lakes to Gulf (R. 189.)

Use of wagon road does not disprove utility of waterway. (R. 281.) Says La Hontan trip was "of the Dr. Cook variety." (R. 284.)

One would not expect to find a very large number of accounts of the actual use of the river situated far from civilization like the Desplaines was at the time it was used by the fur traders. The men who were using it were not given to the pursuit of literature. The majority of them were illiterate French Canadians, and many of the English were not educated men. *The novelty of the travel over such a route had worn off,* so that it would be surprising if there had been preserved many narratives by the men who had made the journey by themselves. *To me it seems surprising that we have as many as we have preserved.* (R. 299.)

Hubbard's book contains a passage in which author tells that while eating breakfast at Mr. Kinzie's home he heard men coming up the river singing and shouting. He went out and saw *Governor Cass,* of Michigan, and his secretary, Robert Forsyth, in a birch-bark canoe manned by *thirteen men, twelve paddlers and a steersman,* rapidly approaching, keeping time with their paddles to a Canadian boat song. Cass had gone to

Green Bay by appointment to hold a treaty with the Winnebago and Menominee Tribes. They did not appear. News of hostilities reaching the governor he procured the canoe and crew, started up the river, making portage into the Wisconsin, down it and the Mississippi to Jefferson Barracks, below it, and to St. Louis. Persuaded commanding officer to charter steamer, and embarking troops, ascended Mississippi in search of hostile Indians. *On reaching mouth of Illinois, governor with his men and canoe left steamer, ascended stream and Desplaines, passing through Mud Lake into South Branch of the Chicago, making the trip from Green Bay in 13 days, averaging 60 to 70 miles travel each day.* (Abst. p. 305.) (Not in State case and not referred to in appellant's brief.)

Professor Andrew C. McLaughlin, head of department of history of University of Chicago (*not a witness in the State case*), had been professor of American history, University of Michigan, since 1891; before that assistant professor of history, three years; also in charge of bureau of historical research, Carnegie Institute, Washington. Twelve years associate editor American Historical Review, four of those years managing editor. Gives other connections. Author of Life of Lewis Cass and other writings. Has made special studies of methods used by historians; studied books on historical methods and teaches historical methods; called upon as editor American Historical Review to examine critical articles

sent for publication, the object in view being to discover whether historical methods were used. (R. 312–313.) With reference to Charlevoix's statement, says that the *inevitable conclusion* is that the Chicago & Desplaines River was *a known route at the time.* Speaks of *Heward's Manuscript* as a *source of the highest quality.* Says *article in St. Louis Enquirer* about thousands of boats being seen at St. Louis which had made a Desplaines passage appears to him to be *very influential evidence,* and that a paper in a small place would *not be apt to print something known to the citizens to be untrue. Regards Kinzie as a source of the highest quality.* Has written the life of Governor Cass and knows he made the trip referred to. (R., 322.) Says *Schoolcraft's statement that Illinois route had been used 160 years means Chicago-Desplaines-Illinois route. Has high opinion of Schoolcraft and doubts if any early writer knew the West better.* Speaks of *Forsyth* as evidence of the *highest source.* (R. 323.)

Referring to *Major Long's report* to Secretary of War, "that the portage is seldom more than three miles long in the dry seasons; but in the wet season boats pass and repass with facility between the two rivers," witness says it was an *official report and writer had no reason to color it.* Says that *Graham & Philips's* statement that in the spring boats of six and eight tons engaged in the

Mackinaw-Mississippi trade pass back and forth without having to make portage between Mackinaw and the Mississippi "*is very strong evidence, reaching almost a proof, that this route was a well-established route of communication.*" He says he is speaking of the passage standing alone without considering any of the supporting evidence. (Abst. pp. 325–326.) *Gives credence to statement* in Drown's history that *John Hamlin conveyed produce from Peoria to Chicago in Durham boats.* (R. 326–327.)

Anything coming from *Flint* has weight. Flint a well-known student of western conditions traveling very widely and published very widely.

From 1721 to 1825 "*The Desplaines River was used with apparently considerable frequency as a route of trade and commerce,*" presenting difficulties at some seasons, other seasons used with considerable ease, and was "a *well-known means of communication between the Lake region and the lower Illinois and Mississippi.*" (R. 327.)

Says of *Alvord* that he ranks with Turner and Thwaites as *among the best known writers and investigators of western history* (R. 328). Attaches *great weight* to the editorial from the St. Louis Enquirer by Thomas A. Benton. (R. 348-49.)

Dr. Reuben Gold Thwaites (*who was not a witness in the State case*) (R. 363) twenty-four years secretary and superintendent Wisconsin State

Historical Society, states historical connections, lecturer on American history, University of Wisconsin. My special field being period of discovery, exploration, and settlement of the basins of the St. Lawrence, Great Lakes, and Mississippi River from the earliest discovery to 1850. Obliged to make study of source material; sought access to all possible material, personally investigating official archives in Canada, United States, and Paris, numerous works published, and connection with some fifty historical organizations. Says "barque" meant a small sailing vessel and that was what LaSalle had in mind in speaking of a canal. (R. 368.)

Miami Indians scattered through Wisconsin and northern Illinois, but in 1670 began to settle around the St. Joe River. Others settled near Chicago about 1700. (R. 371-3.) Had been in Chicago a long time in 1721 (R. 374).

Shea's translation of Charlevoix has high standing among historians. Charlevoix, a trained navigator, speaks of Marquette and Joliet going up the Illinois and Desplaines Rivers to Chicago (R. 375).

No doubt about location of Mission of Guardian Angel at Chicago. (R. 375.) Notation in index to Jesuit Relations mentioning mission as on the St. Joseph River an error of one of twenty assistants in preparing index, which had about 280,000 references. (R. 378.) Discredits Lahontan (R. 381-

382.) Reviews historical testimony. (R. 384–394.) Says *Darby's book* and extract from St. Louis Enquirer *excellent source material, showing Chicago, Illinois route a well-established trade route.* Enquirer's article, while probably somewhat exaggerated, is valuable testimony; the editor, *Thomas A. Benton,* a *leading, if not the leading, citizen* of St. Louis, well-known and learned man noted for studious habits and tenacious memory, friend of Chouteau and other French traders, could not very well make a misstatement to readers who were well informed in regard to the matter (R. 395).

Refers to Hubbard's life and early trips. Says he made other similar trips in following years 1820–1825 with as many as twelve boats at a time (R., 400-401). *Says Hubbard's Narrative* must be regarded as "*conclusive proof without reference to other sources that the Desplaines River was frequently used for a number of years by the American Fur Company between Lake Michigan and the Mississippi*" (R., 403). *Governor Cass' letter shows the Illinois route to be well known* (R. 403–404). Likewise the suggestion made by John Kinzie (R., 404–405). Says Schoolcraft's reference to the Desplaines entitled to great weight; it refers to the Desplaines as a well-known and established route (R. 406). *Forsyth also shows Desplaines to be a well-established route* (R., 407–408). *Major Long's account* telling of the three-mile portage at seasons would be considered by historians as *con-*

clusive proof of the use of the route; he was an expert sent for the very purpose concerning which he was reported (R. 408–409). Graham & Phillips report also official; Phillips a judge of Illinois Supreme Court.

Gives weight to Keating, official chronicler of Long's expedition, who shows that the *Desplaines River was used by the Federal Government for the transport of supplies* (R. 410). *Childs* made the trip over the Desplaines, and his writings considered a primary source; "*Illinois in 1837*" and *Beck's Gazetteer acceptable contemporaneous evidence.* Publishers of former had a good reputation to maintain as publishers of guide books (R., 411). *Flint considered very accurate.* Mentions route as already used by boats of five tons burden. (R. 412.) Hoffman's Winter in the West, a conscientious record, refers to boats of 18 tons burden having actually passed over the intervening prairie at high water. (R. 413.) Gives "*The Navigator*" *high value* and has personally tested its accuracy. The reference in it to route convinces him that it was an accepted avenue of trade and travel. (R. 413–414.) Drown's history of Peoria shows use of investigation.

"*My opinion is that from the latter part of the seventeenth century to the first third of the nineteenth century men engaged in the fur trade actually and quite regularly passed up and down the Chicago and Desplaines Rivers in canoes and*

batteaux, Mackinaw boats, and other boats propelled by oars or poles laden with merchandise and furs; that these traders and travelers found a comparatively easy passageway by means of these rivers in the early spring and sometimes at other seasons; that during times of drought, such as often occurred in the summer and fall on most of the western portage routes between the Great Lakes and the Mississippi (as, for instance, on the well-known and much used Fox-Wisconsin portage route) the passage was sometimes difficult, but even then these fur traders appear to have succeeded in forcing their boats over the Chicago-Desplaines waterway, although perhaps they were obliged here and there to make some carriage at that time of the year, the length of the carriage varying greatly from season to season and from year to year according to the stage of the water." (R. 415.) *High opinion of Alvord, and says McLaughlin is one of the best trained historians in the country.* His judgment would have weight with every historian in the United States. (R. 416.)

With reference to the testimony of old settlers, says, "*There is a well-known rule of historical evidence that one piece of positive evidence is worth any quantity of negative evidence.*" (R. 474.) *He would look with considerable doubt on statements of old settlers as to what they remembered of what occurred 77 years ago.* Fact that wagons were frequently used to carry goods from

Chicago does not in any way rebut statement that the Desplaines River was similarly used. Horses were used between the Fox and Wisconsin Rivers. (R. 475.) Says that *Graham & Philips report* was made in 1819 *at the lowest stage of water known in this country.* (R. 476.) With reference to settlers coming into Illinois by wagon, Thwaites suggested incoming settlers *might not have had canoes or batteaux with them.* (R. 487–488.) Refers to statement of Peter Pond, a famous fur trader, in speaking of the *Fox River in 1773.* "*It took the most of ye next day to get about three miles with our large canoes.*" (R. 489.) *The Fox River had a fall of about 170 feet in 28 miles.* Thwaites basing his statement on Schoolcraft, says, "*Northern canoes such as fur traders used were 35 feet long by 6 feet wide and capable of carrying 4 tons* (R. 497); *pirogues larger than canoes; batteaux larger than the pirogues; they were 30 feet long, 8 feet wide, flat bottom, pointed bow and stern; rowed with six oars. Mackinaw boats, 40 or 50 feet long, flat-bottom boats, 12 feet wide, and 3 or 4 feet deep.* (R. 498.) *Durham boats about 60 feet long, 8 feet wide, capacity about 15 tons, drew about 20 inches of water.*" (R. 499.)

Hubbard discontinued using Desplaines in transporting goods and furs, *not because river was impassable,* but to reach Indians directly by horses instead of carrying them *in a roundabout manner* to subsidiary posts by boat and then to Indians on men's backs. (R. 504.) Indians at that time

largely on the northern rivers of Illinois. He notes that later when Hubbard wished to go to St. Louis he used Desplaines route. (R. 505.)

Great majority of men travelling upon the fur trade or as military expeditions not in habit of making records. Many unlicensed fur traders would naturally avoid making records; Jesuit missionaries obliged to make reports, which were forwarded to Paris. Great mass of material in French archives probably to be unearthed within the next twenty years, now that historical work is better organized. (R. 510–12.)

William Kramer, engineering expert, states qualifications. Is a deputy United States surveyor and familiar with the laws governing their actions, river always meandered up to point where navigation stops. Identifies notes of John Walls as official notes of the meander of the Desplaines River commonly taken as the best—as the original survey of the Desplaines River. Surveyors run the meander along the stream noting different objects; notes show surveyor continued northeasterly direction along the south line of Desplaines until he came to the township line between towns 38 and 39, which he marked "*Head of Navigation.*" He then crossed river and meandered down stream along the other side. (Note that Kramer's Exhibit 1 shows that "Head of Navigation" corresponds with point of contact (and at times portage) between Portage Lake and Desplaines.) (R. 520.)

Lyman E. Cooley, whom the evidence shows to be a most distinguished civil engineer and for exceptional reasons particularly and accurately informed in regard to the Desplaines River, testified for the Government. (R. 550.) His study of the Desplaines began in 1875; he *established a gauge at Riverside in 1886* and kept a practically continuous record of the stage of the water from that time down to *1910*, inclusive, to the time he testified. He made a topographical map of the basin and the minute and scientific study of the facts bearing on the sources from which the Desplaines was supplied, the character of the water course, and the causes which had resulted in a diminution of its natural flow. (R. 554.) The Desplaines River has "the appearance of an old water course or outlet from the Great Lakes in which the modern stream follows through remnants of an ancient stream of much greater magnitude, a succession of pools and wide expanses." Vegetable deposits indicate formerly a much greater depth now largely composed of numerous pools and connecting channels. His testimony and the other testimony in regard to the character of the river is summarized in the opinion of the court already quoted. He corroborates the historical testimony with reference to the stream's navigation and says that the physical conditions and topography "tend to show that the river was entirely competent for uses which have been related in regard to it." (604–605.) That the Mississippi and Missouri Rivers

have heavier currents than the Desplaines ever had. (607.) He also says, "From the physical standpoint it was entirely feasible to make such use as has been shown in the evidence of the historical experts. In fact, the physical conditions are better adapted to such use than any of the water trails that formerly existed between the Great Lakes and the waters of the Mississippi" (R. 612–613).

Data left from the past show that under natural conditions there was an uninterrupted navigation between the Chicago and Illinois Rivers for part of the year, during another portion portages from one to seven miles in length between the Chicago and Desplaines River, but after such portage boats could pass without interruption to the mouth of the Desplaines. (R. 113.)

He identifies various maps, profiles, references to a table of velocity prepared by the Deep Waterway Commission, and says that these are the maximum velocities, not the normal ones, yet even during extreme high water only the velocity at Joliet and at Marseilles is prohibitive. (R. 528.) Also, "A boat 8 feet wide, 32 feet long, with a depth of 30 inches sheer, 6 to 8 inches fore and aft—loaded draft of 20 inches and a block coefficient of 85 would displace about 11.3 tons." On a draft of 20 inches it would carry a cargo of 8 tons and a crew of six men with 900 pounds of supplies. It would carry a cargo of 5 tons on a draft of 15 inches. It would carry a cargo of 3 1/3

tons on a draft of 12 inches. (R. 634.) The shallowest point in the Desplaines during the low water line of 1883 was 15 inches. (R. 636.) No dams between Dam No. 1 and the mouth of the river. He explains the rule with reference to velocities and their relations to depth and slope. (R. 641.)

"Desplaines to-day from Dam No. 1 to mouth is a navigable river for boats drawing 3½ feet of water and up, depending on the stage of the water. With slight improvements as suggested 4½ feet and up." (R. 642.) Desplaines from Dam No. 1 in Joliet to mouth is "the connecting link in a water route extending 3,300 miles from Gulf of Mexico to the Gulf of the St. Lawrence." (R. 643.)

Desplaines River covered in 10 distinct surveys, reports, and projects, seven of which were official United States Government reports. The witness has read them all and says, "these reports uniformly recommend the improvement of the Desplaines River as the most available route for a highway between the Great Lakes and Mississippi Rivers." (R., 645.)

When gauge at Riverside read 13 feet there would be a minimum depth of 15 inches from Lockport to mouth, probably slight deficiency at Treat's Island and near the mouth.

Appellants solicited witness's services as expert engineer. Other parties offered him jobs as engineer in constructing dams over Desplaines and

Illinois Rivers, but he refused them all. (R. 790–1.)

Article introduced showing Rhone a steeper slope than the Desplaines. (R., 960.)

Table of certified gauge readings at Riverside introduced. (R. 961.)

G. A. M. Liljenerantz, assistant United States engineer, Chicago office, testified he has surveyed various rivers and harbors; read Government reports on improving Illinois, Desplaines, and Chicago Rivers, nine Government reports in all. (R. 648–650.) Especially examined same relative to matter of damages caused by proposed improvements; none contained any estimate of damages to riparian rights "if it was considered not a navigable stream, then there certainly would have been estimates," as engineer familiar with reports and procedure, would say that the engineers who made the nine reports already mentioned considered the Desplaines a navigable stream from Joliet to the north; examined reports for the special purpose of determining this point. (R. 652.)

Read from General Wilson's report, 1867; "it must be remembered that this river is not the exclusive property of those living upon its banks. It forms already an important link in a network of river navigation extending with its various branches through seventeen States in the Union." (R. 652.) Witness says reports of Worrall and Colonel McComb in 1875 agree that upper Illinois and enlarged canal from Joliet to Chicago

will afford the best route between Mississippi and Lake Michigan. Reports of Doran, 1875; Beneyaurd, 1882; Wisner, 1884; Comstock Board, 1887; Marshall, 1890, also agree on this point, and none contain estimates of damages to riparian owners; also the Ernst Board, 1905. Act of March 3rd, 1899, provided that estimates of costs for seven-foot channel from the upper Illinois to Lake Michigan be reported. (R. 667.) (No estimate of damages to riparian rights were included in the reports made pursuant to this act.)

D. H. Dugan, Sanitary District civil engineer, says 1901 low-water mark shown by gauge readings at Riverside, contained in House Report No. 263, was record low water. Gives depths of water at various places as shown by Sanitary District records. Minimum depth of river with augmented flow 3½ feet at low stage of water (R. 890).

B. F. Thomas, Cincinnati engineer in charge of Kentucky, Muskingum, and Big Sandy Rivers, had done work for War Department specializing in movable dams. Had examined Desplaines and says in present condition it could be navigated by steamboats without cordelling at all points save Joliet.

Horace S. Brown's work consists largely in removing rocks from rivers for Government; has done work on Mississippi, Ohio, and other rivers (R. 849). Ohio in places had a minimum depth of 15 inches, which was improved to about 3½ feet. Believes navigation of Desplaines from mouth to

Joliet is possible. Navigation could be greatly improved by removing bowlders. (R. 857.)

Montgomery Meigs, United States civil engineer in charge of Des Moines Rapids, says Desplaines from mouth to Joliet navigable by steamboats at present. About half of the boats on the Mississippi draw less than 3½ feet. (R. 882.)

Heilbron, civil engineer, took a trip on Desplaines from Joliet to Marseilles August 13, 1909, with the *Mississippi*, a steamboat about 35 feet long, 8 feet beam, inside draught about 15 to 18 inches, paddle wheel about 6 feet in diameter. Says Desplaines up to Joliet is a navigable stream. (R. 923.) Company operates two large boats and launch and several barges between Ottawa and lower Illinois on as little as 18 inches of water. (R. 925-927.) Witnesses Eidman, Clark, and Spencer took the trip with Heilbron. *Parry*, engineer, identifies certain maps and exhibits. (Pp. 544, 545, 964, 1026, 1028.)

Charles M. Coen, inventor of Coen's system of propulsion, which has been used in Miami and Erie Canal and around the Jersey City coast (R. 1000), states that in system described the propelling wheel, a screw wheel of the ordinary type, is located in a wheel chamber above the bottom of a boat as an extended dome so as to receive the full weight of atmospheric pressure from the outside on the wheel itself. That wheel chamber may be placed at any point in the bottom of the boat, allowing the bottom to be the lowest part.

Made a boat to float 100 bales of cotton for Fouch le Fevre, emptying into the Arkansas. Draft was 24 inches. Built boat on Yukon 110 feet long, 28 feet beam, draft 14 inches when loaded; house boat for Mississippi drawing 3½ inches; has built eight boats for the Miami and Erie Canal drawing from 9 inches to three feet, according to load. (R. 1002.)

Desplaines can be navigated by shallow craft. (R. 1006–1008.) Could build a boat that would carry a 50-ton load up and down the Desplaines. Boat would be 24 by 78, draft when loaded 18 inches. (R. 1009.)

In addition, the Government used the following evidence which had been used by the State of Illinois in its case:

George W. Reed, 84 years old March 2nd, 1908. Settled in Will County 1829. Father began construction of a dam about November, 1832. In about 1833 remembers seeing party going down Desplaines River in flatboat, singing, etc. They said they were going to a warmer country. (R. 2102.) Remembers some wheat which had been shipped at a point below getting wet. His brother brought home five or six bushels, and they dried it on quilts and sheets. (R. 2103.) Other testimony in regard to river prior to 1848 has already been referred to.

General Alexander McKenzie, Chief of Engineers, United States Army, in service 44 years, knows Desplaines principally through reports

and records. Says Desplaines is officially regarded as navigable stream under the law. There are a number of rivers in the south whose upper waters have as little depth as two feet upon which business is transacted. (R. 2110.) Says that from reports judges that river is not to-day capable of profitable commerce in the way usually conducted at the present time, but has before him records which indicate that it was at one time navigated by a certain class of boats (R. 2113-2114). When he said at hearing before Secretary of War Taft that Desplaines was not navigable, he meant not being navigated. Did not refer to actual legal conditions. Secretary's finding an impromptu affair; statement in regard to non-navigability " based principally on the presentation made by Mr. Snapp and the fact that Secretary did not have to decide whether it was navigable or not. That was not part of the decision " (R. 2117). In deciding navigability, department not influenced by existence of dams put in without permission. There were dams in the Desplaines River but no permission for them.

A letter from Mr. Oliver, Acting Secretary of War, dated October 28th, 1907, to Illinois attorney general, stating that the War Department considered the Desplaines and the Illinois between Lockport and Utica navigable streams.

Theodore E. Burton, Member of Congress since 1895, and Chairman of Committee on Rivers and Harbors since 1898, testifies that some rivers are

profitably navigated on a draft of 20 inches or less. Enumerates some of them (R. 2128).

Hillebrand's Exhibit No. 1 introduced. (R. 2172.)

George B. Fox, paper manufacturer, transports products over the Miami and Erie Canal, operated mills since 1868. (R. 2188.) Uses the Coen boat system, carrying 50 to 60 tons of freight on a draft of 2½ to 3 feet of water (R. 2189). Have 14 horsepower, are 18 feet length, 32 feet in breadth, built of iron and steel (R. 2191). These boats have caused the railroads to greatly reduce their rates (R. 2192).

Heyworth, an engineer in employ of the company, subpœnaed to bring the plans of the company, refused to do so on advice of counsel. Dam was to have been 18 to 22 feet high from the bottom of the river. He did some work on the dam before getting injunction. (R. 2196–7.)

Robert E. Orr testified with reference to Orr's Exhibit No. 1 and Exhibits 1 and 2. (R. 2203.)

Edgar Williams, civil engineer, associated with Mr. Cooley, testifies in regard to certain maps. (R. 2366–8.)

S. R. Van Sant, former governor of Minnesota, in transportation business on Mississippi River since 1857. Witness describes boats in use in his buiness having drafts of 14 inches, 18 inches, and up. (R. 2376.) On basis of hypothetical question, considers Desplaines navigable. (R. 2380.)

Wm. H. Zarley gives measurements of channel on each side of Treats Island. (R. 2386.) Numerous documents, including statutes, joint resolutions, engineering reports, estimates introduced in evidence. (R. 2393–2399.)

"List of Merchants' Steamboats Navigating on the Mississippi" shows four steamboats of 24 inches draft, having a tonnage of from 52.25 to 83.99 tons. (R. 2402–2407.)

APPELLANT'S EVIDENCE.

By consent the appellant introduced an abstract of a part of the evidence which it had used in its suit with the State of Illinois, as follows:

Depositions of Alexander, Williams, Meyers, Gurney, Munch, Boyne, Stevens, Adler, Burt, Layton, King, Comstock, Keene, Field, Bowers, Chamberlain, Hammond, O'Brien, Collins, McCowan, Killmer, related to recollections about early condition of Desplaines River and effect of such testimony has already been referred to. (R. 2485–2600.)

Robert Moore, consulting engineer, visited site of dam and estimates cost of riprapping banks of river. Says, judging from blue print, Desplaines was hardly a navigable stream in a commercial sense. (R. 2605–6.)

Bewley, steamboat captain, has navigated the Ohio on as little as 24 inches of water; a river which has a fall of 38 feet in 15½ miles, all of which occurred in stretches aggregating 6½ miles,

could not be navigated. (R. 2623.) Saw the Desplaines and thinks it is not navigable for useful purposes of commerce. (R. 2621.)

Pryor, steamboat pilot, does not think Desplaines a navigable stream. (R. 2629.) Gasoline not adapted to navigation of a rapid stream. Never saw or heard of a boat being operated on 16 or 18 inches of water, loaded or unloaded. (R. 2631.)

Mills, a farmer near Treats Island, used to own the island. Says only about five or six inches of water in river in summer. Remembers a fence in river up to 1871. Cross-examination made contract to sell to Mr. Munroe in 1904 and made transfer a few weeks ago. (R. 2642.)

Cornelius, Collins, Copelantz, Richards, Ellwood, all testified in regard to question of early navigation.

Whisler, steamboat man on Mississippi since 1865, saw Desplaines River twice and does not think it navigable.

McCaffrey, steamboat man since 1865, saw the Desplaines recently several times, does not think it navigable. Never navigated on two feet of water. (R. 2667–2668.)

Rambeau, McCullough, Doyle, and Mason, river steamboat pilots, have seen Desplaines and do not think it navigable.

L. L. Wheeler, civil engineer, thinks Desplaines was not navigable for commerce carried in boats.

(R. 2694). Is not familiar with the Desplaines since the drainage flow was turned in.

Snyder identified a map showing meander line of the lands of the canal. (R. 2719.)

Patrick Fogarty owned a quarry below Joliet. Says you could navigate the Desplaines in a boat drawing two or three feet of water from Patterson's Island to Treat's Island, but not below, except in a rowboat. (R. 2725.)

Brockway, president of Joliet, testifies as to low water in parts of the river. (R. 2731.)

Johnston, civil engineer, United States Engineer Corps, 1877–1886 employed by Economy Light & Power Company testifies in regard to gauge readings, slopes, etc. (R. 2739–2752.)

Munroe, Joliet real estate dealer, testifies in regard to low water. Does not think the river at present navigable.

Gray, engaged in steamboating, says Desplaines River not navigable for useful commerce. On cross-examination stated he carried 50 tons on steamboat with only two feet of water. (R. 2784.)

Counsel read from Parkman's La Salle and the Discovery of the Great West. (R. 2809.)

December 21st, Tonty, Membre, and party went from Fort Miami to Chicago and up a branch of Illinois (R. 2811). Letter from Father Membre tells of Desplaines being frozen in January and party dragged canoes over ice for 30 leagues. (R. 2815.)

Various acts of Congress, messages, reports introduced by defendant, abstract and brief in case of *Adam* v. *Druley*, opinion *State* v. *Economy Light & Power Company, etc.*

APPELLANT'S EVIDENCE TAKEN IN THIS CASE.

J. W. Woermann, civil engineer, had been employed by Government on Missouri River survey. Had charge Chicago River, 1896–97. Was in charge of construction work on appellant's plant. Investigated Desplaines; took gauge readings. (R. 1034.) Introduced copy of profile alleged to have been made in Wilson's survey, showing water around Treats Island as shallow as six inches. Table by Guthrie showing artificial additions to Desplaines from 1860–1867 through Bridgeport Canal pumps. Table showing rainfall, 1851–1895. (R. 1049.) On basis of Cooley's Riverside gauge figures, there would have been no water in Desplaines in natural condition in 1867. (R. 1050.) River little affected by deforestation or habitation. (R. 1052–1053.) Gives estimate and number of days in different years when Desplaines was seven-tenths of a foot deep or less. (R. 1057.) Made profile of Desplaines. (R. 1061.) Gives number of feet per mile of falls in certain parts (R. 1062) and gauge readings. Says that not over 9 days when the river at Riverside Bar was over $1\frac{7}{10}$ feet deep (R. 1063); no days in 1888; 50 in 1889, etc. Cooley's table of gauge readings has

little value on question of navigability. (R. 1065.) Does not show consecutive days. Ordinary conditions which would produce no discharge at Riverside would have same effect down the river. (R. 1069.)

Letter mentioning a gauge reading by Post and Paul and also by others showing Desplaines had slight flow in 1829. Other passages to same effect. (R. 1074.) Mostly Chicago sewage during dry season.

Attacks Cooley's accuracy. Says many statements referred to Desplaines not in a state of nature, but after proposed enlargement. Only feasible way to navigate Desplaines is to build a canal or dam. (R. 1080). Low-water discharge of Desplaines in 1883, 800 cubic feet per second. (R. 1081.) Flood conditions like 1892 only once in five or ten years. (R. 1086.) Introduces a map intended to show the streams and canals now used for purposes of transportation. Map does not contain Desplaines. Thinks Desplaines not navigable for purposes of useful commerce. Thinks Illinois River north of La Salle not navigable for useful purposes of commerce prior to 1900, "because of the dam at Marseilles, which was not provided with a lock and because of the steep rapids just below the dam and because of other shallow points above and below Marseilles." (R. 1089.) River navigable from La Salle to Ottawa. (R. 1088-1089.)

Cross-examination, Illinois River between Ottawa and La Salle navigated a year or two ago. "If there was a canal along the Marseilles Rapids, boats would go to the mouth of the Desplaines in low water with same facility that they reached La Salle before improvement of lower Illinois with increased flow from Sanitary District. Could probably navigate that part of river as easily as lower part of Illinois in its natural condition. By navigable stream I mean one which was or could be used for purpose of carrying on useful commerce in the way it is usually carried on. * * * If other conditions were favorable, river having more than a foot of water could be navigated for purpose of useful commerce. Not absolutely necessary that river should be absolutely free from snags and bowlders. If the river had a fall in it which is absolutely impossible to navigate, but had stretches above and below with sufficient water, whether or not I would consider that a navigable river because of that fall would depend upon the proportion of unnavigable fall or rapids as compared with portions navigable * * *. Recall no official documents describing Desplaines between Dam No. 1 and mouth as a nonnavigable river, nor do I recall any which calls it a navigable river." (R. 2074–2075.)

Introduces report of hearing before Taft already referred to. (R. 1937.) Introduced table of gauge readings purporting to show number of days when there was no discharge and number

when there was six inches depth or less. (R. 1939–1947.) Witness now an assistant to divisional engineer, United States Army, receiving $300 a month. Employed on the Missouri River 1890–91. Worked on Hennepin Canal and helped dredge Chicago River 1896. Worked on Illinois-Michigan Canal 1897. Constantly employed by Government from 1891 to 1902 under district engineer. (R. 1954.) 1902–1905 worked under the Ernst Board on project for 14-foot waterway from Chicago to Mississippi. Had access to sanitary district data. (R. 1955.) Private practice 1905–1908; expert witness in number of lawsuits against sanitary board. Was first employed by Economy Light & Power Company in January or February, 1908. Took charge construction work July, 1908, but was employed by its chief engineer July, 1907. Received $200 a month. (Colonel Bixby's letter March 27th, 1906 (R. 2871), shows that witness was then in Munroe's employ, and if distinction is made between Munroe and appellant, report of Taft hearing February 3rd, 1907, shows Woermann present among others representing appellant.)

Witness believes case of *People* v. *Economy Company* begun December 30th, 1907. At that time earth portion of dam at north end had been erected. Only portion extending into river was cofferdam which extended into river at upstream corner probably 150 feet. About 150 feet from river bank. At the cofferdam river was 250 to 300

feet wide in low water, 2,000 feet in high water. Construction on dam begun on right bank. Witness is receiving $300 a month as a Government engineer; has received about $800 or $1,000 as an expert in this case for appellant. (R. 1961.)

Discusses various dams, bridges, etc., which were or had been obstructions to navigation in the Desplaines. (R. 1969–1974.) In 1904 at Jefferson Bridge discharge had volume of 22,000 cubic feet per second and current of 7 4/10 miles per hour (R. 1965.) Shallowest parts of Desplaines at mouth and Treats Island. (R. 1965.) No particular difficulty for a skiff at either point. In July, 1889, witness went down the Desplaines from Adam's Dam to La Salle in a skiff. In 1904 went from Joliet to La Salle in a skiff. The boat was always in the water. Passed Treats Island and through the channel at mouth of river. Don't think they struck bottom anywhere. Kept sharp outlook to keep boat from turning over in swift water; was in the spring. (R. 1968.) Witness describes Jefferson Street Bridge, Rock Island, railroad bridge, Dam No. 1, and certain other past and present obstructions to river. (R. 1980–1983.)

Witness says slope of Desplaines at mouth as shown by profile 1867, one foot per thousand. Average depth across stream 3/10 foot and about 4/10 foot in the deepest part. (R. 1985.) Average velocity would be about 4/10 of a foot per second. Discharge on 180-foot width, which was the narrowest point in 1867, would be about 21

feet per second. Treat's Island depth of 8/10 of a foot in left-hand channel. In the rapids below Joliet, the shallowest point is 5/10 or 6/10 of a foot. (R. 1986.) Admits Wilson's profiles 1867 not extremely accurate, as measurements of slopes were not taken near enough together. (R. 2009.)

Counsel for Government read extracts from report of 1867 to show that survey was taken when waters in Desplaines and Illinois were extremely low (2010–2011).

Witness says, based on Johnston's table prepared for appellant, a gauge reading of 12 1/10 feet would give a volume of 116 second-feet, and at 11 4/10 feet there would be no water going over the bar at Riverside. Rainfall in 1867, 22 inches, whereas average from 1843 to 1910 was about 33 inches. (R. 2012.) Average dry river flow on Desplaines from Riverside was 13 second-feet; only 50 second-feet after waters of Dupage were added and 650 second-feet after Illinois and Michigan Canal sewerage waters were added (2014). Thinks deforestation had little effect on Desplaines. Counsel for Government reads extract of Professor Bain, University of Illinois, to contrary effect (2015). Also from Wilson and Gooding's report of 1868 (2016). Witness says reputation of Wilson and Gooding among engineers is good. Newspaper editorials of 1889 as to proposal to give water power to riparian owners as the price of their consent read into the record by counsel for appellant (2020–2021).

Witness intimates flow of Desplaines increased by inhabitants' use of artesian wells. (R. 2024–2025.) In regard to readings at Riverside gauge, witness took April 1st to December 1st as period of navigation. Admits ice generally goes out about March 1st. Some years in the latter part of February and March there is little or no ice. Supposes Illinois and Michigan Canal used after December 1st when there is no ice (2027).

Reads extract from Cooley giving low-water volume at 256 feet per minute in 1887 and 339 feet per minute in 1879. (R. 2031.) Also quotes Cooley as saying during large part of year Illinois River shallow, sluggish at times, stagnant, unhealthy, and unfit for profitable navigation (2033). Woermann says average flow of Jackson Creek 610 feet per second (2034). Flow at mouth of Desplaines would be 810 second-feet, assuming a drainage area of 1,026 square miles to and including Jackson Creek. Soundings of river around Treats Island were given on Marshall's map, depths from 1 to 3 feet. (R. 2038.) Editorial Daily News, December, 1888, states that village towns had a right to abate nuisance created by sending sewage down proposed canal.

Witness cross-examined on accuracy of his profile from Lockport to mouth, which he said was copied from Seddon's profile, whereas the latter only went to Joliet. Counsel for Government points out that navigable waterway from Chicago would be by drainage and ship canal to Joliet and

then down Desplaines to Illinois. (R. 2041–2042.) Woermann prefers Johnson's tables of Riverside gauge readings rather than discharge curve of Sanitary District, because he states latter was prejudiced against appellant. (R. 2046.) Woermann says fall between Romeo and Lake Joliet is 77 feet in 11 miles, and depth would be about 15 inches when gauge at Riverside was 13⅒ feet and flow there was 550 second-feet. Flow at mouth of Desplaines would be more (2047).

The difference between Prof. Cooley's table of gauge readings and the witnesses is that the latter omitted from December 1 to April 1 and Prof. Cooley included the whole year.

Usual depth of boats on western rivers 3½ to 4½ feet. (R. 2052.) Usual low-water period on Illinois 60 to 90 days, according to Wilson & Gooding's report, 1887. Woermann states period has been as long as 150 days. (R. 2052–2053.)

Ohio and Mississippi Rivers also have low-water periods, but navigation not interrupted to the same extent. (R. 2053.)

"As I stated a few moments ago, all of the Western rivers have periods of low water as compared with an average or flood flow; and I am also willing to admit that useful commerce may be entirely interrupted for two or three months in the fall, September, October, and November; and if the stream was navigable during the months of April, May, June, July, and August I would not say that it was not navigable because it was inter-

rupted for three months in the late summer or early fall." (R. 2054.) If it were also interrupted in May, June, July, and August, would not consider it navigable stream. (R. 2054.) Witness apparently assuming no navigation between December 1 and April 1.

Witness says 1867 profile represents usual low water flow in state of nature. Said Wilson and assistants made thorough soundings. (R. 2058.) Counsel for Government criticizes profile for showing fall of two feet in Lake Du Page. Witness thinks that a mistake of draftsman. (R. 2060.)

Witness quotes Cooley as stating low water volume at Riverside 1887, 4.27 second-feet. (R. 2063.) Witness says profiles of Marshall, Seddon, and Cooley practically the same. (R. 2072–2073.) Charter requires Sanitary District to turn in 20,000 cubic feet per minute for each 100,000 people or 400,000 cubic feet. (R. 2074.) Illinois River between Ottawa and La Salle navigable. A canal along Marseilles Rapids would extend navigability to mouth of Desplaines in low water without addition of flow from Sanitary Canal. (R. 2075.) Government introduced table showing average number of days between 1847 and 1896 when ice at Chicago made it necessary to close the river to navigation. Average number was 51. Mr. Woermann omitted December 1 to April 1, or 121 days, from gauge readings. (R. 2077.)

Woermann quotes extract from Moore, of United States Weather Bureau, to show deforesta-

tion has little or no effect on streams (R. 2080-2081). Aside from Army officers, only one assistant engineer receives more than he does, and only 12 get as much as $300 a month (R. 2086). Introduces table of average monthly rainfall near Peoria. (R. 2087.) Similar table for region above Riverside.

Appellant's historical expert, Judson F. Lee, 30 years old, specializing in history, teaching in Lewis Institute for about two years has studied history of Illinois and early transportaton problems, wrote thesis on this point. (R. 1091.) Has investigated influence of rivers on population (R. 1093). Early settlements were along rivers in Middle West. Settlers traveling down Ohio (R. 1095), Tennessee, and Mississippi Rivers. Early settlers in Illinois needed a market so urged inland improvements. Reads article from Pooley, Wisconsin University student, and extract from book by Ellen Semple to support the conclusions. Referred to history of Illinois by Governor Ford, which mentions various rivers along which people settled, but did not mention Desplaines. Other works read to show early settlers used rivers.

Extract from Turner's American History states early settlers' camp along rivers and timber lands. Says, when possible, settlers came by way of rivers. (R. 1108.) No instance where Desplaines was so used. Read from Hubbard to show Chicago only small village in 1818, and northern Illinois almost without population. Schoolcraft tells of trip

from Peoria to Chicago without finding a single house between. (R. 1112.) Article by Edwin Gale, early Chicago settler, states there were few white people in Illinois up to 1830. (R. 1113.) Ford's History of Illinois says a few small steamboats went up the Illinois as far as Peoria, sometimes farther. (R. 1115.) Little trading done.

Other articles to show Chicago's growth did not begin until 1830–1840. Exports from Chicago in 1840, $228,635. (P. 1119.) Commerce came to Chicago from interior by wagon (R. 1122) not by Desplaines. Reads from Chicago Weekly American, of 1842, to show that numberless wheat wagons came to town every day (R. 1123) from as far as 200 miles away. Reads extract from advertisement May 7, 1836, of wagon transportation from Chicago to Illinois River. (R. 1127.) Account by Woodruff, author of History of Will County, says that before opening of canal goods were transported from Chicago chiefly by ox teams and mail carried by stagecoach. Report of Canal Commissioners, 1825, says Desplaines is unnavigable in low stage of water (R. 1136), and urges that a canal be built.

Bucklin, engineer for Illinois-Michigan Canal, some time in 1818–1834 recommended the use of reservoirs to supply the canal. Articles in Chicago Tribune, Chicago Democrat, showing increase in trade after opening of canal. (R. 1140.) Stage coach from Chicago to Ottawa mentioned several times in different accounts. (R. 1143.)

Peoria Register, 1837, mentions fact that water communication between Illinois River could be opened by means of a canal. (R. 1148.) Ads. of transportation company carrying to and from Chicago by stage introduced. (R. 1149.)

History of Grundy County mentions use of Indian trails to Chicago. (R. 1153.) In 1834 road laid out following Indian trail. (R. 1155.) History of La Salle County shows fall of price of lumber, wheat, etc., as result of canal transportation. (R. 1158.)

Witness studied under Professors McLaughlin and Merriam, University of Chicago, the art of criticizing historical sources. (R. 1159–1160.) Criticizes Keating's account of early trip. Compares it with Schoolcraft's account. (R. 1160–1162.) Introduces extract from statement by United States engineer to support Schoolcraft. (R. 1165.) Says Keating's statement as to Desplaines based on hasty examination when river was high. Says Child's account based on high-water conditions. (R. 1166.) Says Morse Gazetteer statement that Desplaines was navigable stream was based on Hutchins. (R. 1168–1169.) Criticizes statement in Woodruff's History of Will County that steamers plied up to Chicago. Says nothing else to corroborate this. (R. 1170.) Hutchins never in Illinois (R. 1171), but based statements on Kennedy, who never got higher than mouth of Desplaines. (R. 1173.)

Says Darby never saw Desplaines. (R. 1174.) Says Darby's report was based on an editorial in the St. Louis Enquirer, the writer of which had for years advocated a lake to gulf deep waterway. (R. 1175.) Quotes several authorities to show small population in Illinois with no need of traffic mentioned in editorial. (R. 1179–1181.) Extract to show little lake commerce as early as 1840. (R. 1183.) Extract from Maj. Long showing necessity of a canal. (R. 1184.) He suggested Desplaines needed but little improvement to give canal service. Criticizes Alvord's translation of Charlevoix. Omitted the statement that "as the Desplaines is but a brook in this place, I was informed that at that time of the year I should not find water enough for my canoe."

Quotes Schoolcraft as saying Desplaines was so shallow that his party had to finish their trip on horseback; thought that a canal of 8 or 10 miles, while it would continue at all seasons, the connection which already exists between Chicago and Desplaines River would fall far short "of the grand purpose." Witness criticizes Imlay and says he relied on Hutchins's observations. (R. 1195.) Examines accounts of Gurdon Hubbard, who made several trips on Desplaines; mentions difficulties in making passage with loaded boats. (R. 1179.) Says while Maj. Long's statement as to navigability of the Desplaines would have considerable weight on account of his official position,

they should not take precedence of the evidence of the men who used the route. (R. 1200.) Does not say that he did not use the river, but says there was no evidence that he did has come to his attention.

Discusses Graham & Philips report and emphasizes the wagon road used in dry seasons. The witness thinks it was due to incoming settlers rather than to traffic to and from Lake Michigan. Northern Illinois not yet settled. Discusses Governor Cass's trip and says Cass took it not because it was well known but says because he wanted to notify the frontier posts. (R. 1203.) Gives opinion on various trips taken on the Desplaines, which were mentioned by Government witnesses. (R. 1204, etc.) Eleven men took such trips and wrote about them. Also mentions those who went over the route, but did not use them. Opinion is that men did not engage in trade on the Chicago and Desplaines Rivers as a regular thing between 1783 and 1825 (R. 1206) and that Desplaines in the natural state was not navigable for purposes of useful commerce. Head of navigation always referred to as on the Illinois (R. 1207) (says later newspaper advertisements referring to " head of navigation " as being the upper Illinois River probably meant the head of steamboat navigation). (R. 1318.)

On cross-examination witness says McLaughlin has good standing among historians; as a critic of historical material is one of the best in the country.

Conclusion subject to same criticism as anyone else's if not accurate. *Dr. Thwaites has always had a good standing.* Cross-examination brings out Lee's work as teacher more along the line of political science and economics than of history. (R. 1211.) Never taught history of Northwest Territory. Says when two historians disagree you should go by the one who prepared most thoroughly. (R. 1214.) No legal training. Does not know what would be legal evidence. Says McLaughlin took a law course at Michigan. (R. 1215.) Thinks Thwaites and Alvord may be careful critics, but is not sure. *Admits that million of events happen where only a few affirmative records of the event will appear.* (R. 1219.)

Has met Ellen Semple (whom he quoted above) and says her work on American history is considered to be very carefully written; Government then had witness read an extract from her book mentioning the use of the Chicago-Desplaines-Illinois route by early fur traders. (R. 1222.) Lee had not noticed this nor a map in her book showing the Chicago-Desplaines portage. (R. 1223.) Other extracts from her work were read showing early commerce over this route.

Asserts St. Louis editorial mentioning thousands of boats coming down the St. Louis is incorrect. (R. 1229.) Did not investigate work of different fur companies or make any special examination with reference to early fur traders. Says fact that early settlers did not come in by

Desplaines is strong though not conclusive evidence against its navigability. Says fact that there was not a good harbor or transportation facilities between Chicago and east was a good reason for the paucity of settlement in Desplaines region. (R. 1243.)

Counsel for Government had witness read a passage from Hulbert showing Desplaines-Illinois was a favorite route; also similar reference in Schoolcraft (R. 1245), although he had earlier mentioned taking a 30-mile portage in summer. Counsel explains this long portage by showing (R. 1247) that in 1849, for example, Ohio River was too low for transportation in the fall and Schoolcraft's journey might have been in a dry season. He mentioned (R. 1249) that it was a sultry season, being August, 1821. Keating made similar statement concerning 30-mile portage in very dry seasons and witness had criticized Keating's reliability. (R. 1253.) Witness knows of Professor Bourne, of Yale. Would give great weight to his word. Latter had high opinion of Keating. (R. 1254.) Witness had not read all of Pooley's thesis nor examined it carefully. (R. 1255.) Same is true in regard to Ford's History of Illinois. (R. 1258.) Also indirectly admits that neither extract tends to show whether upper Illinois and Desplaines were navigable or not. (R. 1259.) Had not read thoroughly works of Benton, Ford, McCarthy, and other authors from whom he quoted (R. 1261) and had not in-

vestigated their authenticity. He used Turner's New West as reference book. Said it had a reputation for accuracy, but he did not test it. (R. 1265.) Has read DuPratz, but has not examined him critically. Says Carter's Illinois Country is a reliable work. Carter in his preface expresses gratitude to Professor Alvord for his assistance, and mentions the latter's intimate knowledge of the field. (R. 1267.)

Witness thinks Keating inaccurate, as he said Chicago had poor soil and corn would not ripen. (R. 1270.) Greater weight to Schoolcraft than to Keating. (R. 1271.) Featherstonehaugh, an early writer, also criticized Keating, and witness gave considerable weight to his statement without examining passages in Keating very closely, but maintains Keating was a careless observer. (R. 1279.) On question of whether name of Indian tribe was Dacotah or Nacotah, several historians agreed with Keating, none with Featherstonehaugh. (R. 1281.) Counsel for Government had witness read from Major Long's report supporting Keating's statement that it was difficult to raise corn on Chicago soil. (R. 1297.) Witness admits that he does not know anything about the question of raising corn on Chicago soil in the forepart of the nineteenth century, or whether corn or maize was meant.

Witness not now sure Hutchins based statements on Kennedy. Admits Hutchins was at present site of St. Louis in 1776. (R. 1299.) Made

no investigation to find out who Kennedy was. Did not know whether he ever saw Hutchins after he made his journey in 1773. (R. 1302.) Made no exhaustive study of Darby (R. 1310), who gave great weight to St. Louis Enquirer editorial.

There was some early fur trade from Canada through Chicago. (R. 1313.) Heward, Perrault, and Hubbard used the Desplaines route. Relies on statement of Graham and Philips that " during half a year Desplaines does not contain enough water to float a boat." Says Hubbard did not " navigate " Desplaines, because he had to put his boat on rollers. (R. 1316.)

Did not have in mind when he drew his conclusion as to navigability of Desplaines the report of the select committee of the House of Representatives which stated that repeated and uninterrupted passages had been made from the river into the lake. Government had witness read from Smith's Life and Times of Louis Cass, an account of Cass's trip up the Desplaines with eighteen men in a canoe in July, 1827, in which the author refers to the fact that boats pass from the Desplaines into the Chicago to Mud Lake. (R. 1321-1323.)

Witness remembers no affirmative statement that Desplaines was not used by boats similar to those on the Fox, Wisconsin, prior to the use of steamboats. (R. 1323.) Says Charlevoix did not use Desplaines. (R. 1324.) Gives greater weight to Charlevoix than to Darby or Keating, although

he has not checked up Charlevoix carefully (R. 1325), and Charlevoix did not pass over the route, but his testimony has as much weight as if he had (R. 1327). Recalls Hubbard had a hard time going down the Desplaines and made a trip up the Desplaines, but witness did not remember so much about that trip. Says Desplaines in natural condition was not navigable for use of commerce. Knows little about the natural condition of the river. (R. 1330–1331.) Would call the fur trade useful commerce. Gives his reasons for thinking the Desplaines not navigable. Upper Illinois known as head of navigation; then considerable talk of building canal. Says no evidence that Desplaines was ever used for purposes of useful commerce regularly. (R. 1339.) Perrault, Heward, and Hubbard were the only three who used it for commerce.

Redirect examination: Wrote his thesis before he worked for the company. Read several extracts showing settlers were going to southern Illinois by the Wabash River in early part of nineteenth century. (R. 1342.) Most products from Illinois shipped down to New Orleans or St. Louis. Carter's Essay says French were responsible for England's failure to develop trade in Illinois Country. After cession of lands to England (R. 1345) goods chiefly went to New Orleans, a Spanish port. (R. 1353.) Says early map in Pooley's book showed as late as 1830 settlers following rivers, but had not got farther up the Illi-

nois River than Lewiston. They did not get farther up the Mississippi River than Quincy. (R. 1354.)

Says when Schoolcraft spoke of "the grand purpose" did not necessarily have in mind large boats. (R. 1355.) Extract from St. Cosme to effect that there was no water in Desplaines except in the spring. (R. 1360.) Says LaSalle made similar statement. Quotes from Turner to show settlers came along river when possible and most commerce from Illinois passed down Mississippi. (R. 1366.) Says Major Long inaccurate observer when he said ripples and rapids in Desplaines appeared only in low water, while at mouth of Vermillion there were formidable rapids. (R. 1369.) Says Hutchins lived in Illinois about 1770–71.

Counsel for Government had witness read quotation from Governor Gage, used by Carter. Mentioned Canadians as using northern routes for trade. Witness says Gage meant only trade of the far upper Mississippi. (R. 1380.) Also had witness read extract from Illinois Historical Collections, volume 2, saying great majority of residents in Cahokia and other Illinois towns came from Canada and continued to engage in trade in Illinois. (R. 1387.) Admitted Heward visited Cahokia in 1790.

Counsel for Government had witness read written authority to trade with savages in Cahokia in 1782, given to one Jean La Croix. (R. 1393.) Also

had witness read letter from Thomas Bentley in 1780. Bentley an early fur trader at Montreal. (R. 1395.) Also a memorial dated December 8th, 1784, from Francois Carbonneaux, of the Illinois country, "agent for the inhabitants thereof," speaking for "the inhabitants to the number of 400 families, exclusive of a like number at Post Vincent," and asking the United States Government to establish a valuable commerce which is now wholly carried on by British subjects from Canada. Also a letter from Joseph Parker to President St. Clair, dated October 2, 1787, complaining that traders from Michilimackinac and Detroit engross all the fur trade. "The traders in St. Louis and St. Genevieve on the other side of the Mississippi have not less than 100 traders who are supplied with goods annually from Michilimackinac and Detroit and sent down to Kaskaskia and Cahokia and the Spaniards come over and purchase them. Each trader purchases on an average from 30 to 40 thousand livres annually, which is $6,000." Also has witness read petition of Pierre Langois, of Kaskaskia County, of Illinois, 1786. Refers to a company "of the subjects of Great Britain" operating from Michilimackinac, who were getting possession of the commerce and have established at Cahokia, a trading post. Witness says that from this and other statements referred to in the evidence "should think there was an indication that there was some little commerce from the period 1782 to about 1817 that went by

way of St. Louis to Cahokia, Kaskaskia, and Canada; does not know how much. (R. 1398.)

Milo M. Quaife, for appellant. Thirty years old. Teaches history, Lewis Institute. Graduated Iowa College in Grinnell; 1903 taught in Sheffield (Ill.) High School. Following year pursued graduate studies University of Missouri, history and political science, M. A., spring of 1905; 1905 to 1908 graduate student University of Chicago, taking work in history and political science. History, major field. Doctor of philosophy, Magna cum laude, spring of 1908. Since fall of 1908 teaching at institute.

Published a monograph on "The Doctrine of Nonintervention of Slavery in the Territories," privately printed in 1910, which was his doctoral thesis; edited diary of President Polk, published in four volumes. Favorably reviewed.

May 18, 1911, read paper before Mississippi Valley Historical Association on the Chicago massacre. June, 1909, delivered lecture before Chicago Historical Society on "The Obscuration of James K. Polk." Two articles for publication in McLaughlin & Hart's Cyclopedia of American Government on Wilmot Proviso and Nonintervention with Slavery. Several months engaged in preparing history of Fort Dearborn. (R. 1399–1401.)

With reference to historical authors, states as follows: Beck rests statements on Graham and Philips. Seemed to have used other reports in general discussion. Adds nothing to Graham and

Philips. (R. 1401.) Cass's letter: Cass being able man and well informed, is worthy of consideration. Makes general mention of channel of trade by way of Chicago and Illinois. No specific mention of Desplaines. "When usable, the Desplaines would probably be used in connection with this route," other times not. Quotes Charlevoix's letter, "but as this river is only a brook in this place." (R. 1405.) Fact that Charlevoix mentions Chicago-Desplaines route as one of two routes of travel implies nothing as to navigability. Charlevoix told Desplaines would not float a canoe at that season, which was September, when witness states large part of the Desplaines dry. (R. 1408.)

Extract from Child shows "the canoe could and did go up the Desplaines in a time of flood." (R. 1409.) Darby not well acquainted with geographical conditions of this region. (R. 1411.) Careless in saying Enquirer's editorial settled problem of waterway. Thinks editorial prejudiced (R. 1412–1413) and by one not well informed as to river.

Most trade to Canada by way of Wabash (R. 1414) or on horses. Thinks Kenzie used horses in trade.

Extracts referring to period of 1778–1790, mention Wabash as principal trade route between western posts and Canada. Another passage says before cession of Illinois territory to English, trade in Illinois conducted by Canadian and Louisiana merchants; afterwards English mer-

chants started a commercial war for trade of the Ohio and the Mississippi, and had one decided advantage in being able to deliver goods cheaper than they could be delivered by way of lakes and the Wabash or up the Mississippi. (R. 1415–1417.)

Quotes Carter a teacher in the Illinois College at Jacksonville, graduate student of University of Illinois in work which won Justin Winsor prize, 1908, "Trade conditions in Illinois country, 1765–1775." Footnote quotes Hutchins as showing "during the French régime the French-Canadians traded extensively in this region." Carter says English found French fur traders hard to dislodge. Extract contains statement that surplus products of soil were floated down New Orleans, and that all flour for the lower country came from Illinois. Notes plans of Gage to invade Louisiana for purpose of controlling trade. (R. 1419–1423.)

Extract from manuscript by Jacob Varnum mentions trade falling off one-half in 1818. (R. 1425.) Memoirs of early days of Mackinac Island, by Elizabeth Baird, born there in 1810, tell of trip to Chicago in 1816. Captain could get no cargo for return trip. (R. 1429.) Says Graham and Philips report shows boat sometimes used Desplaines, but larger part of time it could not be used. (R. 1430.)

Drown and Dupratz not reliable. (R. 1433.) Latter said first travelers came by Illinois, when they came by Fox-Wisconsin route. (We note

they returned by the Illinois-Desplaines River.) Evans gives little light on use of Desplaines. (R. 1435.) Quotes from article by Prof. Craig, of Purdue University, on Indian town Ouiatanon, Ouiatanon, Indiana, which says, that while it is probable that fur traders visited this State between 1671 and 1683 it is probable that trading posts were not established until the Indian Confederacy was broken. (R. 1438.)

Quotes various extracts from different writings to show that on account of hostility of Iroquois Indians, portages from Lake Erie were little used until the eighteenth century, but later became of great importance. (R. 1442–1444.)

Quotes Andreas as saying that a route (which witness identifies as the Desplaines), became so dangerous soon after the opening of the 18th Century that it was gradually abandoned and finally almost forgotten—this on account of the long war between the Illinois and Iroquois. (R. 1444.) "I call attention to the citations from Andreas, showing that beginning about 1700 the use of the Desplaines route by the French, which had been comparatively frequent prior to that date was abandoned, owing to the wars which have been referred to in that connection." (R. 1450.)

Kinzie was in Chicago 1804 to 1812; Forsyth, his partner, was at Peoria. He relied mainly on the horses. 1812 to 1815, Kinzie's establishment was abandoned. (R. 1450–1451.) Witness says

this brings us to approximate date of the editorial, " and it is on the foregoing line of reasoning that I base my conclusion that the interpretation that thousands of boats such as were described in the editorial passed over from Lake Michigan to the Illinois in that period, is strained and exaggerated." (R. 1451.)

(Note that witness is mistaken, as editorial was written in 1819 when Graham and Phillips made their report.) Says the title of Hutchins's Topographical Description, " the road from Detroit to the Illinois " and its contents show that it is a well-known route in about 1774, and it is additional evidence to show that the principal relations between Illinois and Canada was by way of the Wabash. As to whether a journey by the Illinois can fairly be inferred to be by the Desplaines, the witness says it depends upon circumstances in each case. (R. 1451.)

Again refers to Carter as showing that in 1768 French controlled most of the trade in Illinois country and sent it out by way of New Orleans. (R. 1455–1460.) Says Flint was laborious and faithful compiler, relying largely on other writers. Thinks Flint never personally visited Chicago and was misled by the popular impression that Desplaines was a navigable stream. (R. 1460.) Says nothing to warrant Alvord's conclusion that Jesuits used the Chicago-Desplaines route as a usual thing. Says Schoolcraft, Tousey, and Kennedy by personal examination proved erroneous popular

impression that Desplaines was navigable. (R. 1462.)

Hoffman based on Keating and gives no additional weight. (R. 1464.) Keating thought a slight expenditure would cause Great Lakes to empty into Gulf as formerly they did. (R. 1466–1467.) Thinks Keating had no direct knowledge of Desplaines, as he speaks of it as being deep in June. (R. 1467.) Tousey examined river 1823, says it was ignorantly supposed that only a small sum would be necessary to open a waterway between Chicago and Illinois. Says such a waterway would be expensive, but cost would be justified. Says Schoolcraft disagreed with Keating on fertility of soil (R. 1470); concludes, Keating not very reliable. (R. 1471.) Quotes an article to show that soldiers had plenty of rations, whereas Keating said they didn't have. (R. 1473, 1476, 1479.)

Read from Featherstonehaugh criticizing Keating. (R. 1481–1487.) Reads from Prof. Bourne, who had a very high opinion of Keating and Schoolcraft, on how much of Carver's work was accurate. Both criticize Carver. (R. 1491–1497.) Quaife found only one adverse criticism of Featherstonehaugh "that may be regarded as at all serious." Witness says Keating went no farther than Desplaines, and formed conclusion as to its navigability. (R. 1506.) Discussed accuracies of Wau-Bun by Mrs. Kinzie. Considered accurate by Dr. Quaife and other historians. Tells

of Hubbard making trips down the Desplaines with difficulties. Witness referred to his trip easily made up the Desplaines in flood time with 12 boats (R., 1511), and one made with difficulty during the low-water season. Concludes that from 1818 to 1824 Desplaines route was used by American Fur Co. twice yearly, but the route was difficult and soon abandoned by Hubbard (R. 1515), who used horses instead.

Thinks Cass took route because all other routes blockaded by hostile Indians. (R. 1516–1520.) Suggests might have come by way of Chicago to warn whites and not because it was the best route. (R. 1520–1523.) All accounts agreed Cass made a very fast trip. Hubbard's account least trustworthy; McLaughlin's deduction from that account, that Desplaines is navigable, is unwarranted. (R. 1525.)

Hutchins a good authority. Says inference that Desplaines was navigable because of use of the word "portages" is unwarranted. "Illinois, 1837," not reliable. Imlay did not go up the Illinois River. (R. 1528.) Witness says that Prof. Alvord mixed up the trips of Joliet, Frontenac, and Dablon. (R. 1530.) Joliet overenthusiastic about the Illinois country and the Desplaines water route and made unwarranted statements. Witness suggests that Joliet and Marquette might have carried canoe from Chicago River to Illinois River. (R. 1532.) (Note.—Query: "How

did this make Joliet overenthusiastic about the Desplaines?")

Joutel took eight days to make 100 miles over the Illinois-Chicago route. (R. 1533.)

Historians have favorable opinion of John Kenzie, but he was a man of violent temper and had interest in reviving trade. He killed a rival in a business quarrel in a way suggestive of murder. "I don't know, I say, that it is susceptible of proof." (R. 1535.) La Hontan had a high rating, except for his fictitious account of a trip to the "Long River." (R. 1537.) Thinks it impossible that James Logan was ever in Illinois. Refers to passage in Maj. Long's report stating that the Chicago-Desplaines route needed but a little excavation to make it ample for a canal. Says Long did not personally visit all the places which he wrote about, but relied on information from others at times. (R. 1540.) Thinks he did come to Chicago and that he did see the Chicago-Desplaines route.

Witness says the Navigator was a reliable compilation. The paper referred to 2-mile portage between the Desplaines and Chicago Rivers, and witness explains this by suggesting that the editor was never over the route. (R. 1546.) Says the editor is not entirely "frank and truthful with his readers." It does not appear that the editor was ever over this route.

Says, contrary to Prof. Alvord, nothing in Ogden's letters showing that he was on Illinois River. States he plagiarized his account of the Illinois-Chicago River route (R. 1550) from an account by one Andrew Miller. Also probably from Harding and Evans. (R. 1557–1562.)

Says St. Cosme made a portage of 30 leagues on the Desplaines. Says Thwaites exaggerated when he said nothing could be made out of La Source's muddled accounts, but he admits they are a little mixed. (R. 1567.)

Says Pattin just copied Logan's report. (R. 1568.) Refers to Schoolcraft's journey, which he finished on horseback. (R. 1571.)

The article later refers to the Illinois-Chicago route as "one of the principal points where the waters of the Lakes and the Mississippi interlock." Schoolcraft also said the French had used this route for 160 years. Witness says this would be merely hearsay. (R. 1572.)

Discuss Warden's History of the United States, which states that Illinois affords an uninterrupted navigation of 460 miles for small boats up to where it approaches Lake Michigan. Says Warden used Long and Hutchins, and his statements add no weight. (R. 1574–1575.)

Regards Woodruff as untrustworthy. (R. 1578.) Early map makers referred to by Government relied on explorers' statements and were often inaccurate. (R. 1580.) Witness relied largely on Winsor in criticizing various maps. (R.

1597.) Witness then summarizes fourteen specific uses of the river; seven in the spring. "Cass also took a trip up the Desplaines in 1827 in July." (R. 1611.) Quaife differs with Prof. Alvord's conclusions (R. 1615) and Dr. Thwaite's conclusions. (R. 1617–1619.) Witness says for eight or nine months it was impossible to navigate the Desplaines, and his statement that it was merely difficult was unfair. (R. 1621.) Differed with Prof. McLaughlin's conclusions. (R. 1623.) Says McLaughlin did not examine some of the authorities which presented the difficulties in the strongest light. Quaife's conclusion is that the Desplaines was sometimes navigated by canoes and sometimes in the spring by boats, and other times navigation was extremely difficult, and usually impossible. (R. 1626.) Said maps introduced by Government largely based on hearsay. Says Morse relied on Hutchins. (R. 1633.) Some maps didn't mention the Desplaines River and some called it the Chicago River. Witness seems to think that all more or less inaccurate. (R. 1636.)

Witness refuses to answer yes or no as to whether the Desplaines was used by fur traders in the seventeenth century up to about 1830. He admits some canoes passed up and down. (R. 1645.) Refuses to draw any conclusions as to whether or not the Desplaines was ever used except in the fifteen instances pointed out. Presumed the river was used at other times, but no

written account was handed down. (R. 1646.) Would not say whether there was any fur trade in Illinois country in the eighteenth century. (R. 1660.) At any rate, Indian wars lessened the use of the Illinois-Desplaines route. (R. 1662.)

Counsel for Government read to witness a number of extracts commenting on the trade of the Illinois country around Cahokia, etc., to Canada. (R. 1667–1672.) On page 1685 appears a letter from Thomas Jefferson dated July 17, 1808, which refers to the formation of an Indian trading company to be "under the direction of a most excellent man, a Mr. Astor, of New York, long engaged in the business and perfectly master of it." Also letters from settlers and explorers commenting on such trade and its importance, showing that fur companies were carrying on a trade in the Illinois country of some considerable amount between 1780 and 1825. Hubbard, Deschamps, Kinzie and Forsyth, Berthold and Chouteau, and the American Fur Company were some of the traders and trading concerns. (R. 1687.) Witness would not say whether the most active period of trading was 1783 to 1825.

Again enumerated uses of the river. (R. 1689.) Reiterates statement that most of the time parties using the Desplaines had to push or roll their boats a good part of the way, as the water was so shallow. (R. 1696.) Blanchard's History of Chicago speaking as of 1880 gives an account of a Mr. Galloway moving his family and valuables

from Chicago in 1827 through Mud Lake and down the Desplaines and Illinois to their new home—a place then called the Grand Rapids of the Illinois. (R. 1702.) Counsel for Government read other extracts showing other trips not enumerated, but witness replied that he had not made an independent investigation and could not say whether the accounts were accurate or not. Admits other trips were possible, but steadily refuses to say other trips were made. (R. 1705.) Gives reasons for stating that most of 15 enumerated trips were made in spring or fall. (R. 1707.) Also difficulties encountered by each voyager. Gives detailed account of La Salle's trip (R. 1711–1713), and discusses other trips of La Salle (R. 1713–1715), and statement of La Salle that in the summer there was no water in the Desplaines as far as Fort St. Louis, where the navigation of the Illinois begins at this season and continues as far as the sea. (R. 1717.) He used canoes part of the time and part of the time a sailboat. (R. 1721.)

Cross-examination of witness on relative reliability of Keating and La Salle. (R. 1729–1730–1731.) Joutel's chief difficulty with Desplaines was excess of water in the river. (R. 1736.) St. Cosme found water too low and had to make a long portage of about 15 leagues. Charlevoix did not use route. (R. 1754–1757.) High opinion of Charlevoix's accuracy. (R. 1759–1760.) Discusses Heward's trip in 1870, Schoolcraft's. (R. 1769-

1774–1778–1779–1780.) Said he was acquainted with Beck's Gazetteer, the American State Papers. (R. 1802–1806.) Beck's Gazetteer referred to boats of 8 to 10 tons' burden passing through the Desplaines route. (R. 1807.) Witness said Beck referred to the time of the spring floods.

Reads from Wau-Bun to show that Kenzie used pack horses. Said Hubbard used pack horses also. (R. 1808–1809.) Discusses reliability of Darby when he said St. Louis Enquirer's editorial settled the question of the navigability of the Desplaines. (R. 1812.) Thinks Benton wrote editorial in about 1819. (R. 1814), and thinks Benton was never in Chicago. Might have talked with travelers, but probably never made a personal investigation. He does not believe statement in Drown's History of Peoria, that John Hamlin shipped provisions up the Desplaines in 1825. (R. 1821.) Witness says apparently Illinois River used to be Illinois and Desplaines on Dupratz's map. Dupratz had said there was some travel from Canada to the Mississippi by way of the Illinois. (R. 1827.) Refers to Joliet's, Hennepin's and Lahontan's maps as only ones which were, strictly speaking, first-grade sources. (R. 1829.)

Does not suppose the Desplaines route, or passage from Flint at any rate, in the light of my general knowledge of the subject, indicates that the Desplaines was used as an avenue of commerce commonly or generally. (R. 1831.)

Discussing Schoolcraft (R. 1833–1838), counsel for Government calls attention to witness' statement that Hoffman's account was based on Keating, and also calls attention to letter of Hoffman stating that he had discussed the canal with Maj. H., United States engineer. (R. 1840.)

Witness had said Hutchins' work was based on Kennedy's, but now says Kennedy never saw Desplaines. Hutchins had said there were only two portages, a 4-mile portage and a smaller one, between the Illinois and Desplaines Rivers.

Imlay said that Hutchins gave a good account of Illinois country. Witness agrees Imlay has high standing among historians. (R. 1851.) Governor Hull, of Michigan territory, discussed. Witness thought it unlikely he had ever been to Desplaines River personally. (R. 1855.) Says Lahontan probably told the truth, as he wanted the people for whom he was working to believe him, and they were somewhat acquainted with the Illinois country. (R. 1857.)

Says Kinzie probably did not tell the truth when writing to Cass, although he was writing to one somewhat familiar with the territory. This letter mentioned the importance of the Illinois-Desplaines route, "as at present boats of several tons burden" pass from Lake Michigan into the Mississippi. (R. 1856–1857.)

Witness discusses story about Kinzie once killing a man (R. 1857–1861) and about a court-mar-

tial once held to see if Kinzie was in the British service during the war of 1812. (R. 1862–1868.)

Government introduced a map by Edwin James, London, 1823, purporting to show route followed by Maj. Long in 1816–17 which went through Illinois River Valley and back again. Witness would not say positively that Maj. Long was in the Illinois country at that time. (R. 1871–72.)

Regarding Alvord's statement that Ogden was on the Illinois River, Quaife finds nothing in Ogden's letters to support this. (R. 1877). Quaife discussed a number of early maps. (R. 1882.) Don't think much of Woodruff's History, which mentions grain being shipped up the Desplaines. (R. 1885.) Says he wonders why they didn't ship anything else.

Cross-examined on general knowledge of maps. (R. 1885–1915.) Some of these maps show supposed portages; some, a line which might be the Desplaines; some indicated routes which travelers used; some the proposed canals; some of them were fairly good maps and some very poor. Attaches no significance to the fact that a certain map called a certain road between the Chicago and Desplaines Rivers a " portage road." (R. 1915.) Witness admits that he thinks it likely that traders used the Desplaines if they had occasion to go that way and found it practical to use it. (R. 1917.) He admits that it was used many times during the 40-year period of 1783–1825 by traders or travel-

ers, but would not go so far as to say that it was commonly used. (R. 1917–18.)

Alvord recalled to change a statement about "flat boats" to "flat-bottomed boats" which he said went up and down the Desplaines in the eighteenth and the first part of the nineteenth century. (R. 1919.)

Quaife took up Joutel's Journal and said that parts were missing and had been supplied by Margry "as best he might." (R. 1920.) Discussed other maps of Illinois country (R. 1923) by Governor Hull, of Michigan territory and Hennepin. (R. 1924.) Said maps were erroneous in many respects.

Gives opinion as to what papers of Hubbard were authentic and which were not. (R. 1926–1930.)

Hobart W. Harper, photographer, identifies photographs of Desplaines between Lockport and Romeo, about 2 miles above Lockport (R. 1974–1975), in the stretch between Chicago and Joliet, which show the river nearly dry at places which was taken September 12, 1908.

Daniel W. Mead for appellant. Forty-six years old. Civil engineer. Chief engineer for appellant. Professor of hydraulic and sanitary engineering, University of Wisconsin. (R. 1992.) Familiar in a general way with Desplaines River. (R. 1995.) Says flow would probably be maintained a little longer if stream was well forested,

but forests make little difference. Discusses this question. (R. 1997–1998.) Mr. Mead only familiar with Desplaines in a general way. Has passed over it. (R. 2000.) Admits deforestation would have larger effect on a stream with an impermeable subsoil like the Desplaines than on one with a permeable subsoil. Says large swamp area will somewhat prolong the flow of a stream, but not to any great extent. Agrees that forests consume less water than open country. (R. 2004.)

FACTS OF WHICH THE COURT TAKES JUDICIAL NOTICE.

There are many facts of past and current history of which the court must take judicial notice and which have a bearing upon this case. Particularly is this true with respect to the present state and importance of shallow-water navigation which has been the subject of much modern discussion. For the information of the court on this subject, we reprint as an appendix to this brief several articles dealing with shallow-water navigation.

I.

The portion of the Desplaines River in question is a navigable water of the United States subject to the paramount authority of Congress to protect its navigability.

1. The Desplaines River from Portage Lake to its mouth where it joined with the Kankakee to form the Illinois was navigable in a state of nature and for 160 years was actually navigated for commercial purposes.

(*a*) This is amply sustained by evidence.

(*b*) The District Court and Circuit Court of Appeals having concurred in this finding, the general rule applies, "that concurrent decisions of the two lower courts on an issue of fact will be accepted by this court unless shown to be clearly erroneous."

(1) *Luckenbach et al.* v. *McCohan Sugar Refining Co. et al.*, 248 U. S. 139.

(2) *The Wilderoft*, 201 U. S. 378–387.

(3) *The Carib Prince*, 170 U. S. 655–658.

2. The navigation of the Desplaines River by the means shown by the evidence in connection with foreign and interstate commerce makes it a navigable water of the United States.

The Montello, 20 Wallace, 430.

St. Anthony Water Power Company v. *Water Commissioners*, 168 U. S. 349, 359.

United States v. *Chandler Dunbar Company,* 229 U. S. 53.

Hickok v. *Hine,* 23 Ohio State Reporter, 523, 527.

Brown v. *Chadbourne,* 31 Maine, 9, 19, 23.

Moore v. *Sanborn,* 2 Mich. 519.

Morgan v. *King,* 35 N. Y. 454.

3. The fact that navigation may be difficult and at places interrupted does not render a stream unnavigable. (See cases supra.) The character of a river as a public highway is not determined by the frequency of its use, but its capacity for being used.

Hickok v. *Hine,* supra, and other cases cited.

4. Nor is it essential that the stream should be capable of being navigated at all seasons of the year.

Morgan v. *King,* supra.

Brown v. *Chadbourne,* supra.

Nor does navigability depend upon the amount of tonnage, depth of water, nor capacity for use by modern means of transportation.

The Montello, supra.

II.

Where a stream is navigable in a state of nature the power of Congress to protect and promote its navigability can not be lost or destroyed by nonuse or artificial depletion.

People v. *Page*, 56 N. Y. 834.

III.

As the Chicago-Desplaines-Illinois route was one of the navigable waters leading into the Mississippi actually being navigated when the ordinance of 1787 was adopted and when the acts of Congress of May 18, 1796,* and March 26, ~~1804~~ 1804, governing the sale of land in the territory were passed the public easement of navigation can never be destroyed or lost.

1. It was within the constitutional power of Congress to enact the provisions of the acts of 1796 and 1804 for the purpose of regulating interstate commerce by perpetuating the public highways constituted by the navigable streams in the Territories.

Coyle v. *Oklahoma*, 221 U. S. 559, 574.
U. S. v. *Sandoval*, 231 U. S. 28, 38.
Ruddy v. *Rossi*, 248 U. S. 104.

2. And these enactments were not affected by the admission of Illinois as a State. (See cases cited under 1.)

3. The provision of the act of 1796 "that all navigable rivers within the territory to be disposed of by virtue of this act shall be deemed to be and remain public highways" created a perpetual pub-

* C 29, 1 Stat 464, (Sect 9)
X C 35, 2 Stat 279. (Sect 6)

lic easement for the purposes of travel and appellant holds its title subject thereto.

4. The Government denies that the public easement over a navigable water can in any case be lost, but if the loss of such public easement were for any reason and in any case possible, it could not be possible in the case at bar since the very acts providing for the disposal of the land in question fixed the character of the navigable streams as public highways and make the public easement perpetual.

IV.

The act of March 3, 1899, is an act for the protection of the navigability of the stream and prevents impediments to its navigability even in the absence of actual navigation.

United States v. *Rio Grande Irrigation Co.,* 174 U. S. 690.

United States v. *Chandler Dunbar Company,* supra.

Discussed in the instant case, 256 Fed. 799, and so held by the court of appeals.

V.

As neither Congress nor the Illinois Legislature has consented or given authority for the building of the dam in question it is within the inhibition of the statute.

Cummings v. *Chicago,* 188 U. S. 410.

Montgomery v. *Portland,* 190 U. S. 89.

VI.

The fact that the plans for the dam have never been approved by the Chief of Engineers and by the Secretary of War likewise brings the proposed structure within the inhibition of the statute.

(See cases cited under V.)

VII.

Were it possible for the navigability of the stream to be lost (which the Government denies) navigability of the portion of the Desplaines in question in a state of nature and the present navigability resulting from the augmenting of its flow would bring it within the act of 1899 while at the same time the acts of 1796 and 1804 would prevent any claim that the act so applied was unconstitutional or affected vested property rights, since the riparian owner under the public land acts holds its title subject to the public easement.

VIII.

While firmly resting its case on the natural navigability of the stream the Government submits that the increased navigability of the stream caused by turning in the waters of Lake Michigan would, had it been unnavigable in a state of nature, bring it directly within the control of Congress and the terms of the acts of March 3, 1899.

Illinois v. *Economy Power Company,* 234 U. S. 497.

XII.

The portion of the Desplaines in question connects with the Sanitary and Ship Canal on the north and the Illinois on the south, thereby completing the navigable water connection between the Great Lakes and the Mississippi.

XIII [redacted].

The power of Congress to protect the navigability of waters does not rest alone on the power to regulate interstate and foreign commerce, but is also an incident of its power to make war, raise and support armies, etc. (Opinion of Court of Appeals, 256 Fed. 799.)

ARGUMENT.

In the course of its brief appellant states that the Government is seeking to use the act of March 3rd, 1899, to accomplish an inequitable and unjust end. That suggestion will be dealt with in its proper place, but here it is pointed out that it is obviously the sole purpose of the Government to protect the navigability of that part of the Desplaines River lying between its junction with the Illinois and Michigan Canal and Sanitary and Ship Canal at Joliet and its confluence with the Kankakee River at its mouth, a navigability demonstrated by the successful navigation carried on for purposes of useful foreign and interstate commerce for over 160 years until that navigation was prevented by the erection of dams and other

obstructions and superseded by the superior means afforded by the Illinois and Michigan Canal. Its good faith is demonstrated by the enormous importance of this link in the Lakes to the Gulf waterway, which has, in repeated reports of Government engineers, been declared to be the one available means of connecting the Sanitary and Ship Canal with the head of steamboat navigation on the Illinois at La Salle or Ottawa.

In considering the good faith of the Government, the court can not but take judicial notice of the fact that the State of Illinois itself had, prior to the beginning of the suit, empowered the general assembly by a constitutional amendment to expend $20,000,000.00 for the extension of the waterway through the strip in question and down to La Salle, and that legislative action for the expenditure of this sum in the improvement of this portion of the Desplaines and the upper Illinois had been taken by the general assembly, and that appellant's claim of a right to place a dam in the river has been the sole impediment which has delayed the completion of this improvement for nearly thirteen years. The steps by which appellant and its predecessor sought to put themselves in a position to exploit the water power created by the expenditure of $63,000,000.00 of public money have been referred to in the statement of facts and will be spoken of again in the argument.

I.

The portion of the Desplaines River in question was a part of the Chicago-Desplaines-Illinois route navigated for purposes of interstate and foreign commerce for 160 years by the usual means employed in lake and river navigation and was and is a navigable water of the United States and subject to the paramount authority of Congress to protect its navigability.

The position taken by the Government is that in this case in which it presented to the district court its bill in equity to prevent an unlawful obstruction to a navigable stream, it is entitled to have the merits of its case considered and decided upon the record in this cause without reference to conclusions reached by any other court in any other case between different parties.

Appellant, however, from the outset rests its case upon the conclusions of the Supreme Court of Illinois, in a case to which the United States was not a party, and in effect asks the reversal of the district court and the court of appeals on the ground that they do not harmonize with the conclusions of that court.

The district court found that the State court's judgment was "obviously rendered on record vitally different on the facts from record here as to actual use of stream for trade and travel by customary mode at time of use." While the Government, even if it were possible to present the

two records to this court would find it an endless task to compare them, and point out the vital differences appearing, it has with some painful labor examined and noted in this brief numerous items of important and compelling testimony received in the instant case and in no way touched upon by the evidence before the State court. But to show the essentially different character of the two records, it is only necessary to call attention to a portion of the State court's opinion quoted in appellant's brief at page 130. " There is not in this entire record a well-authenticated instance in which a boat engaged in commerce navigated the waters of the Desplaines River."

Compare this finding by the State court with the admission by appellant's own historical experts as to the commercial use of the river " from 1818 to 1824 " by the American Fur Company and the employment of a brigade of twelve to thirteen *Mackinaw boats* (R. 1660), which annually, at least during the years mentioned, made a voyage from Mackinac Island to Chicago and down to the company's trading posts on the Illinois, going by way of the Chicago-Desplaines-Illinois route, using two small portages in the fall and returning in the spring with their boats loaded with furs over an unbroken navigation of water by the route in question, and we have an indication of the essential difference between the record in the State

case and the record here. In view of this difference alone we submit that the decision of the State case can not be considered as in any way even persuasive, and we therefore proceed to present the case on the record presented in the district court.

Before dealing with other evidence concerning the navigability of the Desplaines River, attention is called to appellant's suggestion that, as there is no evidence of the navigation of the Desplaines *within the memory of living witnesses,* this is very persuasive that it is not navigable. In answer the Government calls attention to the fact that since 1848, *sixty-two years* prior to the time when the taking of evidence began in this case, the Desplaines has been paralleled by the Illinois and Michigan Canal, which was intended to and did afford an obviously superior navigation, and that according to counsel's own statement, there was a dam obstructing navigation on the site in question erected in 1826, three at least in 1833, one in 1835, at least two in 1839, one in 1841, and one at least in 1846, while the construction of the Illinois and Michigan Canal began in 1836. Without referring to the controverted question of how much the building of the canal and other causes depleted the flow of the Desplaines, it is enough to say that practical navigation of the Desplaines had been rendered impossible by artificial obstructions for at least *seventy-seven years* prior to the hearing of this cause, and that in consequence the absence of

proof by living witnesses of navigation within their memory is of no probative force.

In affirmative support of the navigability of the river, we have the concurrence of the two Federal courts passing on this case. The district court found proof of actual navigation from early fur-trading days down to the end of the first quarter of last century. "Proof of actual specific use by the customary mode of trade and travel by water—that is, by kind of craft then used for that purpose in rivers of the United States—throughout this period appears. Controversy here has really been as to extent rather than to the fact of such use." R. 37 The court of appeals specifically finds that "from the latter part of the seventeenth century, through the first third of the nineteenth century, men engaged in the fur trade passed up and down the Chicago and Desplaines Rivers in canoes and flat boats very regularly." It lists fourteen specific instances of the use of the Desplaines down to the year 1830; says many others not so well authenticated were disclosed and mentions numerous historical references to the Chicago-Illinois route. "No doubt other instances of its use may properly be inferred. It was employed by the American Fur Company down to 1825 and then abandoned for other routes." It finds that the fur trade was a leading branch of commerce in the western world and one of the characteristics of the Desplaines River. "Large quantities of supplies of various kinds needed by the settlers in a new

country were also transported over the Desplaines during the same period in boats of the size and character then commonly used in river commerce, this transportation being carried on between Chicago, St. Louis, and other points. Canoes of several tons burden were used; some were 35 feet long by 6 feet wide; some 33 feet long by 4½ feet wide, worked by paddles, occasionally a sail, and had a crew of eight men, carrying as much as 6,000 pounds of freight, as well as 1,000 pounds of provisions. The pirogues were manned by six or seven oars; the batteaux were larger than the pirogues; the Durham boats were heavy freight craft 60 feet long, 8 feet wide, 2 feet deep, with a capacity of 15 tons, drawing 20 inches of water." After referring to the dams, they say that some were constructed "as early as the year 1835, and their existence in the river was a source of obstruction to the commerce that had formerly been carried on."

We note here that appellant's chief historical witness says the boats used by the American Fur Company were Mackinaw boats "used on the Great Lakes and the rivers emptying into them." (R. 1660.)

In view of the well-established rule that where the district court and court of appeals have concurred on a question of fact this court will not disregard that finding unless it is clearly contrary to the evidence, the question arises as to what ground appears here for overturning the finding

of the two courts which the brief review of the evidence already given shows is definitely and affirmatively sustained by historical evidence of the highest character and supported by the conclusions of Professors Alvord, McLaughlin, and Thwaites, three of the most distinguished and well-grounded historians in western history; one of whom, Professor McLaughlin, has some special and unusual qualifications as an expert in the field of historical evidence.

Graham & Philips' Report to the Government in 1819 that boats of 6 and 8 tons engaged in the Mackinaw and Mississippi trade run through backwards and forwards so as to make no portage between Mackinaw and the Mississippi River in spring has already been referred to. This was not in the State case, nor was Hubbard's testimony as to the use of 12 and at times 13 Mackinaw boats navigating from Mackinaw down to the trading posts on the Illinois River by way of the Desplaines with some difficulty in the dry season and with an unbroken navigation coming back loaded with furs in the spring and being obliged at times to send back part of the boats to Chicago for an extra trip on account of the amount of furs.

Appellant's witnesses admit this course of trading from 1818 to 1825; but the American Fur Company, organized in 1816, was a reorganization of the Mackinac and Northwest companies formed in about 1784, and engaged in the Illinois River

fur trade, following the breakup of the "General Store" organized by a majority of the Mackinac merchants in 1778. (R. 1671.) And that the fur company was only continuing the methods employed by its predecessors is evidenced by Hubbard's statement in proof of the location of a certain house at Chicago in 1778 that "this tradition I received from Antoine Deschamps and Antoine Beson, who, from about 1778, had passed from Lake Michigan to the Illinois River yearly. They were old men when I first knew them in 1818." (R. 1667.) In 1818 Deschamps was superintendent of the Illinois trading post of the company, and had been engaged in the fur trade on the Mississippi, Illinois, and Ohio Rivers for about forty years.

Nor was there any evidence in the State case of the annual trips of Antoine Deschamps to St. Louis for supplies, nor the rapid trip made by Governor Cass, in July, 1827, according to appellants' witnesses (R., 1203), when he came up the river with his secretary in a canoe manned by 12 paddlers and a steersman and averaging 60 miles a day. Apparently there were 18 men in the canoe. (R., 305.) Nor was the letter from Governor Cass to the Secretary of War in 1815, stating that there are three great channels of communication by which goods may be introduced in the Mississippi and Missouri country from the British Dominions. One is by way of Chicago and down the Illinois. Nor the letter of John

Kinzie to Cass, saying that at present boats of several tons burden can pass from Lake Michigan into the Mississippi; nor the statement of William Darby, famous United States surveyor, in 1818, that the Chicago and Illinois Rivers offered the most natural and eligible connection between the northern and southern waters of the United States; nor Thomas A. Benton's editorial in the St. Louis Enquirer, in 1819, that "the French of Canada and of the Valley of Mississippi have communicated through this channel since the settlement of the countries. In high water, boats of ten or a dozen tons pass without obstruction. In dry season they are unloaded, drawn by oxen over a portage of a few miles. Hundreds, nay thousands, of boats have been seen at St. Louis which have made a similar passage." (R. 106.)

Mr. Schoolcraft's statement concerning his trip in August 13, 1821, nor the statement of Childs, a fur trader, recounting a trip in 1821, returning from St. Louis "by way of the Illinois River" and finding the portage full of water, nor the fact that the Illinois delegate got the Illinois boundary changed to give the State a port on the lake "to bring in the State northern settlers by the northern waterway," obviously referring to the Desplaines. Nor was the report of William H. Keating, professor of mineralogy and chemistry in the University of Pennsylvania, published in 1825 in London, which recounts that as they were informed that the Desplaines was frequently trav-

eled, they determined to use it, and were informed by Lieutenant Hopson, who accompanied them to the Desplaines, that he traveled it with ease in a boat loaded with lead and flour; nor was Fonda's trip up the Desplaines. Drown's Record of Historical Review of Peoria in 1850 states that John Hamlin, *still living in Peoria,* when a clerk in the American Fur Company store at Peoria exported the first products to Chicago in 1825 in keel boats as far as the mouth and from there in Durham boats to Chicago by way of the Desplaines. The report of the select committee to the Eighteenth Congress in 1825, stating that repeated passages have been made by uninterrupted navigation from the Illinois River into the lake, was not in the State case, nor the statement in the American Gazetteer in 1797. The Navigator in 1824 refers to the communication. The letter of Lieutenant John G. Furman, U. S. A., 1830, and the extract from Flint's History, 1832, are not in the State case. Schoolcraft's Narrative, 1832, says the route has been used by the French by canoes and flat-bottom boats in its natural state for 160 years. The statement by Charles F. Hoffman, 1835, of navigation by boats of 18 tons is not in the State case, nor the statement in the History of Will County, published in 1878, that farm products were boated up the Desplaines to Chicago. There is a reference to the use of the route from the first discovery of the country by Europeans "in Illinois in 1837," which is not in the State case.

(R. 162.) Justin Winsor's reference to the route as one of the three trade routes to the Mississippi states that before the end of the seventeenth century the portages at the head of Lake Michigan " have become the best known of all, and there had been a trading post for some fifteen years at the Chicago River." (R. 166.) There is a reference to the route in The Old Northwest; also one in History of Wisconsin. by William R. Smith, referred to in *The Montello.* Neither Professor McLaughlin nor Dr. Thwaites testified in the State case. Attention has been called to the fact that the United States surveyor in 1821 made a meander survey of the stream, noting the point of connection with Portage Lake, which connects with the Chicago River as " head of navigation." (R. 2301–2344.)

There is also a reference to Chittenden which is not in the State case, nor was Logan's report in December, 1718, to Governor Keith, of Pennsylvania, which describes the route, nor Charlevoix's reference to it in 1721, nor was the letter from Choiseul, prime minister of France, to the French agent negotiating peace terms, nor were the extracts from the Haldimand papers, nor the statemen of General Collot, governor of Guadeloupe, referring to navigation of the route by boats carrying from fifteen thousand to twenty thousand weight, made apparently in the latter part of the eighteenth century, nor was the statement of Robert Dickinson in 1793, nor the peace treaty nego-

tiated by Anthony Wayne in 1795, securing free passage over this route, nor the statement by Thomas Forsyth in 1814. We do not feel justified in going more into detail or referring to the numerous specific instances of navigation over the route which have already been referred to in our statement of the case.

Professor McLaughlin calls attention to the fact that the great majority of the men traveling upon the fur trade or in military expeditions were not in the habit of making records; that the unlicensed fur traders who were subject to severe punishment would naturally avoid making records, while the great mass of material in the French archives supplied by the Jesuit missionaries is still to be unearthed. Professor Alvord says that one would not expect to find many accounts of actual use of a river situated far from civilization like the Desplaines was when used in the fur trade. Men using it were not given to pursuit of literature, the majority being illiterate French Canadians, while many English were not educated men. "The novelty of the travel over such a route had worn off, so that it would be surprising if there had been preserved many narratives by the men who had made the journey by themselves. To me it seems surprising that we have as many as we have preserved." (R. 299.)

It is by the merest chance that specific instances of use by the American Fur Company have been preserved, although it is clear that it was regu-

larly so used by an Illinois brigade of thirteen Mackinaw boats from 1816 to 1825, and it is interesting that although Antoine Des Champs, its superintendent, a man of education and charming personality, was engaged in the fur trade over the Ohio and over the Chicago-Desplaines-Illinois route and on the Mississippi for over forty-seven years, we have no line from him concerning a single trip which he ever took. Appellant insistently relies on the fact that Hubbard, upon succeeding Des Champs in 1825, changed the method of reaching the Indian hunting grounds and substituted the mode of going directly to the grounds by pack horses, avoiding the necessity of carrying the merchandise from the trading posts along the Illinois River to the hunting grounds on the backs of men and also avoiding the difficulties of the navigation through Portage Lake in the fall. This evidence does not support but destroys his contention, for it shows the existence of a long-established navigation of the Desplaines which Hubbard had long urged Mr. Des Champs to abandon, " but without success," and it is interesting that although the testimony of the historical witnesses shows, and the context of the very statement in question evidences the fact that the Indian hunting grounds had receded far from the river, and it was necessary to transport the merchandise from, and the furs to, the river on the backs of men, Mr. Des Champs still preferred that means of navigation to the mode of transportation suggested.

Attention, however, is called to the engineering evidence, particularly that of Cooley, amply sustaining the navigable capacity of the river in a state of nature and corroborating the historical testimony in regard to its actual navigation. Reference is also here made to various articles and reports called to the attention of the court as facts of which it will take judicial notice and attached as an appendix, which clearly establish that a stream having the capacity of the Desplaines in a state of nature is and was prior to the time this suit was instituted, capable of being navigated by the same means by which a great and immensely profitable river navigation is now being carried on throughout the United States. Evidence on this point was also introduced at the trial and has been referred to. Here it may be noted in passing that the minimum low-water depth at the shallowest place of the strip in question was, in a state of nature, 18 inches while wooden inland waterway barges of 100 to 200 tons capacity are floated on a draft of 2 feet or less, while the testimony of Governor Van Sant shows practical river navigation on from 12 to 16 inches of water, while Coen testifies that boats could be built for navigation of the Desplaines carrying a 50-ton load on 18 inches of water, and three steamboats navigating the Mississippi appear in the register with a draft of 2 feet and a net tonnage of from 52 to 83 tons. The invention of the tunnel boat, the hundreds of thousands motor boats and motor barges in use,

and the use of steel and aluminum construction, supply means of shallow water river navigation far superior to the crude and clumsy means employed from 1673 to 1827 when wind and muscle furnished the only motor power and wood the only material.

To say that a stream which was successfully navigated by the crude means employed in river navigation in the seventeenth, eighteenth, and first third of the nineteenth centuries can not be successfully navigated by the superior means now furnished seems contrary to all reason. Navigation, like history, goes through certain cycles; in one we have navigation by small crafts in small units, like the 13 Mackinaw boats of the Illinois brigade of the American Fur Company, propelled by oars and sails and probably not exceeding in capacity ten or a dozen tons. Then we have a period of canal-boat navigation, then a steamboat navigation, and finally of such tonnage and of such extravagant cost of operation that it for a time disappears even from the Mississippi. Now we have returned to a period of successful shallow-water navigation by boats drawing even less than the Mackinaw boats of the fur traders. But very obviously the test by which the navigability of the stream is to be determined has not changed. Navigability is not a cat-and-mouse affair appearing during one period and disappearing with a change in current methods. In *The Montello*, 20 Wallace, 430, the court took the impregnable

position that " It would be a narrow rule to hold that in this country unless a river was capable of being navigated by steam or sail vessels it could not be treated as a public highway. The capability of use by the public for purposes of transportation and commerce affords the true criterion of the navigability of a river, rather than the extent and manner of that use. If it be capable in its natural state of being used for purposes of commerce, no matter in what mode the commerce may be conducted, it is navigable in fact and becomes in law a public river or highway."

The learned counsel for appellant, however, seeks to demonstrate that the navigability of the Desplaines River is not equal and was not equal in a state of nature to the navigability of the Fox River. We decline to enter upon that discussion, because we submit that the question is not whether the Desplaines River is equal in its navigable capacity to the Fox River referred to in the Montello case, but whether it meets the *test* of navigability there laid down. Counsel attempt to demonstrate that there were greater difficulties encountered in the navigation of the Desplaines than that of the Fox, but the court in the Montello case say: "The true test of the navigability of the stream does not depend upon the mode by which commerce is or may be conducted nor the difficulties attending navigation. If this was so, the public would be deprived of the use of many of the large

rivers of the country over which great rafts of lumber are constantly taken to market." Not only this, but it is perfectly obvious that the country would be deprived of the use of innumerable rivers which are now being navigated and of literally thousands of rivers and other navigable waters having sufficient navigable capacity, but which, on account of the fact that the development of the country has only begun, have not yet been put to commercial use. Too much insistence can not be placed upon the fact that the navigable waters of the country, not merely its great arteries, but the great network of navigable waters reaching every part of our territory constitute the main and only permanent transportation resource which the country has. Railroads in their operation consume a vast quantity of coal and steadily make for the inevitable depletion of that natural resource. A court can hardly avoid noting that we have now reached a point in their development where they are definitely inadequate to our transportation needs, and there is an increasing portion of our products which is unable to bear the actual cost of transportation. We are, therefore, at a point where the normal interchange of commodities must be assisted by a cheaper form of transportation or be largely curtailed.

What is true of freight traffic is rapidly becoming true of passenger traffic, and it has often been remarked that the low cost of transportation and the resulting general social and commercial inter-

course among our people is one of the strongest factors in making us a nation.

Thus, as the cost of transportation by the railroads increases it brings into clearer view the practical and national value of the navigability of our public waters.

That the national importance of a river rising in Wisconsin and flowing through the entire length of Illinois into the Mississippi should be doubted seems unthinkable.

The point suggested here is that when railroads began to be operated so cheaply as to make the navigation of navigable waters unprofitable, even in such notable instances as the Mississippi, this did not change the test of navigability, for if a stream was capable of being used for purposes of useful commerce, it continued to be navigable regardless of whether it could be profitably used for purposes of transportation in competition with other means at that particular moment or not. Likewise, as the stream in question here proved by actual test its availability and usefulness for purposes of interstate and foreign commerce for over a century and a half, it was and is a navigable water of the United States.

Counsel for appellant lays considerable stress on two cases decided in this court in which navigability was referred to. He calls attention to *United States* v. *Rio Grande, etc., Company,* 174 U. S. 690, and says that the distinction made between the Rio Grande and the Fox is even more

applicable to the Desplaines. It may be noted that in the case of the Rio Grande the only claim made was that in the part in question it had been used for floating and transportation of rafts, logs, and poles. The district court read numerous affidavits, extracts from geological reports, agricultural reports, reports of engineers, histories, and other information, and took judicial notice of the fact that the Rio Grande was not navigable within the territory of New Mexico. This ruling was sustained by the Supreme Court of New Mexico, and *the trial court's right to take judicial notice of the fact that the Rio Grande was not navigable within the limits of New Mexico was conceded by counsel for the Government at the trial, although the Attorney General on the argument declined to make the same concession.* (R. 696.) There was apparently no evidence of any navigability whatever except in times of unusual flood, and then only for the purpose of floating rafts, logs, and poles. Consequently the court say: "Its use for any purpose of transportation has been and is exceptional and only in cases of temporary high water." The court therefore say they are not "disposed to question the conclusion reached by the trial court and the Supreme Court of the Territory."

Comparing this for a moment with the case at bar, we find that the navigation of the Desplaines was not exceptional and not confined to periods of

high water. It continued for 160 years and was carried on in the dry season of September as well as the high-water period in the spring. The difficulty experienced by the American Fur Company in getting their mackinaw boats through the channel from the Chicago River to Portage Lake in the early fall was obviously due to the fact that they were required to be built sufficiently large and of sufficiently heavy material to navigate not merely the Desplaines River but Lake Michigan throughout its entire length. A review of the uses of the river will also show its actual navigation at practically all times during the year, with the exception of the driest and most sultry seasons when substantial portages were required, and we note that the rapid trip taken by Governor Cass averaging 60 miles a day in a canoe containing 18 men in 1827 was accomplished in a very sultry July and without any portage even between the Desplaines and the Chicago. In a word, the Desplaines was navigated in low-water stages with difficulty by large boats, and in the other stages without difficulty even by heavy mackinaw boats, but as this court has said, navigability does not depend on the difficulties attending navigation.

Appellant also relies on *Leovy* v. *United States,* 177 U. S. 621, 637. In this case the trial court told the jury that if you could travel by water continuously from one State to another the water is navigable water of the United States (p. 632), and in criticizing this the court says: "The mere ca-

pacity to pass in a boat of any size, however small, from one stream or rivulet to another, the jury is informed is sufficient to constitute a navigable water of the United States," and held that definition to be too broad. The Government will have occasion to refer to this case again and point out that navigability was in no way in question, and that the sole question involved was that of actual navigation. Counsel in another part of his brief relies on *Donnelly* v. *United States,* 228 U. S. 708, 709, which was the decision of this court on a petition for rehearing. In its first opinion, 228 U. S. 260, the court had said that " there was evidence in the record tending to show that the stream was navigable in fact at certain seasons from Requa (near its mouth) up to and above the locus in quo." The court then assumed that that question was not important, and that it bore only on the question of title, and held that as the river had been, in effect, declared to be nonnavigable by the California Legislature, it must therefore be treated as nonnavigable in law. This position was assailed in a petition for rehearing, attention being called to other decisions of the Supreme Court of California holding that the enumerating of certain rivers as navigable did not prevent other rivers, navigable in fact, being also so considered, and the court therefore said that " Our position respecting the navigability of the Klamath River and State ownership of the bed thereof is so serious in its ulterior consequences that it ought not to be ad-

hered to without further argument," and state that, as the prior opinion points out, " there was evidence tending to show that the stream is navigable in fact from Requa (near its mouth) up to and above the locus in quo, but the evidence was by no means conclusive," and not sufficient to enable the court to take judicial notice of the stream as being navigable in fact, " especially in the face of a declaration by the legislature of the State that it was not navigable."

The court then say that the plaintiff failed to suggest that the navigability of the river should be considered as a question of fact. And at page 711 that " if the suggestion of excluding the river from the reservation on the ground that it was navigable was intended to be made the subject of exception at the trial, this point should have been clearly raised; and it was not * * *. The state of the record, therefore, did not entitle the plaintiff in error to call upon this court to decide the merits of the question of the navigability of the river and its affect upon the jurisdiction of the circuit court over the homicide." The court thereupon recalled its decision on the question of the navigability of the river and said " that matter, therefore, we leave undecided."

The effect of the decision is, of course, to hold that as the question of navigability was not made an issue of fact, the plaintiff in error was not entitled to raise the question for the first time in the Supreme Court and require it to hold that the

river was navigable on incidental evidence received at the trial, since the issue had not been raised and the Government had had no opportunity to offer countervailing proof.

We have called attention to the fact that the navigation of the Desplaines was not confined to high water, but it is abundantly established by the decisions that if a stream is navigable for a portion of the year for sufficient length of time to answer the purpose of a common highway, it is navigable, and its navigability is not destroyed because it can not be used in other stages of the water. The question is very learnedly and ably discussed in *Brown* v. *Chadbourne,* 31 Maine 9; *Morgan* v. *King,* 35 N. Y. 454; and *Moore* v. *Sanborn,* 2 Mich. 519, which have become leading cases on the subject and cited by Mr. Justice Davis with approval in *The Montello,* supra, at page 443. See also Cooley, J., in *Thunder Bay River Booming Company* v. *Speechly,* 31 Mich. 335, p. 342; *Hickok* v. *Hine,* 23 Ohio State 527.

The District Court very aptly remarks that "controversy here has really been as to the extent rather than the fact of navigation." We submit that the navigability of the river is clearly established by the testimony taken on behalf of the appellant even without reference to any testimony presented by the Government and is beyond controversy.

Counsel has assumed that the court applies a different test to navigability in the case of the

Northwest Territory from the test of navigability generally. Very obviously, however, it did not, for it holds that the acts of 1796 and 1804 did not create navigability, but defined rights dependent on its existence. The whole effect of those enactments, therefore, was to fix the character of the streams then being navigated as public highways and assure beyond any possibility of question the perpetual character of the public easement of navigation. We submit, however, that even in the absence of such statutes that where navigability exists of such a kind as to bring a river within jurisdiction of Congress, the public easement arising from that fact can never be lost either by changed conditions, depletion, artificial impediment, changes in the mode of navigation, or other causes.

As already stated, the Desplaines was and had been navigated for over a century and a quarter by the means ordinarily employed in lake or river navigation at the time the enactments referred to were passed, and these enactments, as well as the provision of the ordinance of 1787 declaring the navigable waters leading into the Mississippi and St. Lawrence to be common highways, show that the navigability of these rivers then being used in interstate commerce was in the eyes of the legislators a matter of large and national importance and necessary to be preserved.

While the point is not involved here it may be proper to suggest that even if the stretch of the Desplaines in question had been " substantially

unnavigable without the artificial aid of canals" the fact that it served as a connection between the obviously navigable waters of Lake Michigan and the Illinois would in itself have rendered it a navigable water of the United States and within the protection of Congress. (*United States* v. *Chandler-Dunbar Company,* 229 U. S. 53, 66.)

II.

Where a stream is navigable in a state of nature, the power of Congress to protect and promote its navigability can not be destroyed by nonuser or artificial depletion.

There is an abundance of evidence furnished by the engineering experts, and in part based on gauge readings kept for a period of over twenty years, to show that in spite of depletions caused by deforestation, habitation, etc., the Desplaines remained navigable in fact, but it is submitted that neither depletion nor artificial impediments to navigability can destroy the public easement of navigation in a stream actually navigable and navigated in the state of nature. (*People* v. *Page,* 56 N. Y. 834.)

III.

The Government has never contended, nor did the court of appeals or the district court hold, that the acts of 1796 and 1804 created navigability; their effect is to define rights dependent on the existence of navigability.

The Government has never contended that the acts of 1796 and 1804 governing the disposition

of lands of the United States created navigability, but submits that the provision therein contained that "all navigable waters within the territory to be disposed of by virtue of this act shall be deemed to be and remain public highways" were enacted to make it certain beyond all controversy that the lands over which those navigable rivers flowed were subject to a perpetual easement of navigation in favor of the public. As already stated, the Government contends that where navigability exists of such a kind as to bring a stream within the jurisdiction of Congress, the public easement arising from that fact can never be lost either by changed conditions, depletion, artificial impediments, or other causes, and this quite apart from any statute on the subject. But in connection with these statutes, it further submits that were this otherwise and were it possible for any facts or circumstances to destroy, in the ordinary case, the easement of navigation, the specific provisions in these acts of Congress that the navigable rivers within the territory to be disposed of by virtue of the enactments "shall be deemed to be and remain public highways" would of its own force and effect create an indestructible public easement impossible to be lost.

The evidence already referred to abundantly established, and the courts found that the Desplaines River was a navigable stream, actually being navigated at the time of these enactments, and it necessarily follows that they are within their

scope, and that there exists over them a perpetual right of public navigation. The contention that these acts lost their force when Illinois became a State ignores the fact that at the time they were enacted the Government was the sovereign proprietor of the entire territory to be disposed of, and, in addition, Congress had not alone the powers of a sovereign proprietor, particularly those granted by the Fourth Article of the Constitution, but was, of course, in the full exercise of every constitutional power including its indubitable power to protect and preserve navigability of rivers; in these circumstances it took advantage of the situation by making the perpetual character of the easement of navigation over the then navigable rivers certain and assured beyond any possibility of doubt or question.

The Government has no doubt that in the absence of this legislation, the easement of navigation would have been indestructible, but it submits that the enactments in question put that matter beyond debate and were intended to do so.

That such enactments continue in force after a territory is organized as a state would not seem to require the citation of authorities, but we venture to refer to *Coyle* v. *Oklahoma, 221 U. S. 559,* where the court said at page 574:

> It may well happen that Congress should embrace in an enactment introducing a new State into the Union legislation intended as a regulation of commerce among the States,

> or with Indian tribes situated within the limits of such new State, or regulations touching the sole care and disposition of the public lands or reservations therein, which might be upheld as legislation within the sphere of the plain power of Congress.

The court then say, " such legislation would not derive its force from agreement or compact, but from the power of Congress over the subject." This was quoted with approval in *United States* v. *Sandoval,* 231 U. S. 28, at page 38.

The case is also obviously within the principles laid down in *Ruddy* v. *Rossi,* 248 U. S. 104, although apparently not within the doubt expressed by Mr. Justice Holmes. Unquestionably Congress could have reserved out of the territory a strip for the use of a public highway for purposes of interstate commerce or an easement over such a strip, and likewise it undoubtedly had power to make perpetual an easement of navigation over a public navigable water running through territory of which it was the sovereign proprietor and in the exercise of its other constitutional powers.

As the question of whether the ordinance of 1787 is still in force or has any legislative validity is, in view of the enactments referred to, of no importance here, the Government only suggests that while there is some dicta on the subject, the question has not been foreclosed and may well await a case in which it is vital to some decision. The provision of the ordinance, however, that " the

navigable waters leading into the Mississippi and St. Lawrence and the carrying places between the same shall be common highways and forever free as well to the inhabitants of said territory as to the citizens of the United States, etc.," is of importance, however, as showing that in the opinion of the Virginia Commissioners and the Continental Congress those rivers, although they might at places be impassable, had a vital relation to interstate commerce and to the national welfare, an opinion evidently shared by the Federal Congress which passed the acts already referred to. In the language of this court in *The Montello,* supra, " to preserve the national character of all the rivers leading into the Mississippi and St. Lawrence and to prevent a monopoly of their waters was the purpose of the ordinance of 1787."

IV.

The act of March 3, 1899, is an act for the protection of navigability and prevents impediments even in the absence of actual navigation.

On this point the Court of Appeals said, at page 799, " We think streams of actual navigable capacity but not now used for interstate commerce are within congressional power to preserve for purposes of transportation, and that the act of 1899 applies to such streams. If this is not the proper construction, very few interstate streams are within its terms." After referring to the manner in which great water routes could otherwise be de-

stroyed with the permission of the State, the court say, " Hundreds of like streams immensely important to the future welfare of the country on this theory could never come within the reach of congressional power except possibly through restoration by the States. We are unwilling to assent to this narrow view of the purpose of the act of 1899 and think it should be construed to refer to navigable capacity (which is the test of navigable water), and not rigidly restricted to streams floating interstate or foreign commerce at the time of its passage." In opposition appellant relies on two cases; the first is *United States* v. *Rio Grande Irrigation Company,* 174 U. S. 690, page 709, but in that case the court in reference to this act say, at page 690:

> The language is general and must be given full scope. It is not a prohibition of any obstruction to the navigation but any obstruction to the navigable capacity and anything whereof done or however done within the limits of the jurisdiction of the United States which tends to destroy the navigable capacity of one of the navigable waters of the United States is within the terms of the prohibition.

The language quoted by counsel for appellant is used with reference to the special circumstances of the case which were that an appropriation was being made of the upper waters of a navigable stream where it was not navigable and the court say that the question is one of fact " whether

such an appropriation substantially interferes with a navigable capacity within the limits where navigation is a recognized fact." The remanding order directs an inquiry as to whether the appropriation would "substantially diminish navigability of that stream within the limits of present navigability." *Leovy* v. *United States,* 177 U. S. 621, relied on by appellant has no bearing on this case as the act there involved was the act of 1890 prohibiting obstruction of navigation and the indictment was an indictment for obstructing navigation and not navigability. On the other hand this court in *United States* v. *Chandler-Dunbar Company,* 229 U. S. 53, applied this act in the removal of dams in a portion of St. Mary's River which in its then condition was not merely not navigated but impossible of navigation.

According to counsel's contention, the existence of obstructions to navigation of an otherwise perfectly navigable stream not only takes it out of the protection of the act of 1899 and permits further and unlimited obstructions without the consent of the Government, but places the stream beyond the control of Congress.

V.

As neither Congress nor the Illinois Legislature has consented or given authority for the building of the dam in question it is within the inhibition of the statute.

The statute specifically requires the consent of Congress or authority from the legislature before

an obstruction to navigability can be placed in a navigable stream. The question of navigability is one for the decision of this court, and when decided in the affirmative the question arises, "Is the obstruction prohibited by the terms of the act in question." If the navigable portions of the stream extend beyond the limits of the State, then the consent of Congress must be obtained. If they lie wholly within its limits, "structures may be built under the authority of the legislature" of the State. But any construction of a dam in navigable waters is absolutely prohibited unless there be "the consent of Congress" or the "authority of the legislature." The record in this case shows not only absence of authority on the part of the legislature, but an act approved December 6, 1907, specifically declaring the Desplaines and Illinois Rivers to be navigable streams and making it unlawful to construct any obstruction to their navigability and providing for the removal of obstructions then existing. In support of the point suggested, it is only necessary to refer to *Cummings* v. *Chicago*, 188 U. S. 410; *Montgomery* v. *Portland*, 190 U. S. . These cases likewise sustain the point that even if the plans had been actually approved by the Chief of Engineers and the Secretary of War, the attempted construction of the dam would have been unlawful and prohibited by the statute.

It was within the paramount authority of Congress over navigable rivers to impose any condition precedent to the building of a dam which it might deem necessary. It chose, in this present class of cases, to require authority from the State legislature. As that authority has not been obtained, the dam is prohibited.

VI.

The fact that the plans for the dam have never been approved by the Chief of Engineers and by the Secretary of War likewise brings this proposed structure within the inhibition of the statute.

In support of this point it is only necessary to refer to the terms of the statute itself.

VII.

Were it possible for the navigability of the stream to be lost, which the Government denies, and had the Desplaines ever ceased to be navigable, which is also denied, the navigability of the stream in a state of nature brought it directly within the protection of the acts of 1796 and 1804, and its augmented navigability would bring it within the terms of the act of 1899; there could be no claim that the act so applied would be unconstitutional or affect vested rights since the riparian owner under the acts in question holds its title subject to a perpetual public easement.

The practical situation with reference to the portion of the Desplaines in question is that at the time the land acts of 1796 and 1804 were passed, it was a navigable water of the United States

actually being navigated for purposes of useful interstate commerce, and by the terms of the acts, it was declared to be a permanent public highway over which the public easement was, of course, paramount. When appellant attempted to put its dam in the river, the flow had been increased by 300,000 cubic feet of water per minute, and there was flowing through the channel a volume of water abundantly ample for purposes of navigation. It was, therefore, navigable water in fact flowing through a channel made a public highway and completely within the terms of the statute quite a part from the question of the former volume. Appellant has insisted that a construction of the statute which would include such a stream would render it unconstitutional presumably as a taking of riparian rights without compensation. As the Desplaines, however, was, in terms, made a public highway, there can be no question of private rights or the constitutionality of the act of 1899 when applied to it.

While making the foregoing statement, we firmly adhere to the original ground taken that, irrespective of the land acts, as the Desplaines was navigable in a state of nature and useful for purposes of interstate commerce by the means formerly employed, its character as a navigable water of the United States could in no possible way be lost or destroyed.

VIII.

While firmly resting its case on the natural navigability of the Desplaines the Government submits that had it not been navigable in a state of nature, the navigability resulting from the addition of the waters of Lake Michigan would have brought it directly within the control of Congress and the terms of the act of March 3, 1899, without reference to the early acts.

The power of Congress to protect the navigability of waters useful in interstate commerce depends upon its possession of great constitutional powers such as the power to regulate interstate commerce.

The Government submits that in view of the record in this case showing natural navigability and actual navigation, the question of the Government's power to protect artificial navigability resulting from changes in volume does not arise but it feels itself unable to pass over or silently accept the suggestion that such a power does not exist, although a decision of the question may well be left to a case in which it is vital. In support of the suggestion, however, attention is called to *ex parte Boyer*, 109 U. S. 629, where it was held that a canal, although wholly artificial and wholly within the State, and subject to its ownership and control, was navigable water and "public water of the United States and within the legitimate scope" of its constitutional and admiralty jurisdiction. (R. 631.) The court further say that the case does not raise the question of canals used only

in intrastate business. In other words, the court distinctly place the Government's control over the canal on the ground of its being an instrumentality of interstate commerce. In *The Robert W. Parsons,* 191 U. S. 17, the court also held such a canal to be a navigable water of the United States and subject to the exclusive jurisdiction of the Federal courts. Also there is a statement in point in *Monongahela Navigation Company* v. *The United States,* 148 U. S. 312, where the court say, at page 342:

> But the power of Congress is not determined by the character of the highway. Nowhere in the Constitution is there given power in terms over highways unless it be in that clause to establish post offices and post roads. The power which Congress possesses in respect to this taking of property springs from the grant of power to regulate commerce, and the regulation of commerce implies as much control, as far-reaching power over an artificial, as over a natural highway. They are simply the means and instrumentalities of commerce, and the power of Congress to regulate commerce carries with it power over all the means and instrumentalities by which commerce is carried on.

It may be suggested here that where the court have used the words " in its natural condition " or " ordinary condition " it has used the words " natural " and " ordinary " to indicate a usual or periodic state of the water as distinguished

from unusual floods and not as distinguished from a volume due to artificial but permanent changes.

United States v. *Cress,* 243 U. S. 316, supports rather than denies this contention.* The effect of that decision was that Congress could not destroy the value of a mill and mill site on a nonnavigable creek without making compensation, but the court say at page 325 that they make no doubt that on the completion of the improvements the enlarged channels remain navigable waters of the United States for all purposes of Federal jurisdiction and regulation " notwithstanding the artificial character of the improvements; *Ex parte Boyer,* 109 U. S. 629, 632. *The Robert W. Parsons,* 191 U. S. 17, 28." These cases, we think, are authority for the proposition that any stream which has become navigable is subject to the power of Congress to protect that navigability.

Moreover the waters of Lake Michigan are public navigable waters and when diverted to a different channel, do not lose their public character and become private waters.

From what source does appellant obtain power to impound and control public waters of the United States turned into the channel of the Desplaines with the consent of the Government in aid of sanitation and commerce?

IX.

The War Department never in any way " assured appellant's predecessor that the Desplaines River was not a navigable stream," nor did it take any official action in regard to appellant's plans.

It has already been suggested that in view of the failure of the Illinois Legislature to authorize

* Refers to position stated under VIII

the construction of the dam and its affirmative action in prohibiting any obstruction in the river, it was necessarily impossible for the War Department by any action to authorize the construction of the dam here proposed.

Cummings v. *Chicago,* supra.
Montgomery v. *Portland,* supra.

Moreover, the naïve suggestion of counsel that in some way the War Department assured appellant's predecessor that the Desplaines was not navigable is sufficiently answered by a reference to the Government's opening part of its statement of facts. It will be noted that appellant's predecessor aimed at exploiting a water power created by the expenditure of about $63,000,000, raised by public taxation, and that when he set about to do so the water of the Desplaines had already been augmented by 300,000 cubic feet of water, turned in from Lake Michigan, while he himself had no interest of any kind as a riparian owner or otherwise, and the riparian owner from whom he subsequently took title had an interest only in the left bank of the stream. It is not necessary to discuss the transactions by which he possessed himself of the right bank of the stream then held by the Illinois-Michigan Canal Commissioners, nor discuss their conduct in making the transfer of the rights involved for a purely nominal consideration, when the development of the water power was obviously so essential and necessary

a part of the plan of the State and Nation to extend the Sanitary and Ship Canal and thereby complete deep waterway navigation from the Lakes to the Gulf. These acts, however, illuminate the subsequent activities of the appellant's predecessor in attempting to obtain some favorable action on the part of the War Department.

It is enough to say that Mr. Munroe approached the local engineer in Chicago, assuring him and insisting at every step that the Desplaines River was not a navigable stream. A reading of the letters of the Government officials shows that he did not ask Col. Bixby for light on that subject, but informed Col. Bixby that it was not navigable and that it was not necessary to ask the Government for any permission or authority of any kind. (Appellant has not put in evidence his letter to which the local engineer's letter referred and to which the letter of the Assistant Secretary was a reply.) They merely wished, as Col. Bixby says, to be assured that their plans were in harmony with the general plans reported by the Ernst Board. Col. Bixby recommended that if certain provisos were accepted by Mr. Munroe that he and Congressman Snapp "be informed that the War Department will waive any and all objections which it may have to the progress of such water-power dam construction." It was, in short, an attempt on the part of Mr. Munroe to get his plans approved on his representation that the river was a nonnavigable stream, and what Col. Bixby would be will-

ing to recommend upon such a representation is no index at all to what he would have been willing to do with the understanding that the stream was navigable. He was himself in no way authorized to pass upon the question of the stream's navigability. He merely said, I understand that the Government has no power in the premises; I therefore think it would be desirable for the Government to agree to waive any objection if Mr. Munroe will agree to certain things on his part. The Assistant Secretary of War responded by informing Mr. Munroe that while the work proposed appeared to be in general harmony with the improvement recommended by the Board of Engineers he was obliged to say that, as Congress had not authorized the improvement, the department " does not deem it expedient to take further and definite action in the matter of approving the plans."

Again, when appellant was informally in the Office of the Secretary of War, it informed him that the company sought no permit from the Government and declared that the Desplaines was not a navigable stream. When the Secretary asked Gen. McKenzie where the department got any jurisdiction, Mr. Snapp answered: " Let me answer, Mr. Secretary, as a lawyer; you undoubtedly have none." He went on to declare that the stream was not navigable and that they sought no permission, and the public had no rights in nonnavigable waters. The Secretary then said

that what had been done in the department was extra official beyond the authority of the Chief of Engineers, something done out of kindness of his heart.

Gen. McKenzie, testifying afterwards, said that what was said with reference to nonnavigability was based principally on the presentation made by Mr. Snapp and the fact that the Secretary did not have to decide whether it was navigable or not. After reading the record on this subject, counsel's contention that the War Department assured appellant's predecessor that the stream was nonnavigable has some elements of humor.

We note that when in October of 1907 the Illinois attorney general asked the War Department whether the Desplaines was a navigable stream, the Secretary, apparently after examining the question, answered that it was, and doubtless if Mr. Munroe had asked it the same question he would have received the same reply.

X.

No action of the War Department, even of the most formal kind, could estop the United States from asserting and protecting the navigability of a stream and from removing or preventing an obstruction to its navigability and without compensation.

The principle is well established that the power to protect navigation is illimitable and that the Government of the United States is not estopped by the action of its officials or by prior congres-

sional action. The power to prevent obstructions and promote navigation is a continuing power not exhausted by one exercise, but a sovereign power analogous in its illimitable exertion to the police power. Some of the cases sustaining this doctrine are referred to under Point X, supra.

However, no official action of any kind was here taken by the War Department, except to inform the State of Illinois that the river was a non-navigable stream.

The facts already referred to dispose of counsel's contention that the purpose of the act requiring approval of the plans had been complied with.

When the Chief of Engineers is asked to approve plans for a dam in a navigable stream, he is asked to act officially and perform a duty imposed by the act of 1899, and he approves or disapproves of the plans in their relation to the question of whether they will or will not interfere with navigation. In the present case the representation made by appellant was that the stream was not navigable and the Government had no power in the matter. He was, therefore, not asked to exert the authority conferred on him by the act in question, and, as the Secretary of War himself says, any action taken was extra official; and it is also noted that the Assistant Secretary of War in turn declined "to take further and definite action in the matter of approving the plans."

XI.

This court has never passed on the merits in the present controversy in any of its phases, but has expressly declined so to do.

Counsel maintains that this court has intimated that the acts of the War Department should prevent interference with the construction of the work. We submit, nothing could be more far-fetched.

In the case referred, *Illinois* v. *Economy Light*, etc., 234 U. S. 497, the court declined to take jurisdiction, on the ground that the issue between the State and the Company as to whether or not the river were navigable was a question of fact not reviewable on appeal from the State court. The State, however, presented an ingenious theory that the United States Government had undertaken the improvement of the river, and therefore the State was entitled to assert "on behalf of the citizens of all of the United States the right to prevent interferences with that improvement." Without passing on this very unusual claim, this court pointed out that the appropriations were not for improvements undertaken but for improvements which might be undertaken—not a jurisdiction exercised but a jurisdiction that might be exercised—and called attention to the fact that the War Department had on that account refused to take action in the matter of approving the plans, and said: "It is manifest, therefore, that the State has

no right under Federal laws which it may assert for itself or 'on behalf of the citizens of all of the United States and the motion to dismiss must be granted." (R. 524.)

The effect of the decision is that the State could not ask this court to review the question of navigability decided adversely to it in the Illinois Supreme Court, nor could it, even if such a thing were possible, assert a right on behalf of the citizens of all of the United States, based on a Federal improvement undertaken which was being interfered with by the defendant in error first, because "the State is not the instrument through which the jurisdiction can be exercised," and, second, for the reason that the Government had not in fact undertaken the improvement, and consequently there was no right under the acts of 1889, 1900, and 1902 which the State court assert "on behalf of the citizens of all of the United States," if such a thing were possible.

XII.

Under point XI counsel for appellant has contended that the portion of the Desplaines is question can not be navigable water of the United States and does not connect with any other body of water so as to make it usable in interstate commerce.

A complete answer to that suggestion is found in a reference to the evidence, showing navigation throughout the entire length of the Desplaines from Riverside to the Mississippi in connection with Lake Michigan, and the navigation carried

on between Mackinaw and the lower reaches of the Illinois River. The evidence sustaining the navigability of this reach of the Desplaines likewise sustains the navigability of the upper Illinois with which it connects, and not only does it connect with the Desplaines above Joliet, which was navigable in the state of nature, but also the Illinois-Michigan Canal which connects with Lake Michigan and the Sanitary and Ship Canal which presents deep waterway navigation between Lake Michigan and its connection with the Desplaines.

Incidentally counsel contends that the Sanitary and Ship Canal is not a waterway of the United States. He, himself, quotes from section 24 of the act of May 29, 1889, which provided, that when the channel was completed " and the water turned therein to the amount of 300,000 cubic feet per minute, the same is hereby declared a navigable stream."

As the evidence shows that the flow of water varies between 250,000 and 360,000 cubic feet per minute, it has become, by the terms of the act of the legislature itself, a navigable stream. It further provides " and when the general Government shall improve the Illinois and Desplaines Rivers for navigation to connect with this channel, said general Government shall have full control over the same for navigation purposes, but not to interfere with its control for sanitary or drainage purposes." So far as this latter provision is restrictive, it can have no effect, since the jurisdiction of

Congress and of courts of admiralty over navigable waters arises from the paramount powers conferred by the Federal Constitution and does not lie in the grant of the State Legislature. *Ex parte Boyer,* supra, and other cases cited.

It has already been noted that the concurrent joint resolution accompanying this act stated that it was the purpose of the legislature to provide a ship canal from Chicago to the Mississippi River and asked the cooperation of the General Government in the construction of the channel from Joliet to the Mississippi. Not only is the character of the Sanitary and Ship Canal as a public highway established by these acts [illegible] by its obviously navigable capacity, but this court would naturally, we think, take judicial notice of the fact that it has been actually navigated for the last nineteen years, that the Sanitary District has maintained and operated locks for the passage of the boats, advertised the advantages of water transportation in connection with the sale of lands which it was obliged to acquire by condemnation, that for years a passenger packet has navigated between Joliet and Chicago, and that in every conceivable way its character as a navigable stream has been completely established.

From all of this it is clear that not only was the portion of the Desplaines in question a part of the Chicago-Desplaines, Illinois, route used for interstate and foreign commerce through the period of 160 years, but it is now the connecting

link between the Illinois on the south and three navigable means of reaching Lake Michigan from Joliet on the north.

XIII.

The power of Congress over navigable streams does not rest alone on its power to regulate interstate and foreign commerce, but finds support also as an incident to the power to make war, to raise and support armies, and other like general powers.

In this connection, the Court of Appeals said: "It is urged that the act of 1899 was passed under the constitutional power to preserve interstate commerce, and as no such commerce on the Desplaines then existed, the statutes can have no effect, and that if the statute be construed to reach beyond this, it was to that exent beyond the legislative power. Even so, it might be regarded under the war power. We have already had a significant reminder of the inadequacy of railroad transportation in a time of stress."

As one of the primary purposes named in the preamble of the Constitution is to provide for the common defense, it seems impossible to say that the great powers to make war and raise armies given Congress in aid of that primary purpose, do not include the power to protect the navigability of the rivers and navigable waters of the United States; and this quite apart from, and independent of, the existence of a power to regulate interstate commerce. The importance of public waters to the common defense needs no argument, and that their relation to that purpose has always been

assumed is shown by the fact that from the beginning they were placed under the jurisdiction of the War Department. Their usefulness in aid of transportation continues when roads and railroads are destroyed, or are pressed beyond their capacity. To assume that navigable streams have no national importance except for purely commercial purposes, and are not within any of the powers of Congress except the power to regulate interstate commerce, is to ignore the great purposes for which our Constitution was ordained and established.

CONCLUSION.

The national importance of the Desplaines as a means of interstate commerce was recognized by the distinguished commissioners of the State of Virginia and the Continental Congress of the United States in the declaration that the navigable waters leading in the Mississippi " shall be common highways and forever free to the inhabitants of the territory and the citizens of the United States;" since it was one of the three great avenues from the St. Lawrence to the Mississippi referred to by Mr. Justice Davis in *The Montello,* supra.

The Federal Congress likewise recognized the importance of these waterways by their declaration in early enactments that they should be and remain public highways.

The river had a great, continuous, and prosperous navigation from the time of its early discovery by

the French in the latter part of the seventeenth century until its navigation was impeded by the construction of numerous dams at the end of the first third of the nineteenth century, and superseded by the superior means supplied by the Illinois and Michigan Canal.

Eight reports of Government engineers, however, declare that the portion of the river here in question is the most natural and available channel for a deep waterway connection between the Sanitary and Ship Canal and the Mississippi River, a project for completing the inland deep waterway connection between the Gulf of St. Lawrence and the Gulf of Mexico, which has been tenaciously adhered to by the Government of the United States and the State of Illinois for nearly a century.

The State of Illinois has spent over $63,000,000 for the dual purpose, as declared in the resolution of its legislature in 1889, of furnishing sanitary drainage and constructing a link in the projected ship canal. It has completed the ship canal as far as Joliet, where it joins with the portion of Desplaines in question.

The State of Illinois has appropriated $20,000,000 for the extension of the waterway through the strip in question and down to La Salle. The water power in question had no value prior to the expenditures by the State, but appellant, who had no ownership of the land until six years after the waters of Lake Michigan had been turned into the river, insists that the improvement carried out

shall insure solely to its benefit and the benefit of other riparian owners.

It contends that if not permitted to control the situation and allowed to proceed without legislative authority and without applying to the Government for permission the public will probably "lose the greatest benefits which nature has placed within their reach for years to come."

The answer to that contention is that, as decided in *United States* v. *Chandler-Dunbar Co.*, 229 U. S. 53, the manner in which water power on a navigable stream shall be developed and controlled is within the power of the Government of the United States; also the answer to the contention that the erection of a dam would be in aid of the Government's plans and in the interest of navigation, the language of the court, quoting from a former decision at page 73, is pertinent here:

> But if in the erection of a public dam for a recognized public purpose there is necessarily produced a surplus of water, which may properly be used for manufacturing purposes, there is no sound reason why the State may not retain to itself the power of controlling or disposing of such water as an incident of its right to make such improvement. Indeed, it might become very necessary to retain the disposition of it in its own hands, in order to preserve at all times a sufficient supply for the purposes of navigation. If the riparian owners were allowed to tap the pond at different places and draw

> off the water for their own use, serious consequences might arise, not only in connection with the public demand for the purposes of navigation, but between the riparian owners themselves, as to the proper proportion each was entitled to draw.

The importance of the Chicago-Desplaines-Illinois route, navigated as it was for over a century and a half as a connection between the Mississippi and the Great Lakes, and forming with them the greatest inland waterway in all the world, is sufficiently evident from the record here presented; and it is evident that the activities of the appellant have delayed the completion of deep waterway navigation for a period of at least eleven years. The increased cost of the improvement of this navigation due to this delay need not be dwelt on.

It is respectfully submitted that the navigable character of the water in question amply appears, that there is no error in the record, and the judgment of the Court of Appeals should be affirmed.

CLARENCE N. GOODWIN,
Special Assistant to the Attorney General.

WILLIAM L. FRIERSON,
Solicitor General.

NOVEMBER, 1920.

APPENDIX.

Government Plans for Waterway Improvements.

By M. L. Feiser.

Development of inland water transportation through the Council of National Defense's committee on inland waterways, which is receiving the fullest cooperation of the war department's board of engineers for rivers and harbors and of the department of commerce, opens to commercial power boats a field, the extent of which no one dares guess. This development is being brought about by the tremendous amount of inland shipping that is swamping the railroads and such river craft as have taken advantage of the opportunity.

Railroads, by one means or another, have done all they could in the past to stifle inland water traffic until it fell away off, but now they find themselves unable to cope with the transportation demands brought about by war, particularly that of the freight traffic, and have, by this admission, practically appealed for help. With the demand coming from many European nations for railroad equipment and the railroads of this country making the same appeal, plants devoted to supplying these needs find themselves with really more than they can do.

This leaves but one course open, and the Government, forced by the war to recognition of the actual state of affairs, has turned part of its attention to utilization of inland waters and the craft that ply them. That is why the department of commerce has sent Walker Parker, secretary of the New Orleans Association of Commerce, as a special assistant to Secretary Redfield on a special tour of lower Mississippi River and its tributaries to study the transportation needs of those waters.

But long before Mr. Parker will be ready to make a complete report much information will have been added to the data United States Army engineers are already compiling. Mr. Parker is collaborating with the defense council's inland water committee, of which Brig. Gen. William M. Black, Chief of Engineers, is chairman and Col. Charles Keller, secretary, but the situation has been grasped by the Army engineers and already they have made much progress to show what must be done to solve the transportation problem.

> Our plans for the development of these waterways do not include actual details as to power boats, but they do include details which should make the small commercial craft very vital to the whole scheme, Colonel Keller says. "Impetus given the movement to increase inland water traffic will naturally offer the development of power boats. We already know, and will find conclusively, that river boats, particularly of the large, freight-handling type, can make

none but economical stops along a given river route. This plan leaves out many smaller points, and many small streams, which still must be served. The only way to reach these is by power craft which will convey freight to the nearest large wharving point, transfer its cargo and pick up other freight destined for its home docks. Such a scheme will have to be followed for proper utilization of our rivers.

GOVERNMENT INVESTIGATING CONDITIONS.

Colonel Keller said the committee is already investigating such inland water routes as the New York State barge canal system, the Atlantic intercostal system, and the Mississippi and Ohio Rivers. The commmittee is trying to find how much and by what means transportation is now being carried on on these waters, the amount of the floating plant, and what conditions work for or militate against further development. It is also trying to find what advantages this transportation offers shippers, what water carries are idle now and their number, capacity, description and availability for future use.

OPPORTUNITY FOR SMALL POWER BOATS.

Small craft, particularly commercial power boats, have the opportunity of now going ahead on their own initiative and creating actual needs for larger river vessels and more adequate service, Colonel Keller intimated. However railroads may have treated water transportation in the past, they are lending a hand here now, Colonel Keller says, because, he stated, Daniel Willard, who is

in charge of the transportation division of the advisory commission of the Council of National Defense, has seen to it that the railroads cooperate in moving river traffic.

As Colonel Keller says, there is much that must be done and power boats have the opportunity to do much of it. General Black and Colonel Keller are willing and anxious to do what they can to aid anyone looking to the solution of the inland water transportation problem, and can be reached at Room 122, War Department, State, War and Navy Building, Washington, D. C., headquarters of the committee. Since organization of the committee, as published in August Power Boating, R. A. C. Smith, dock commissioner of New York City, has been added.

(Power Boating, September, 1917, p. 51.)

The Honorable Joseph E. Randsdell, of Louisiana in addressing the Senate September 29, 1917, on the use of waterways a war necessity, said:

> In the official report on "Transportation by Water," published by the Census Bureau for 1906, attention is called to the fact there were a very large number of small boats regularly employed and carrying in the aggregate a large and increasing traffic for which no statistics were gathered. *Every one in the least familiar with the facts knows that the number of motor boats now in use is enormously greater than in 1906. I have been told that there are more than 1,000 on one waterway in my own State of Louisiana—the Bayou Terrebonne.* Besides those who carry freight as a business there are large numbers of farmers who use motor boats to carry their produce to market and bring home their supplies.

In short, Mr. President, the water roads are being used in the same ways as the wagon roads; every one knows that the traffic in both cases is very large, but it is a practical impossibility to get a statement of the amount. It will be seen, therefore, that the duplications in these tables are largely, if not entirely, offset by the unavoidable omissions, making the totals approximately correct.

It is entirely natural, I suppose, that our attention should be attracted to the traffic handled in the great ports and on the great waterways of the country, but we must not overlook the fact that the smaller waterways and harbors, which are scattered all over our vast territory, and which, therefore, contribute to the development and prosperity of every part of the United States, carry a traffic which in the aggregate is enormous, both in volume and in value. It is shown by the tables, which I have asked permission to insert in the record, that there are 289 waterways and harbors which in 1915 carried less than 100,000 tons each, and that the total amount of freight was 8,316,820 tons, valued at $252,968,679. What these figures really mean will be more clearly understood when I say that they are practically equal to the combined tonnage handled by Portland, Me., New Bedford and Fall River, Mass., and New London and New Haven, Conn., and to the aggregate value of the commerce of the six lake cities of Ashland, Marquette, Milwaukee, Toledo, Sandusky, and Conneaut.

And in closing he said:

Transportation is important in time of peace; it is absolutely vital in time of war.

Indeed, Secretary Baker says, and truly, "This is a war of transportation." Because our railroads are overtaxed it may depend upon our waterways whether our flag shall float in victory or go down in disaster and defeat. It follows, therefore, that every one who promotes the improvement, maintenance, and utilization of our waterways is helping to win the war, while one who takes the other course is imperiling the safety of the Nation and the future of civilization.

Bulletin of the U. S. Department of Agriculture
No. 74.

Inland Boat Service: Freight Rates on Farm Products and Time of Transit on Inland Waterways in the United States.

[By Frank Andrews, Chief, Division of Crop Records.]

RELATIVE IMPORTANCE OF RIVER TRAFFIC.

The relative importance of receipts by river as compared with the total receipts by rail and water of various farm products at leading river ports is shown in Table 1. A considerable fraction of the wheat and corn received at Baltimore, Md., comes from landings along rivers which are tributary to Chesapeake Bay and is carried partly by steamboats and partly by sail vessels. During the five years ending with 1912 these receipts by water at Baltimore ranged from 10 to nearly 30 per cent of

the total receipts of wheat and from 3 to nearly 15 per cent of the total receipts of corn.

Cincinnati, Ohio, also has a large river trade in some products, notably tobacco.

One of the principal items in the freight received at St. Louis by boat is apples, which are brought in large quantities from Calhoun County, Ill. This county, consisting of a long strip of land bounded on three sides by the Mississippi and Illinois Rivers, has no railroads and depends upon river boats for transportation. In 1911, 54 per cent of the barreled apples received at St. Louis came by river, and in 1912 the river receipts exceeded 49 per cent of the total receipts by all routes. Also, from 2 to 5 per cent of the eggs, from 4 to nearly 7 per cent of the cotton, from 1½ to 2 per cent of the sheep, and from 2½ to 3½ per cent of the hogs received at the city in 1908–1912 came by water.

Statistics of river trade at Memphis and New Orleans show relatively large receipts of cotton At Memphis during the five years ending with 1912 from 10 to nearly 14 per cent, and at New Orleans from nearly 4 to more than 7 per cent of all cotton received was carried by boat.

MARKET VALUES OF PRODUCTS TRANSPORTED BY BOAT.

Another basis of estimating the importance of steamboat traffic is the market value of products carried. The following approximate valuations are based upon average market prices at the respective cities where the produce was received, and are to be regarded merely as rough estimates. The wheat received by boat at Baltimore during

the five years ending with 1912, at average prices of southern wheat, contract grade, was worth from $600,000 to $2,000,000 a year, and the corn receipts ranged from about $200,000 to $1,000,000, according to the prices paid for southern white corn.

At Cincinnati the receipts of tobacco by river averaged from $1,500,000 to more than $3,000,000 a year in 1908–1912; the cattle, hogs, and sheep were worth, at average prices, about $750,000 to $1,250,000 per year, while the eggs brought in by boat averaged $150,000 to $250,000.

Among the receipts at St. Louis during 1908–1912 whose value illustrates the importance of river traffic are apples, with an average annual value (disregarding the abnormally low receipts of apples in 1910) of about $125,000 to $775,000; eggs, worth $150,000 to $200,000 a year; cattle, sheep, and hogs, $1,500,000 to $2,000,000; and wheat, $200,000 to $500,000.

The annual receipts of cotton by river averaged $5,000,000 to $7,500,000 at Memphis and $3,000,000 to $7,000,000 at New Orleans in the five years just mentioned. Large quantities of other farm products were also received by river at these two cities.

* * * * * * *

SOME ADVANTAGES OF RIVER OVER RAIL.

Since the river is a public highway, there is an opportunity for competition among carriers which does not exist with rail traffic. In railroad business the roadway and terminals are regularly under the same management as the trains which use them, so that competition between two or more

arriers over a single railroad is not to be ex-
ected. The fact that the river is a public high-
ay makes it possible for persons of small capital
engage in transportation. Consequently sail
essels, *gasoline launches,* and small steamboats
mpete with larger boats for the traffic on many
land waterways. Sweet potatoes, watermelons,
ain and other commodities are brought into
ashington and Baltimore from points from 100
200 miles distant by means of *sail vessels and*
wer boats. A considerable part of the produce
ld at New Orleans is brought there by small
ats, and on the river system opening into San
ancisco Bay *gasoline launches,* sailboats, and
ner small vessels also share with the regular
amboat lines in the carrying trade. *The oppor-*
nity offered to persons or companies of small
pital to engage in transportation is one of the
vantages of river over rail. These public water-
ys are used also by farmers to transport their
n produce to market.

Another advantage of the river is the *economy*
sible in a large part of the traffic, especially
ere relatively nonperishable articles are carried.
e capacity of a boat can be increased or dimin-
d greatly by attaching or detaching barges, so
a large load can be moved at a relatively low
. In a large part of its business a boat can
k much more cheaply than a railroad.

With the Bread Winners at New Orleans.

REMARKABLE CHANGE IN RIVER COMMERCE SINCE GAS ENGINES CAME—PADDLE-WHEEL STEAMERS GIVING WAY TO GAS-PROPELLED TUNNEL BOATS—POWER WORK BOATS BRING COST OF LIVING DOWN.

[By Ramon Jurado.]

The past year has seen a remarkable change in the type of power work boats in and around New Orleans. A decade or more ago, when the internal combustion engine began to replace the heavier and more costly steam plants in the smaller boats running from the Crescent City into interior Louisiana, Mississippi, Alabama, Arkansas, and eastern Texas, the stern-wheel packet idea persisted, and the gasoline freight or passenger-carrying boat was of the same type as the steamer it displaced. The heavy paddle wheel, shoving the boat ahead, crashed through the weeds of the inland bayous, or scraped over the bars of rivers and bays without more damage than a loosened wooden bar or two. The open propeller, on the other hand, entangled itself in a mass of vegetation, in the undeveloped bayous, or bent itself into useless curves and loops on the unexpected sand bars, and at low tide on the mud flats.

Then came the tunnel-stern boat, solving the water weed and the sandbar problem, and replacing, among the more progressive freighters and passenger-carriers, the stern-wheeler. A few of the old packet-like power boats remained and still ply their way to remoted settlements of the interior or to the fishing villages around the mouth of the Mississippi, but their lack of speed

and the difficulty of handling them have gradually driven almost all of the stern-wheelers from the field in favor of the screw-boats, as most of the old-time river men call the newer type of power craft. To-day the tunnel-stern combination boats, carrying freight on the lower deck and in the shallow hold and passengers on the upper deck, are being replaced by self-propelled barges to carry the freight and by craft closely approaching the cabin cruiser for the passenger trade.

Improvement of inland waterways has shown that the barge which carries its own motive power, though slower than the smaller power freighters, carries from three to ten times as much freight at approximately the same cost, and in some instances much less, than the combination boats. The barge also, being wider, longer, and of greater cargo space, draws less water than the more pretentious passenger-freight boats and, furthermore, requires at least one less in the number of the crew necessary to operate it.

These barges, which are being built to handle rice, sugar, lumber, and other commodities from remote inland points to shipside or railroad depot in New Orleans, are not sprung from the big steel barges which are being tried out on the Mississippi River in interstate trade nor to those small but similar craft which have made a success of carrying coal and iron from the Alabama fields to New Orleans. *The new barges are of wood, simply and cheaply built, some of them less than 50 feet in length, though plans for the most of those building and to be built call for craft of at least 100 feet long.*

Ungainly and far from beautiful, they depend for their existence on the development of inland waterways and the consequent necessity for cheap and capable freight transportation thereon. They appear to offer a reasonable solution for the car shortage and freight congestion problems which have done so much to retard the commerce of the lower Mississippi Valley during the past year.

Opening of inland waterways and the development of farming lands and settlements on their banks, likewise, has led to a demand from the people living in those sections for better transportation to and from their homes. Approximately 9,000,000 acres of fertile lands are being opened along the rivers, bayous, and canals of Louisiana this year; the people who are living on these lands are producing bumper crops and receiving top prices for them. If the condition of the roads is such that they can not have automobiles, and suitable train service does not reach them, they demand modern, convenient, and fast power-boat accommodations between their homes and the towns and cities they frequent on business or pleasure.

The result of this has been within the last year that a new class of passenger-carrying power boat has come into demand in this section of the South. The people no longer will ride on sacks of rice or sugar or above smelling piles of moss or palmetto fibre, nor will they loiter along good waterways at six or seven miles an hour when on the lake and river they see large passenger cruisers doing fifteen to eighteen. Hence the demand for

large cruisers, long and broad of beam but shallow of draught, which can bring one in eight hours from the mouth of the river to New Orleans or carry one across the lake at better speed than the lake steamers make.

These boats and the freight barges are bringing the agricultural territory of three States closer to New Orleans than anything else which has appeared since the introduction of the internal combustion engine, though, naturally enough, their success and growth depend on the development and improvement of inland waterways.

A TYPICAL MISSISSIPPI FREIGHT BARGE.

Of the freight barges a typical example is nearing completion for the Southern Transportation Co., in the yards of J. D. L. Mullen, on the Bayou St. John. This unwieldy appearing craft is 115 feet long, 29-foot beam, about 6 feet deep in the hold, *and draws 26 inches of water,* loaded. Her 44-inch propeller is driven by a Kenner 100-horsepower gasoline engine, and she will make six to seven miles an hour. Her capacity is *200 tons net,* and she is electrically lighted from a separate plant. She will be used for general cargo work on the river, Lake Ponchartrain, and the canals. *She is intended to be the first of a fleet of similar barges, of carrying sizes, for use in handling rice and sugar from the inland parishes to tidewater at New Orleans.*

Of the new passenger carriers, that type which provides quarters for the passengers above decks, with awnings for shelter, rather than the stuffy staterooms offered by the packet-type boats, is the

most in demand. This is an adaptation of the larger pleasure boat, of the type, for instance, of *Cavalier,* the 75 x 15-foot hunting and fishing boat belonging to Victor Camors, of New Orleans. The writer has seen her coming from the South Draw, across Lake Ponchartrain, a bitter northwester pounding her on the nose, yet never deviating from her 13-mile gait, with which she entered the draw and with which she had been coming up the Sound. For reasons of economy, these new passenger power craft, while planned along general lines similar to *Cavalier,* are being built in *50–60 foot lengths, with proportionate other measurements,* and greatly reduced power plants, owing largely to the fact that most of their running is to be in quiet waters.

The low cost of operation of the self-driven barges on southern waters may be gathered from perusal of the data gathered by the Alabama and New Orleans Transportation Company, which has been operating six of these craft between the Alabama coal and iron fields and New Orleans for something like three years. While these barges are larger and more costly to operate than the smaller craft intended for inland waterways, a fair idea of what the cost of running the new-style wooden barges will be can be obtained by comparison. No figures, of course, are available as to the wooden barges intended for local operation.

The Alabama and New Orleans Company is operating six barges, three of them 200 feet long, 32-foot beam, and 8.5 feet deep; two 220 x 32 x 8.5 feet, and one 240 x 32 x 8.5 feet. Each of these barges is driven by two 75-horsepower Fairbanks-

Morse engines, using gas produced on board from breeze coke. These engines turn two 52-inch propellers on each barge, and drive as well a 5-kilowatt generator for searchlights, lighting, interior telephones, controls, etc. Cost of the coke for each barge is approximately $25 a week of seven days. Each barge averages about 800 miles weekly, which brings the fuel cost down to a trifle more than 3 cents a mile. Labor cost per week is $125 for each barge. The round trip from New Orleans to the Alabama coal fields is almost exactly 1,200 miles. The barges are always loaded coming in from Alabama, and carry good cargoes of merchandise on the return trips. The three smaller barges can handle 725 tons of coal each; the two larger, 825 tons, and the one 240-footer, 925 tons.

So successful have been the operation of these barges that the Inland Navigation Company, which has a larger self-propelled barge operating between New Orleans and St. Louis, on the Mississippi River, has ordered two steel barges of the 240-foot size of steel barges from the Alabama and New Orleans Transportation Company's yards at Violet, La. These new barges are being equipped with three Fairbanks-Morse oil engines, of the semi-Diesel type, each engine developing 100 horsepower. They will be completed in September and will be put immediately on the run between New Orleans and St. Louis, or possibly, more northern ports.

The wooden inland waterways barges, however, with their 100 or 200 ton capacities, and necessarily shallow draught of 2 feet or less, can not compare with these huge steel power boats, though it is prob-

able that they will develop a business which, in the aggregate tonnage and in aggregate assistance to the sections they visit, will be as great as, if not greater than, that afforded by the larger self-propelled craft.

Some of the old-time freight and passenger carriers, however, are still active, popular, and making money. Among these is El Rito, one of the largest gasoline workboats in New Orleans, which belongs to the Spicuzza Bros. Transportation Company, and carries passengers and general cargo into the Barataria section, bringing back rice and other products of the swamps. She is about 100 feet long and equipped with a 100-horsepower Fairbanks-Morse gasoline engine, with separate plant for electric lighting. Her upper deck is provided with staterooms for passengers, and the lower is left open for freight. El Rito was one of the first boats on the river to be operated by an internal combustion engine, and has been running steadily ever since she was first put into commission. Few inland waterways boats have made so much money for their owners as has this clumsy looking but reliable old-timer.

OIL-DRIVEN TUGS BECOMING POPULAR

Gasoline or oil-driven tugs also are becoming more and more popular in New Orleans harbor and on Lake Pontchartrain. One of the strongest and best known of these is Tiger, properly of the Jahncke Construction Company, which handles heavy barges of sand, schooners filled with clamshells, and other schooners laden with lumber, with equal facility. Tiger is 75 feet long, 15-foot beam, and draws about 4 feet of water. She is equipped

with a 75-horsepower Wolverine engine, and is considered one of the best, if not the best, power tug in the port.

The new patrol boat of the Southern Yacht Club also is built somewhat after the manner of a tug, and has much of the work of a tug to perform in towing disabled cruisers to safety, racing schooners, machine sloops, and other sailing craft to the starting lines of races, and various similar work about the clubhouse at West End. This patrol boat is 36 feet long over all, with a beam of 9 feet, and is driven by a 15-horsepower heavy-duty Sterling engine, giving a speed of about nine miles an hour.

One of the most important classes of work boats not only in New Orleans but all along the gulf coast is that which carries the fish, oysters, shrimp and other sea foods to the market. Their importance has increased enormously since the beginning of the war, because, by the aid of the gasoline engine, they are able to add largely to the food supply of all the gulf States, while they make so much faster and more frequent trips from the fishing grounds under power than they did in the old days under sail that prices of this class of food have risen very little in proportion to those of other necessities of life. Thus, the gasoline engine has been a big factor in keeping down the high cost of living in the further south.

BOATS CUT HIGH COST OF LIVING.

New types of these boats also are creeping into the annually-growing fishing industry of the South, types which tend to greater speed and strength of hull, so that the cargo carrier, instead

of having to wait at the mouth of some river or bayou for the oyster tongers or the shrimp seiners or the fishermen to bring in their catches, can go out to sea, gather up the cargo without disturbing the work of the harvesters of the deep and then make 12 to 15 miles an hour against wind or tide back to market.

Of such as these are two boats, exactly similar in every detail, which have just been completed by Frank Maternolich, at his shipyard at Wolf River, Miss., and whose engines were installed by Arthur Duvic, of New Orleans. One of these is North Star, built for Captain Bassao, of New Orleans, and the other New Champion, built for Mreo Sumich, also of New Orleans. A description of one will serve for both.

Length, 60 feet; beam, 18 feet; draft, 4 feet. Equipped with 40-horsepower Frisco Standard engine, make-and-break ignition, separate lighting plant. The propeller is 42 inches in diameter, and, at a working speed of 12 miles an hour, the power plant will consume five gallons of oil or gasoline an hour, the engine using either fuel. The boats are of the fan-tail type, heavily built for all weathers, and cost $6,000 each. Their work will be carrying oysters, of which they have a capacity of 500 sacks—nearly 25 tons—from Louisiana Marsh to New Orleans, a distance of 110 miles.

Four men operate each boat, which must make two round trips between New Orleans and the marsh, each week. Thus their average mileage will be 500 per week; they must be out in all weathers, sometimes on the open sea, often over the marsh, and again in the river. They also aid

in dredging, while waiting for cargoes at the outer edge of the marsh. No class of work boats in the South are more strenuously used than these seafood gatherers, and none have to be built so sturdily or so well.

A similar boat, but of smaller size, is Dante, built at the same shipyards, also for Captain Bassao, of New Orleans, for the same sort of work. This boat is 40 x 14 feet, with 3-foot draught. Her power plant consists of a 20-horsepower Frisco Standard engine, installed by Arthur Duvic, of New Orleans, with make-and-break ignition system and electric light plant. Nine to ten miles an hour is produced by the 34-inch propeller, and oil or gasoline may be used for the engines, whose consumption is placed at about 3½ gallons an hour. Dante's work will be the same as that of North Star and New Champion—carrying oysters from Louisiana Marsh to New Orleans. Her capacity is 250 sacks of oysters, approximately 12 tons, and three men will handle her through her 500 miles of travel every week. Dante cost, in round figures, about $4,500. An interesting commentary on the value of these working power craft is that the owners estimate each one of them will pay for herself in six months, besides paying all expenses of the owner and crew.

Like the oystermen, the shrimp trawlers are beginning to see the advantages of this new type of boat, and are slowly abandoning the old auxiliaries—most of them merely rebuilt luggers with an engine installed—in favor of the faster gasoline boats. One of the latest of these is Peerless, built for Ole Thompson, of Biloxi, and equipped

by Arthur Duvic with a 22-24-horsepower Peerless coal oil engine, which consumes 2½ gallons of oil an hour. Peerless is 35 feet long, 10-foot beam, and draws 2.5 feet of water, so that she can pass with ease over the tide-filled mud flats where the shrimp are most plentiful. She will serve not only to trawl for the shrimp over these flats, but to carry them to market, 110 miles away, at New Orleans, for this boat is to work, also, in the Louisiana Marsh, though her owner's headquarters nominally are at Biloxi. Her capacity is 200 baskets—about 10 tons—of shrimp, and she will make 10 miles an hour, loaded. Her crew consists of four men, one more than necessary, inasmuch as all must work at trawling as well as operating the boat. Peerless is driven by a 28-inch propeller, and has her own electric lighting plant.

An interesting pioneer in this field, slightly different from either of the three just described, yet far in advance of the old auxiliary luggers, is Althea, which, for some years, has been used as an oyster and fish runner between the lower river and the market of New Orleans. The great discrepancy in this type of boat is speed, few of Althea's class being able to make more than seven or eight miles an hour, and the majority about six. The new boats, with increased speed and greater carrying capacity, should tend to hold down even more closely the cost of sea products, one of the most important factors in the food situation at New Orleans.

AUXILIARY SCHOONERS BUILDING IN THE SOUTH.

Improvement is being made, too, in the big auxiliary schooners along the Gulf coast. Re-

cently, at Biloxi, a regatta was held in which the schooner race was the most popular affair of the entire two-day meeting. From these schooners have grown the big four and five masted auxiliaries which have been built in numbers at Gulfport, Miss.; Orange, Texas; and Lake Charles, La., to carry lumber across the Atlantic and to Central America. Some of these auxiliaries cost as much as a steam freighter, one launched at Orange, Texas, recently, being valued at $300,000, and another at Gulfport, Miss., at $220,000. Both these schooners were more than 200 feet in length, were equipped with oil engines, and were of approximately 1,000 tons carrying capacity. Others of similar type are building at Lake Charles, La.; Pascagoula, Miss.; Mobile, Ala.; and Pensacola, Fla.

Gasoline-driven harbor boats, messengers, carriers of labor, water tenders and similar craft are increasing in New Orleans harbor. The latest addition to this port fleet is George S., built by the J. D. L. Mullen shipyard for George S. Schwartz, a stevedore. This boat is to be used carrying gangs of men from shore to ship and back. She is 40 feet long, 9-foot beam, and draws 2½ feet of water. She was equipped by Arthur Duvic with a 25-horsepower auto-marine Buffalo engine, turning a 22-inch propeller to produce a speed of 12 miles an hour. The ignition outfit is of the make-and-break type, and electricity is provided by a dynamo on board. Gasoline is the fuel used and 2½ gallons is consumed for every hour's run. The boat is of the hunting cabin type and requires only one man to run her. She cost $2,000 and was built in three weeks. This is the

second of these harbor boats to be put into service in New Orleans in three months.

Government boats also have been outfitted extensively in New Orleans and at Plaquemine by the Duvic Company of the Crescent City. One of the most interesting of these was a sea-going mine layer, 90 feet long, 22-foot beam, into which was put an 87-110 horsepower Frisco Standard, to drive a 54-inch propeller, produce electricity for lighting and searchlights and similar uses. The fuel to be used in this boat, whose name, obviously, can not be given, is gas distillate, and she is to have a guaranteed speed of 12 miles an hour. The boat, which was built by Thomas Favre, of Gulfport, Miss., looks like a small steamer and is intended for use in any kind of weather in whatever sea may arise.

At Plaquemine, also, is building another large boat for the Government surveyors and engineers. This craft is to be 65 feet long by 22-foot beam, and of shallow draught, so that she pass with ease over the flooded lands or into and out of the shallow bayous and bays. Mr. Duvic is installing in this boat a 65-horsepower Frisco Standard engine, to use gas distillate and to give the craft a speed of about 10 miles an hour. Peculiar conditions surrounded the installation of this power plant, inasmuch as it must be so geared and controlled that the boat can be slowed to any speed, even as low as one mile an hour, for the convenience of the surveyors who are working from her deck. This was accomplished, however, by various gears, each easily operated by the engineer on signal.

GOVERNMENT ORDERS POWER TUGS.

Eight power tugs also are to be built for the Government at Plaquemine, with engines to be installed by Mr. Duvic. These tugs will be of varying sizes and will be equipped with 20, 30, and 40 horsepower Frisco Standards, using gas distillate for fuel. Further details regarding these craft are unavailable for publication at present.

Kildeer, a 40 x 15-foot canopy launch for the use of the Federal quarantine station, has been received in New Orleans from Philadelphia. A 30-horsepower Frisco Standard was installed in her in New Orleans by the Duvic Company, and the boat, which will be used to visit ships from quarantine and similar work, has been accepted.

The lighthouse service is having built at the Algiers naval station five boats, 21 x 5½ feet, of the dory type, to be equipped with five-horsepower Fay & Bowen gasoline engines. These boats will be used at the lighthouses around the shores of the Gulf.

Users of heavy-duty power boats, whether they be for pleasure or for work, in these southern waters, have found that the speedy type of larger craft, say from 40 to 100 feet, fail to furnish the comfort needed for pleasure parties or the space and stability called for in passenger or freight carriers. The result has been the turning to a type embodied in Frisco Standard, a fishing and hunting boat recently built for Arthur Duvic by J. F. Dupre, of New Orleans. This boat, of the trunk cabin type, is intended to be used both for pleasure and for work and to combine both with the maximum amount of comfort obtainable.

Frisco Standard is 35 feet long, 9-foot beam, and draws 34 inches of water. It is equipped with a 12-15 horsepower Frisco Standard engine, which drives a 28-inch propeller so as to give the craft a speed of 9.5 miles an hour. Gasoline is used for fuel at the rate of 1½ gallons an hour, and the boat is electrically lighted and controlled, the current being made with a dynamo on board. This new boat is now at the summer home of her owner at Biloxi.

The result of all this increases the use of power boats in and around New Orleans and seems to be a sort of crystallization into specialized types for the work to be done. The coming of the war seems to have fixed permanently the place of the large auxiliary in the world's commerce, but the smaller schooner with the "kicker" commonly used for many years in the fishing industry apparently is slowly but surely giving place to the faster, more compact, more reliable, and heavier laden power boat built especially to carry sea products to the market.

The development of inland waterways, and the settlement of great farming tracts hitherto covered by swamps or forest, has led, as has been shown, to a demand for improved freight and passenger-carrying service. This has brought, as the most adaptable type of passenger carrier, the modern cruiser, of shallow draught, with most of below decks given to engine room, and the passengers riding above under the canvas top. *For the freighter, the shallow, self-driven barge, cheap but strong in construction, seems to be the last word. Secretary Redfield is now in the South, investigating the waterways situation.*

[Power Boating, Sept., 1917.]

Boats That "Eat Up" Shallow Water.

[By E. C. Bryan.]

There are many thousands of miles of shallow streams and lakes in this country, now navigated only by punts and skiffs, upon which a power-driven boat would be welcome if it could be employed.

The problem of designing a shoal draft hull is not difficult: the familiar scow is an example. When, however, it has been sought to apply power for propulsion, complications and difficulties have been met. They have been in some measure overcome by stern wheels, side wheels, aerial propellers, and water jets. All of these have objectionable features, noise, dirt, vibration, weight, wear and tear, and high first cost have prohibited their employment in small craft of any kind, in family launches, cruisers, or in the smaller work boats. The submerged screw propeller is the favored and most efficient mover of water-borne craft, and its application to the driving of hulls in shallow waters is the only method by which the demand for efficient power boats for recreation and pleasure or business upon such waters can be met. It is well known that the draft of the normal modern motor boat is not in the hull itself. *The diameter of an efficient propeller submerged a proper distance below the convex keel is the thing which demands the depth of water. The propeller must be submerged. The rare instances in which partially submerged propellers are being used are not in the province of this article. How to submerge the propeller*

and at the same time lessen the draft is the problem which was solved by the invention and development of the tunnel stern.

This type of boat will be a tremendous factor in opening up an immense undeveloped area of lakes and rivers to power boating. They have been regarded only as a deformed skiff or punt. The fact is that every line of grace and beauty possible in any boat can be reproduced in them. Their use is not confined to shallow waters, as they have been found unexcelled in such waters as Lake St. Clair and the Detroit River at their roughest stage. So far as speed is concerned, the open boats of the present type have nothing on them. To illustrate, the Bryan Boat Works at Wyandotte, Mich., have one which they built, a 20 feet by 4 feet 6 inches, powered with a Kermath 12 H. P. It gives them 14 miles per hour. Anything of the same size doing as well is considered a smart boat. We've chugged up a little Canadian river with this boat until we came to parts so narrow that we had to climb overboard and lift the bow around to retrace: The natives, like the countryman at the circus who exclaimed as he looked upon the giraffe, "taint so; there ain't no sech animil," seemed to doubt the evidences of their eyes and refused to accept as a boat a craft which paddled around in waters theretofore navigated by nothing drawing more water than a coot.

The tunnel is a concavity which is formed by the up bending of the keel ribends and planking of the after under body.

The extent of the up bending is determined by the diameter of the propeller, and this by the character of the power employed.

The average depth of the propeller is 2/3 of its diameter, thus in a 45-foot cruiser, powered with a 24 H. P. heavy duty motor turning a 30-inch propeller. Seventy inches of water is required for its turning, and the 25-foot open launch driven by a motor turning a 16-inch wheel is successfully navigated in 12 inches of water. The propeller, however, is not the only factor in determining the area and form of the tunnel. The forward slope must not be too steep or the resulting drag will impair the efficiency of the wheel, and the after slope must be of such form as will alow a ready clearance of the water thrust off by the propeller and moved by the stream lines.

The designing of the entrance, providing for an easy run, estimating the displacement and trim, and giving the boat the ample initial stability which is such a valuable, but too often illy handled factor in small boats, are all problems especially important in tunnel stern design.

There is no reason why the tunnel stern launch or cruiser should not be an excellent sea boat. Such craft are capable of splendid performance under most trying circumstances.

[Open Exhaust, Feb., 1914.]

Motor Craft of Chesapeake Bay.

[By Stuart Stevens Scott.]

The Chesapeake region, that area of tidewater land along Chesapeake Bay which divides the State of Maryland and penetrates deep into Virginia, has felt the influence of the commercial

motor boat as have a few other sections of this country. This may seem a bold statement, and yet statistics will go a long way toward proving it, while even a brief visit will give an optical demonstration.

* * * * *

Prior to the gasoline engine the farmers of tidewater land had sailing craft to depend upon for carrying grain and such cargoes as would not be injured if delayed in transit. Only the farmers close to steamboat wharves could hope to send produce to the cities of Norfolk and Baltimore, and even then in limited quantities, for freight rates were high and steamboat schedules were such as to make the sending of produce risky.

* * * * *

Tidewater Maryland and Virginia have been regenerated. To-day the Chesapeake region is a garden spot. Great truck-patches have taken the place of countless acres of virgin forest and old farms, and it is all due to the gasoline-propelled craft that chug in an endless procession.

Few, indeed, are the farmers of the Chesapeake region who do not own a motor boat, not as a pleasure craft but as an adjunct. In a region so interspersed with streams as to make a boat almost as necessary as a horse and carriage, it is but natural that the people are only too glad to avail themselves of a cheap means of transportation over the liquid highways.

The best evidence of their willingness is that there are within the Chesapeake region fully 10,000 motor boats, and of these, it is safe to say, 80 per cent are used for business purposes.

* * * * *

I said there were fully 10,000 commercial motor boats in the Chesapeake region. I have before me a letter from the Department of Commerce, dated March 18, which reads:

"In reference to the request for the number of boats in the Chesapeake region, this office advises you that the number of motor boats documented on June 30, 1912, at the several ports from Washington, D. C., to Cape Charles, inclusive, were as follows: 14 motor boats over 50 tons; 587 motor boats over 5 tons; 9,148 motor boats under 5 tons.

"All of these motor boats, with the exception of those under 5 tons, are in commercial use. The 9,148 motor boats under 5 tons include yachts and vessels in commercial use."

The above figures give a total of 9,749 craft a year ago. With the natural increase, and taking it for granted that some were missed in the tally, the round number of 10,000 is not far wrong.

(National Waterways, July, 1913, p. 419.)

See "Power Boating's Prize Workboat Design," Power Boating, March, 1918, for design of power work boat 60′ x 16′, with displacement of only eighteen inches, 42,000 pounds; deadweight, 25,000 pounds.

[Motor Boat, Oct. 10, 1918, p. 48.]

"An Interesting Air-Propelled Motor Boat."

The use of air propellers is becoming more general. The navigation of very shallow streams, and of waterways infested with weeds, is made possible with hulls which draw only a few inches

and which have air propellers in place of the submerged wheel.

One such boat is shown and described. "The main hull is 20 feet long and 37 inches wide, and is equipped with pontoons which prevent it from tipping over when making turns. We use an 80-horse power Gyro motor with an aerial propeller eight feet three inches in diameter. The entire weight is about 750 pounds. The main hull is 14 feet deep. *When running at from 40 to 60 miles an hour our main hull draws about an inch of water.*"

There are a good many air-propelled boats in service in this country on the shallow waters, but there is a much greater demand for these boats in South America. In Colombia, for instance, they have been used for the delivery of mail and other purposes.

The Present Aspect of the Mississippi River Problem.

[By Robert S. Taylor, of the Mississippi River Commission.]

* * * * *

"One further thought, not for its utility but its inspiration. The big dredge has a little brother lately come into the world but destined to work a mightly revolution in waterway transportation. It is the gasoline-motor freight propeller, scarcely larger than an automobile, with its little, flat, shallow scow—the cheapest craft ever floated, a mere box, satisfied with a foot and a half of water, pushed ahead or towed behind, and carrying a few tons of merchandise. It is a true

aquatic truck, scarcely more costly than a good team and land truck, and requiring only one man to own and run it. He is in truth

> * * * a cook and a captain bold,
> And a mate of the Nancy brig,
> And a bo'sen tight, and a midshipmite,
> And the crew of the captain's gig.

"This little craft has been coming into use lately on the bayous and small streams of the alluvial valley in increasing numbers. That we shall have in the future abundant supplies of fluid fuels and simple engines for using them is not to be doubted. We have been hearing for twenty-five years of the 15,000 miles of navigable channels of the Mississippi and its tributaries. We have taken it as an innocent exaggeration. But these little motor boats, between the Alleghenies and Rockies, and Canada and the Gulf will find all that and more. With their cousins on land next to come—the trolley freight lines, they will gather the productions of that great watershed into the hulls of its big boats as the Lord gathers its rainfall into the channels of its big rivers."

Conclusion 57

IN THE

Supreme Court of the United States

OCTOBER TERM, 1920.

ECONOMY LIGHT & POWER COMPANY, *Appellant*, *vs.* THE UNITED STATES OF AMERICA, *Appellee*.	No. 104.

May it Please the Court:

The argument under point III of the Government's brief beginning at page 154, as to the effect of the Acts of 1796 and 1804, confuses the issue. Counsel discuss their effect on streams "actually being navigated at the time of these enactments," and say that Congress "took advantage of the situation by making the perpetual character of the easement of navigation over the then navigable rivers certain and assured beyond any possibility of doubt or question" (Br., p. 156). No Act of Congress was needed to effect that purpose, as to rivers actually navigable within the definition laid down by this Court. If the Desplaines were navigable in that sense, neither counsel nor the Court of Appeals would have had to invoke those early Acts or the ordinance of 1787 to sustain the decree in this case. The Government must face this question: Can a river be held to be navigable under those early Acts of Congress and that ordinance, which would not be so held except for them? When counsel use the term "then navigable"—speaking with reference to the time of the early Acts—they mean, not navigable within any definition of navigable waterways of the United States, but streams

upon which hunters and explorers could, with whatever amount of difficulty, at times pass their small craft. But, as Mr. Justice Miller said in *Duluth Lumber Company vs. St. Louis Boom & Improvement*, 17 Fed. 419, when he held the St. Louis River to be non-navigable, "that has nothing to do with the great point of the navigability of streams of the United States concerning interstate navigation or international navigation." And in dealing with precisely the same contention as is put forward in this case by the Government, but in connection with a stream which had been much more extensively used, and in fact even by small steamboats, Mr. Justice Miller said:

"Something is said in this case about the organic law admitting the State into the Union; about the old Act for the Government of the Northwestern Territory. We have long ago decided that the original Act concerning the Northwestern Territory ceased to be of any force when Congress and the State chose to organize and admit the State into the Union. That ordinance, then, is of no force in such a State."

The cases of *Coyle vs. Oklahoma*, 221 U. S., 559, and *United States vs. Sandoval*, 231 U. S., 28, cited by counsel, we have dealt with in our original brief (pp. 53-54).

The case of *Ruddy vs. Rossi*, 248 U. S., 104, cited in the Government's brief, upholding Congressional restriction of alienation of homestead after the conveyance by the United States in fee simple has no application to the instant case. The contention of the Government here is that the United States might retain sovereign—not proprietary—rights in land included within a new State.

The contention is directly in the teeth of the Act of Cession of the State of Virginia, which ceded the Northwest Territory to the Union upon the express condition that the Territory so ceded should be laid out, and

formed, into States, and that the States so formed should be admitted members of the Federal Union "*having the same rights of sovereignty, freedom and independence as the other States.*" It further provided that the lands within the Territory so ceded (excepting certain lands appropriated for bounties to officers and soldiers of the army), should be considered as a common fund for the use and benefit of such of the United States as had, or should, become members of the Confederacy and should be faithfully disposed of for that purpose. Under this deed of Cession the United States had no power to reserve such an easement as is contended for. It had no such easement in unnavigable streams and carrying places in the old States, and the new States so created stood precisely, in that respect, on the same footing as the original States. It was not even competent for it to retain the title to the beds of navigable streams, ownership of the beds of such streams, above tidewater, being one of the sovereign rights of the original thirteen States. See cases cited in original brief, page 39.

I

As to the Government's analysis of the evidence

Appellee confuses the issue by asserting that appellant "rests its case upon the conclusions of the Supreme Court of Illinois, in a case to which the United States was not a party, and in effect ask the reversal of the District Court and the Court of Appeals on the ground that they do not harmonize with the conclusions of that court." Such is not our position. We consider that the opinion of the Supreme Court of Illinois should have great weight, assuming that the facts of both records are substantially the same, and we insist that they are substantially the same. In this we are sustained by the Court of Appeals.

The decision of that Court did not recognize that the difference was such as would warrant a different conclusion. In fact, in the opinion it was stated that:

> "The difference in the record in the two cases would not, perhaps, warrant a different conclusion, although the evidence here is somewhat stronger in favor of navigability than in that case. Taking as we do a different view as to the force and effect of the historical facts of the early use of the river, and being clear that it is in fact a navigable stream, we feel that we should follow our own views." (p. 3372, Abst.)

The different view which the Court of Appeals took from the Supreme Court of Illinois clearly appears in the opinion of the former court. It was its opinion that any stream which was valuable for floatage, or was used by traders or trappers, prior to the Ordinance of 1787, or the early Acts of Congress for the government of the territory, had by that Ordinance and those Acts been stamped with the character of navigability, which made them for all time navigable waterways of the United States. That view was not held by the Supreme Court of Illinois, and we think we have demonstrated its incorrectness in our original brief.

Counsel for the Government devote a very large, if not the larger part of their brief, to an effort to show material difference in the records of the two cases. They endeavor to get away from the conclusion of the Court of Appeals in that respect, and we think it is because they recognize that the legal deduction drawn by the Court of Appeals from the facts, as proved in both cases, cannot be sustained in law.

At pages 108 to 117 of our original brief we referred to

every instance of use, or attempted use, of the Desplaines River shown in the record in this case, which did not appear in the record in the State case. And, we showed that the additional matter was in the main a record of failures in the attempts to use that river. Counsel have, however, gone into analysis of the experiences of early explorers and traders upon that river, and have referred to many compilations by persons who had no familiarity with thevicinity in question. in the effort to show a general use of the Desplaines in early days. Although we insist that the statute under which this action was brought, refers to commerce, as that term is understood in modern times, and not to the experiments of such early voyagers, we still feel constrained to refer to counsel's analysis of that evidence for the purpose of showing that it is not accurate, and that many of the sources to which they refer prove that the Desplaines in its natural condition was not navigable in the sense that it could be generally used, even for the purposes of those early adventurers.

The conclusions of Dr. Thwaites and Prof. McLaughlin were based on extracts from various works submitted to them by the Government, which constituted part of the material collected and relied on, by Prof. Alvord. They made no independent study of the question. (See our original brief, p. 160.) Alvord had made an exhaustive study of the subject, for he had testified at great length in the State's case against this appellant, and had made a further investigation for the purpose of preparing himself to testify in the instant case. As an impartial historian, it was reasonably to be expected that when he gave excerpts from narratives he would not confine himself to such portions as seemed to aid the Government's case; that when he made, or used translations,

they would be correct translations; and that in dealing with compilations he would have used some effort to ascertain from what sources the information therein contained was obtained. He did none of these things. In his testimony he used excerpts from narratives to support conclusions which were wholly refuted by other portions of the same narratives, to which on his direct he did not refer. He used translations the inaccuracies of which had been pointed out by other historians, which inaccuracies concerned the questions at issue herein, and they effected the validity of his conclusions. He introduced like inaccurate translations made by himself. He knew of the existence of accurate translations which he did not use. He introduced, and relied on, preposterous statements to prove that the Desplaines had been navigated, such as that in Woodruff's History, which referred to steamboats plying the Desplaines to Chicago in 1878, which if true would have involved their climbing over dams and crossing dry land.

In our reply brief in the Court of Appeals, we called attention to this misuse of historical sources by Alvord, but Government's counsel in their brief here still adhere to statements made by him, which do not correctly represent the sources on which he relies, and which, if left unexplained, must necessarily mislead.

We will now, therefore, as briefly as possible, analyze Alvord's statements, the sources on which he relied, and counsel's synopsis of them.

The translation by Alvord of page 125, 2 Margry, in which is related La Salle's opinion of the Desplaines, is illustrative of his method. In the translation which he introduced on the direct appeared the following: "When ice is formed there is no longer water in the Chicago River." (Abst., 35.) The word "Chicago" here is ad-

mitted by all to refer to the Desplaines. Of course, the passage, as translated by Alvord, suggests lack of water in winter, the season when there is no navigation. As a matter of fact, and as admitted by Alvord on cross-examination, the meaning of the original instead of being "when ice is formed." is "when the ice is melted." (Abst., 296.)

In the same translation (Abst., 35) La Salle is made to say that in summer "there is not *enough* water in the river," while in fact he said "there is no water *at all* in the river." (Abst., 295.)

In the same translation as given on the direct appears the following: "The Chicago (Des Plaines) River is not even navigable for canoes except after flood." This appeared as an entire sentence. As a matter of fact it was an inaccurate version of the last part of a sentence. A correct translation of the phrase in which it appears is as follows:

> "and then if one should persist in this communication by means of ships, as they cannot navigate in the lakes before mid-April because of the ice and often even later, and because *never at this season nor afterwards the rest of the year*, is Chicago (Des Plaines) navigable even for canoes unless after *some storm*." (Abst., 296.)

Other erroneous translations of La Salle's narratives will be referred to herein later.

Further, the inaccuracy of Alvord's work, and the invalidity of his conclusions appears from many of his statements. For instance, upon the direct he introduced and construed the meaning of certain passages from a letter of La Salle's which he had translated, and he emphatically declared that in those passages La Salle was comparing the Kankakee and the Desplaines routes. He said

he based that conclusion upon an examination of the entire document, and considered the particular passage in relation to the whole contents. (Abst., 32-36.) He insisted upon this strenuously under cross-examination. As a matter of fact there was no reference in the document to the Kankakee. The portion of the letter which Alvord assumed referred to the Kankakee, clearly referred to a passage up the Ohio and the Wabash to Lake Erie. He admits this (Abst., 178-179) and says that he "should have glanced over the next page and would have seen that the river he referred to is by the Ohio."

The passage from Turner's "Character and Influence of the Indian Trade in Wisconsin," referred to by Prof. Alvord, does not mention the Desplaines River, and its reference to a *general route* whereby it was possible to reach the Mississippi from the Wisconsin country, as being "By the Chicago River to the Illinois" supports no inference as to the use of the Desplaines River itself as an avenue of trade and commerce. Prof. Alvord admits that pack horses were largely used throughout the west in the fur trade of the latter part of the 18th and the first part of the 19th centuries. (Abst., 267-268.) Hubbard, when he became superintendent of the American Fur Company, abandoned all attempts to use the Desplaines, and went to and from the Illinois with pack horses. Before 1820 wagons were used to transport boats from the Chicago to the Illinois (Abst., 116).

The excerpt from "The American Fur Trade in the Far West" by Chittenden, on which Alvord relies, likewise does not mention the Desplaines River, nor can it be any evidence of the use of that stream as a carrier of trade and commerce.

Counsel quote from Marquette's narrative of his expedition of 1673 in such fashion as to convey an impression

that Marquette easily traversed the waters of the Desplaines to Lake Michigan from the lower Mississippi River. A fair reading of the entire excerpts presents no proof whatsoever of his use of the Desplaines River. The account offered by Prof. Alvord (Abst., 23) discloses that "another river" which left the Mississippi at about the 38th degree is the Illinois and not the Desplaines. Marquette says it is "wide, deep and still" for 65 leagues (which description never has applied to the Desplaines), and that they found on it the Indian village of Kaskaskia (which no one has ever placed on the Desplaines River but which was in the neighborhood of Ottawa) from whence he was *escorted* by the young men to Lake of the Illinois (Lake Michigan) (Abst., 23.) Marquette speaks of the ease of a portage of 30 leagues (Abst., 1461), carrying his canoe, and it is a reasonable conclusion, from the fact that his journey was made in September, that when the young men of Kaskaskia village escorted Marquette's party to Lake Michigan they *probably* portaged the whole or most of the length of the Desplaines River. His equipment was of the lightest and easy to transport. (Abst., 1532.)

Alvord, contrary to the plain meaning of the context, insisted that Marquette's statement that "In the spring and during part of the summer there is only one portage of half a league" (Abst., 23) referred to the Desplaines. The Government quotes this in its brief (p. 38). Marquette was referring to the Illinois from about where Ottawa is now situated to the Mississippi. (Abst., 211.)

Counsel say of La Salle's trip of 1681, simply that he "went up the Illinois River to Lake Michigan in search of Tonty."[7] La Salle returning from Canada by the much longer St. Joseph-Kankakee River route, found the Illinois village near Fort Creve Coeur (near the present site

of Peoria) (Abst., 29) sacked; went on down the Illinois River to the Mississippi in search of Tonty, and returning back up the Illinois and to Lake Michigan. On cross-examination Alvord admitted that there was no proof that La Salle went to Chicago, or any particular distance up the Desplaines, his ultimate destination being the fort on the St. Joseph. (Abst., 28.) *It is explicitly stated that suffering great hardship he went on foot,* the river being frozen. This journey, therefore, could have nothing to do with the use of the river in boats. (Abst., 1609, 32, 33.) Alvord says he did not put this instance in as being of much use. (Abst., 214.)

Of the "similar" trip which counsel say Tonty made, the account, ascribed to La Salle (Brf., 7, Abst., 29) simply says that Tonty "ascended this river without leaving any signs of his passage." Tonty himself, writing of the journey, simply says, "We made our portage." (Abst., 30-31.) No other account of this journey is more explicit. We do know, however, from the context of all these accounts, that the journey was made in the late fall or early winter, because Tonty reached the Pottowatomi village, further on, in December. From our knowledge of the usual stage of the river at this season, it is reasonably certain the portage was a large portion, if not all, the way from the mouth of the Desplaines to the Chicago. The accounts of Joutel (Abst., 1922, 1736, 1741, *et seq.*), Charlevoix (Abst., 58, 266, 1405, 1406), Hubbard (Abst., 1509 *et seq.*) Schoolcraft (Abst., 1569 *et seq.*), Graham and Phillips (Abst., 1403), La Salle (Abst., 257, 294), St. Cosme (Abst., 1692), Joutel (Abst., 1742), Tanner (Abst., 3253-3256), and others, elsewhere presented in the briefs, support this concluson. (Abst., 1608.)

Alvord's statement that La Salle and Joliet were not in disagreement as to the use of the Desplaines for commerce

in small boats and canoes, is not correct. La Salle expressly stated that the river *was not even navigable for canoes*, except after some storm. (Abst., 257-258.) He said it would be better to use horses, or go around by the Kankakee.

Alvord's statement that La Salle's rejection of the Desplaines in favor of the Kankakee route was due to prejudice against Joliet as a Jesuit, and La Salle's interest in diverting the fur trade of the Illinois country to the Gulf, is quite beyond reasonable defense. It was of vital importance to La Salle, and to the welfare of his post on the Illinois, that he should avail himself of the most direct route to, and from, Canada. It is inconceivable that he would use as he did use, the St. Joseph-Kankakee route, if the Desplaines River route, more than two hundred miles shorter, were available, and this simply because he was prejudiced against the Jesuits. (Abst., 279-1601-1604.) Each route brought him to Marquette's mission, which was not at Chicago, but at Kaskaskia (not the Kaskaskia of later times) on the Illinois, in the heart of the field of La Salle's operations, and at the very door of his capital, Ft. St. Louis. (Abst., 1604.)

Joliet is known to have passed through the Illinois country but once, whereas La Salle is known to have been intimately familiar with it over a period of many years. As to Joliet we have only Frontenac's understanding of what he is said to have related, while as to La Salle we have his own account, with his reasons in great detail for his disagreement with Joliet.

Counsel (Br., p. 41) refer to *Joutel's Journal* of La Salle's last voyage as one of Alvord's sources showing the use of the Desplaines River. *One of Alvord's grossest inaccuracies was in connection with the account of Joutel's journey.* He used in part a poor, or rather, garbled trans-

lation, which omitted entirely the portion of the narrative which tells how Joutel came from the Illinois to Chicago. He also used in part the French work of Margry which is correct, but he did not refer to that portion of the latter which tells the true story of Joutel. *The "Government brief" refers only to the journey referred to in this garbled version of the journal. Joutel's experience, as it appears in the correct translation, showed that the Desplaines in its natural state was generally incapable even of canoe navigation.*

In the original French in Margry, Vol. 3, page 480, but not in the translation used by Alvord, it appears that Joutel and the remainder of La Salle's party were at Fort St. Louis (Starved Rock) and desired to go to Mackinac. They arranged to have Indians carry their goods to Lake Michigan, 30 or 40 leagues, for the reason that at that season there was *"no water at all in the river, or at least very little, this being a troublesome matter."* (Abst., 1741, 1742.) Just as they were about to depart three men arrived from Mackinac whence they had come by lake to Chicago, *and leaving their canoe there* they traveled on foot to Ft. St. Louis. It was arranged that Joutel's party should trade their canoe for the one left by these men at Lake Michigan. *In the narrative used by Alvord it was stated that these men came in December, and that they failed to carry their goods in a canoe down the Desplaines because the river was frozen. The Margry edition shows that the month was September, and the reason was not that the river was frozen, but that there was no water in it.* Joutel's party traveled on foot to Chicago There they found the canoe which the Frenchmen had left in the lake, embarked in it, undertook their journey, failed, turned back and made their way to the fort on the Illinois, *leaving their canoe at Lake Michigan.*

Here were two trips, therefore, made over land by Joutel and his party for a distance of 30 or 40 leagues, and although, having canoes, they did not use them because there was no water in the river. (Abst., 1739, 1744.)

In the following spring they returned to Chicago with a canoe, but when they came to the Desplaines, which is described as "a rapid stream" they were obliged to go ashore and then again into the water to draw along the canoe, and the narrator says that they were "under a necessity of going often into the water." *This third trip alone is referred to by Alvord on his direct* (Abst. 44-45; and is the only one referred to in the Government's brief. Counsel say (Br., p. 40):

> "Government introduced a map by Father Hennepin published in 1683, which shows the Chicago-Desplaines-Illinois route connecting Lake Michigan with the Mississippi; the Chicago-Desplaines portage is also shown."

They omit any reference to Hennepin's description of the Desplaines, which certainly should be considered in connection with his map. He said:

> "The creek through which we went from the Lake of the Illinois, into the Divine River, is so shallow, and so much exposed to the storms, that no ship can venture to get in, unless it be a great calm. Neither is the country between the said creek and the Divine (Desplaines) River, fit for a canal; for the meadows between them are drowned after any great rain, and so a canal will be immediately filled up with sands; and besides, it is impossible to dig up the ground, because of the water, that country being nothing but a morass; but supposing it were possible to cut the canal, it would be, however, useless; *for the Divine River is not navigable for forty leagues together;* that is, from that place to the village of the Illinois,

except for canows, who have hardly water enough in summer time. Besides this difficulty, there is a fall near the village." (Abst., 38.)

Counsel say (Brf., p. 41) that Champigny wrote Louis XIV stating that Tonty and de la Forest had a warehouse at Chicago and another at Michilimac'.inac. The statement is in a communication dated 1697, and is that "they now have a warehouse at Chicagou, in the country of the Miamis." Counsel ignore the admittedly general application during that period of the term: "Chicagou," and its variations, to the region to the south, southeast and southwest of Lake Michigan (Abst., 227) and the fact that the Miamis were generally located around the St. Joseph and to the southeast of Lake Michigan. (Abst., 206-208, 210, 261, 262, 263, 264.) The fact was that at this time *there was* a post at St. Joseph which had been erected by La Salle (Abst., 228) and in view of all the circumstances, it is but reasonable to suppose that this was the post of Tonty and de la Forest, to which Cadillac referred.

Counsel next take up the narrative of St. Cosme's journey. (Bf., p. 41.) *It is one of the most persuasive source evidences that the Desplaines was not, in its natural condition, capable of even canoe navigation, except during short periods of flood.* We ask the court to compare the statement made concerning it in our opponent's brief with the narrative itself as it appears on pages 48 to 51 of the abstract. It is an excellent illustration of how inadequate and one-sided their statement of the evidence is. They say Shea (an historian)

> "gives an account of St. Cosme's going down the Chicago Des-Plaines route. He left Chicago October 29,

1700, made a portage 'which is three leagues long, when the water is low and only ¼ of a league in the spring.' P. 49."

The portage here referred to was from the Chicago to the Desplaines River. *When the party reached the Desplaines River it was compelled to make a portage all the way to the Illinois.* "They saw well that being obliged to carry their effects and canoe it would take them a great while to reach the Illinois." They dragged their canoe because there was no water. "You always make a portage, there being no water in the river except in the spring." The men "marched on land, each with his pack." From Chicago to the fort they reckon 30 leagues. "Here navigation begins." It took St. Cosme's party fourteen days to go from Chicago to the mouth of the Desplaines. And when St. Cosme returned over this same route in the spring his party did not use the river at all, but walked from approximately the region of Starved Rock. (Abst., 1565.)

It is next stated by counsel (Brf. 42) that Thwaites' Jesuit Relations contains a letter from Father Gravier which the witness says indicated he used the Des Plaines route September 8, 1700. There is in the excerpt no such reference. It is a mere inference of Alvord's from Father Gravier's statement that he had received a letter at "Chikagoua"—"whence I started on the 8th of September to come here," that is, to the Guardian Angel Mission. (Abst., 203.) The location of this mission has never been accurately established. (Abst., 202-208.) There is not the slightest evidence that it was on the Illinois or the Desplaines. Thwaites says that in his opinion it was at Chicago, but in the index to his Jesuit Relations it was referred to as being on the St. Joseph. (Abst., 378.) And in 1 Jesuit Relations, 223, Thwaites fixes it as being in the lower peninsula of Michi-

gan. (Abst., 204-205.) The only value this excerpt has lies in the fact that it illustrates how far afield Alvord went to establish the historical use of the river.

Next counsel referred to a rough draft of a report by James Logan in "Chicago Antiquities." Logan probably never came further west than Philadelphia. He was simply an ill-informed writer of the period. (Abst., 1538.) Dr. Thwaites said he would consider that Logan's report was made by a man not personally familiar with the western country. (Abst., 363.) In this same report, Logan describes "Fort Miami" as on the mouth of the Chicago River (Abst., 57), and thereby discloses his ignorance of the facts, because there was no fort at Chicago at that time. (Abst., 1870; Abst., 52, 198.) Fort Miami was a well known fort at the St. Joseph River on Lake Michigan. (Abst., 198-199, 454, 460.) Logan's description of what counsel interpret as the Chicago-Desplaines portage, accurately described the St. Joseph-Kankakee portage (Abst., 306-307) and it is clear that his information was with reference to the latter (Abst., 454 *et seq.*), and that his application of the term Chicago to the St. Joseph River reflected lack of knowledge, or the intentional use of the word as applied to the St. Joseph, to which it was not infrequently applied during that general period. The Kankakee is really the upper Illinois, and it was often included in the designation of the "river of the Illinois." It is important to note that this report of Logan's which clearly applies to St. Joseph, and not to Chicago, was adopted by other writers whose works have been introduced by the Government and which are referred to in its brief, and by repetition of the same erroneous report in various books and pamphlets, an imposing mass of misstatement has been introduced into this record.

Charlevoix (Brief, p. 143) is next referred to in the

Government's brief, but if the court were left to rely only on that reference, it would have little understanding of the significance of the excerpts from Charlevoix's letters which were read in evidence. The Government's historical excerpts (Abst., 389, 266, 431) *relying on an incorrect translation made of his narrative in 1761* say that Charlevoix was turned aside from his use of the well known Chicago-Desplaines route because of a storm which hindered his going around the southern end of the lake, from the eastern shore.

The translation of 1761 omits Charlevoix's statement that he took the St. Joseph route which was much longer, because the Desplaines was "but a brook." (Abst., 58, 1187.) Prof. Alvord, who introduced the translation of 1761, knew of this omission. He had used the correct translation of 1763 (Abst., 1187-1189) in the State case. Counsel say "The foregoing not in the State case." The erroneous translation was not, but the correct translation was. Charlevoix's account (Abst., 59) of the difficulties of the St. Joseph-Kankakee route, and what we know of its very much greater length, forces the inference that the difficulties of the Desplaines route must have been very great indeed. (Abst., 1406-1408.)

Mitchell (Brf. p. 43), who in 1757 said the French, in their fur trade, had hitherto been obliged to go by the great lakes and "down the river Illinois into the Mississippi," does not thereby shed any light upon the use which was made of the Desplaines River in traversing a route he designates so generally as to include the Kankakee-St. Joseph Rivers. There is no evidence that he ever saw the Illinois country much less than the Desplaines River.

Dupratz (Brf. p. 44; Abst., 66) also makes a general statement in his book published in 1774, that the first

travelers came from Canada, by way of the Illinois into the Mississippi. No mention is made of the Desplaines. Dupratz is not shown to have been north of the Ohio River, and what he says is a mere second-hand statement of a general route. (Abst., 1433-1434.)

Choiseul, who wrote the memorial in which is the reference to the portage aux Chenes into the Illinois, was never in America and had no direct knowledge of its geography.

There is no evidence that *Thos. Hutchins* (Brf. p. 44; Abst., 72), who says the Illinois River affords communication with Lake Michigan, was ever in this portion of Illinois. (Abst., 1170.) All that Hutchins presents in his book by way of detail of the Illinois country, is by reference to an account by one Kennedy who tried to ascend to the headwaters of the Illinois in a boat, in August, 1773, which he was compelled to abandon 15 miles below the mouth of the Desplaines because of shallow water. (Abst., 1525.) Any possible inference to be drawn from Hutchins's statement as to the navigability, of the Desplaines is certainly negatived by Kennedy. (Abst., 1172.)

Jean Baptiste Perrault (Brf. p. 45; Abst., 76-79) came up the Illinois in the springtime flood. He left Cahokia May 4, 1783, had one barge and one canoe, and was directed to *"pass by Chicago"* and rendezvous on Lake Michigan. The Desplaines is not mentioned in his account. (Abst., 217.) It was perfectly possible for him to "pass by Chicago" without coming up the Desplaines. He may have come up the Kankakee, or by the Calumet. Callot went by the Calumet to Chicago (Abst., 218, 1563) and La Salle, Hubbard and others took the St. Joseph route.

Hugh Heward (Brf. p. 46; Abst., 81, 83), who traversed the Desplaines *in a pirogue* in May, 1790, went down in a period of extreme high water, and that the

danger of the trip was great appears from his narrative. He speaks of a portage and long rapids. Some of his men, after passing Joliet, told him that because of the dangers they might not return with him.

Callot (1826), who speaks of boats passing from the lake into the Desplaines (Brf. p. 47; Abst., 88), relates a condition which was limited to a period of extreme high water in the spring. He also points out the possibility of gaining the lake from the Illinois River by the Calumet route, in high waters.

Imlay (Brf., Part II, p. 15; Abst., 89), who said that the Illinois was navigable *for batteau* to its source from whence was a portage only 2 miles to Chicago, was never at Chicago (Abst., 1529, 240); he named Charlevoix, Carver and Hutchins as his authority on the Illinois country, none of whom had ever traversed the Desplaines route. His statement as to the distance from the portage on the Chicago River to the lake, which he says was sixteen miles, shows his information to have been very inaccurate (Abst., 241, 1529.)

Counsel say that *Robert Dickson* (Brf., p. 48; Abst., 91) mentions the route by Chicago as one of two ways of communication between Mackinac and the Mississippi. Dickson said "the communication between Mackinac and the Mississippi is carried on by two routes, the one by Chicago, the other by the Fox and the Wisconsin Rivers, *the latter is preferred on account of the shortness of the carrying place.*" As appears elsewhere, the carrying place between Chicago and the Illinois, was frequently to a point far down that river.

The Treaty of Grenville, 1795 (Abst., 90), makes no reference to the Desplaines, but to the portage between the Chicago River and the Illinois, and down the Illinois to the Mississippi.

Counsel omit any reference to a letter of one Selby introduced by Alvord, although material immediately preceding, and following, it is dwelt upon.

Prideaux Selby, who was Secretary of the Indian Department at Detroit from 1790, for a number of years, points out that the route from Mackinac by the Illinois River, though much nearer, is to be rejected in favor of the long Fox-Wisconsin route, *because the former subsides too rapidly to be available for the carrying of troops or supplies and is, even when high, filled with rapids and shallows.* (Abst., 92.) This is an answer to the claim of counsel that the Desplaines was used for the transportation of troops, in support of which there is no evidence in the record, and throws light on Forsythe's statement next to be referred to.

Thomas Forsythe, 1814 (Brf., p. 48), indicates nothing as to use made of the Desplaines. Forsythe's table is to be interpreted in the light of knowledge from other sources of conditions governing the navigation of the Desplaines. This observation applies with equal force to his mention of the possibility of Indian attacks from above, down the Chicago-Illinois route by canoes (p. 97). He must have known, as did Marquette, St. Cosme, Charlevoix and others before him, that the water was ordinarily very low and unnavigable even for canoes, and that, as Marquette relates, a portage of 30 leagues was a very simple matter to Indians with their light canoes. (Abst., 1435, 1436.)

The letter of *Governor Cass,* in 1815 (Brf., p. 48, Abst., 97), does not mention the Desplaines River, but speaks of the route by way of Chicago and down the Illinois as one of the three great channels of communication from Canada to the Mississippi. The evidence discloses that about this time there was a well-beaten wagon road all the

way from Chicago to the Illinois, over which boats were carried in wagons (pp. 3255).

John Kinzie, who wrote Cass in 1815 (Brf., Pt. II, p. 16; Abst., 100) that at that time boats of several tons burden could pass from Lake Michigan into the Mississippi River, was making a plea for the re-establishment of conditions that would restore his trading business lost to him by the Chicago Massacre. (Abst., 1534.) He understated the difference in elevation between the two waters, and did not limit the period during which the boats might pass. (Abst., 1852.) Kinzie's tendency to overstate is illustrated by his remark that he had lived in Chicago 20 years when he had only lived there eight years. (Abst., 470.)

Wm. Darby (Brf., p. 49; Abst., 105-108), who mentions the Chicago and Illinois Rivers as affording the most eligible natural connection between the north and south waters of the United States, and prints an editorial from the St. Louis *Inquirer,* as "deciding the long-contested problem of a natural water communication between the waters of the St. Lawrence and Mississippi Rivers," was never any nearer the Desplaines than Detroit and southern Illinois. (Abst., 279.) The editorial, as we shall point out, is extremely inaccurate in its description of the rivers and is recognized by Thwaites (Abst., 395) and McLaughlin (Abst., 352) as being "somewhat exaggerated." Darby's statements are obviously founded upon it, and are equally inaccurate. The editorial was written by Thomas H. Benton, Senator from Missouri, as part of his propaganda for the building of canals by the Federal Government. (Abst., 1175-1177.) The statement in the editorial to which counsel refer to the effect that "in high water boats of 10 or a dozen tons pass without obstruction," and that "Hundreds, nay thousands, of boats have been seen at St. Louis had made a similar passage," cannot have been true. There was no

population, or trade, in Illinois, or Chicago, to demand a commerce such as that which the alleged "hundreds, nay thousands of boats" carried. (Abst., 1178-1183.) Two years after the date of this editorial there were but five houses in Chicago (Abst., 1108-1109), and there was but one house on the Illinois and Desplaines between the Mississippi and Chicago. (Abst., 1111-1112.) The nature and amount of commerce on the Lakes up to 1840 was not such as to make possible such a commerce between St. Louis and Chicago. (Abst., 1183-1186.) A portion of Hubbard's furs were shipped from Chicago for the first time in a small schooner in 1823, which had brought supplies for the garrison. The course of trade of the French of Cahokia and vicinity was not by way of the lakes and the Illinois (Abst., 1341-1343), but by New Orleans. (Abst., 1419.) From 1763 to 1790 trade between Canada and Illinois country and St. Louis was by the Wabash route. Kinzie used bases from 1804 to 1812, and from 1812 to the time of the editorial there was little trade, and few traders, because of the war of 1812. In the latter year the garrison at Chicago was massacred and the settlement destroyed.

Darby concludes a very inaccurate description of the headwaters of the Chicago and the Desplaines (Abst., 106) with the remark that *"the Plein* (Desplaines) *also flows with a very slight current* and the two streams *present almost a strait* between the Mississippi River and Lake Michigan. (Abst., 106.)

The editorial includes this:

> *"They* (the Chicago and Desplaines) *have neither falls nor shoals; they have not the character of streams but of canals; the water hardly moves in their deep and narrow channels."*

On the contrary, the Desplaines has a fall greater than the Sault Ste. Marie Rapids (p. 2216).

La Salle described the river as having a greater current than the Rhone. The Government's chief engineering expert, Mr. Cooley, in an official report to the Governor of the State, said:

> "From the end of the 12-mile level to Lake Joliet was seventeen miles—a mere surface stream over bedrock—with a steep declivity over the lower half of the distance descending to a level of 76.5 feet below Lake Michigan. * * * The Desplaines River practically goes dry above Joliet."

Government's counsel refers to the report of Graham & Phillips and to the fact that Phillips was Judge of the Supreme Court of Illinois. That report discusses the feasibility of opening communication between the Chicago and the Desplaines by means of a canal. It contains this language: "The Plein, during half the year, does not contain water enough to float a boat and so could not become useful as a national highway" (Abst., 115); and further that at one season of the year there is "a portage of fifty miles, from the mouth of the Plein to the lake over which there is a well-beaten wagon road and boats and their loads are by oxen and vehicles kept for that purpose by the French settlers at Chicago." (Abst., 116.)

The Government relies largely on Gurdon S. Hubbard's "Sketch of Life," referred to in our original brief (pp. 114-117). The use made of it in the Government's brief makes some further comment necessary. This work was introduced by Alvord. Until cross-examination he made no reference to the portion in which Hubbard gave his reasons for abandoning the attempt to use the Desplaines when he became Superintendent of the Fur Company, and none to his use of the very much longer

route by the St. Joseph and the Kankakee to the Illinois, to avoid "the delay and hardships of the old route through Mud Lake and the Desplaines." (223.)

In the Government's brief it is said "Hubbard's account shows that in the fall in the dry weather the boats were unloaded and pushed *through the ditch on short rollers.*" (Br., p. 54.) The ditch here referred to is between the Chicago River and the Desplaines. The narrative immediately following discloses that Hubbard and his party had the same difficulties to contend with all the way down the Desplaines to the Illinois.

Hubbard said (Abstract 120):

> "It took us three consecutive days of such toil to pass all our boats through this miserable lake; when we finally camped on the banks of the river (the Desplaines) our goods had all crossed the portage and we were once more ready to proceed. Our boats being again loaded, we resumed our voyage down the Desplaines until we reached Isle La Cache, where low water compelled us to again unload our goods in order to pass our boats over the shoal that here presented itself; and again we encamped after a hard day's labor."

Isle La Cache is but a few miles down the river, and is above Lockport. From that point Hubbard's party were compelled to carry their goods on their backs nearly all the way to the Illinois River. He says, page 121:

> "Our progress from this point was very slow indeed, and most of the distance to the Illinois River our goods were carried on our backs, while our lightened boats were pulled over the shallow places, often being compelled to place poles under them, and on these drag them over the rocks and shoals. In this manner almost three weeks were occupied in reaching the mouth of the Fox River and two days more brought us to the foot of Starved Rock."

Fox River is far down the Illinois, and the passage therefore shows that the upper Illinois and the Desplaines would not accommodate the passage of boats.

Hubbard's narrative all through throws light upon the conclusion of the Government experts "that traders found a very easy passageway by means of these rivers in the early spring." There is no record of any trader passing up this river in a boat carrying furs or other produce, except in Hubbard's narrative. He says, concerning his return trip, page 122:

> "The first night we halted at our old camp ground at the foot of Starved Rock. From this point, until we reached Cache Island, our progress was very slow, averaging but from six to ten miles per day. The river was high, the current swift, and the rapids strong, and as the boats were heavily laden and a cold storm prevailed, we were glad to camp early and afford the men a much needed rest. Early in the morning we left Cache Island, and as the wind was strong from the southwest, we hoisted our square sails for the first time, and rapidly passed up the Des Plaines River, through Mud Lake, to South Branch, *regardless of the course of the channel,* and soon reached Chicago."

It is to be remembered that Cache Island is above Lockport, that the rapids are below that point and continue at intervals all the way to the Illinois River. The easy passage was only from Cache Island to Chicago, which was nearby, and was over prairies flooded with water; a condition which existed for very short periods in the spring. The channel of the river was disregarded.

That the passage was not easy in the spring is shown by the accounts of La Source and Montigny, who having traveled up the Illinois by water as far as possible, went by land 90 miles to Chicago. (Abstract 1565.)

In 1675 a surgeon attempted to pull his boat up river in the spring, but he gave up the attempt. We have referred to the unsuccessful attempt of Joutel's party to do the same thing.

The next work referred to by counsel in connection with Alvord's testimony is the narrative of *Schoolcraft*. Alvord omitted a portion of that narrative in which Schoolcraft not only showed the Desplaines to be unnavigable, but also committed himself to the opinion that no short canal would effect communication between the Chicago River and the Illinois.

Schoolcraft came up the Illinois in a canoe in August, 1821, for the purpose, among other things, of examining the situation with reference to the proposed canal. He was forced to abandon the canoe at about Starved Rock. There was often less than four inches of water. Therefore, he and his party came by horses from the Illinois to Chicago. He referred to the error of those who supposed a canal of only eight or ten miles would be necessary to perfect navigation between Lake Michigan and the Illinois. (Abst., 1192-1193.)

Upon cross-examination, Alvord testified that when he prepared his evidence on the direct, he knew of this portion of the narrative, but did not use it. Likewise, Alvord did not refer to a footnote in Schoolcraft's Travels, being an extract from an account by *Thomas Tousey* of his visit to the Desplaines in 1822, which appears at page 113 of our original brief. Tousey said that he came imbued with impressions favorable to the canal, but concluded that the project of the canal would be of greater difficulty than he, or the public, generally had supposed, *the ignorant supposition arising from the study of books and maps instead of viewing the country as he did.* (Abst., 1189-

1190.) It is a fair presumption that Tousey's erroneous impressions must have been gained from some of the misleading compilations on which the Government and its experts rely, most of whose authors never saw the Desplaines. These erroneous statements can nearly all be traced back to Logan's report, and to the work of Hutchins, to whose errors we have referred.

Counsel next refer to the journey of *Ebenezer Childs* in 1821, from St. Louis to Chicago. He came in a light canoe with two men and no cargo. It was in the time of the spring floods, the whole country was inundated, and he traversed the prairie in his canoe from the Desplaines to Chicago. In discussing this narrative Prof. Thwaites expressed the opinion that if, for a couple of weeks in the spring, the country was inundated between the Desplaines and Chicago Rivers, so that boats passed over it, that would establish it as a navigable route for travel. (Abst., 884-885.) This is a side light on the conception which the Government's historical experts had of the meaning of the term "navigable stream," and upon the value of the conclusions they have drawn from the narratives upon which those conclusions were founded.

In the Government's brief (p. 56) appears the following:

> "Ordinance of 1878 fixed the northern boundary of the Illinois at the line west from the Southern boundary of Lake Michigan. Pope, the Illinois delegate, got this changed so as to have a port on the Lake which would tend to bring in the northern settlers by the northern waterway. This obviously refers to the Chicago Desplaines."

This is an excellent illustration of the tenuous inferences which the Government is compelled to draw to build

up its case. Obviously the language means, and the context shows, that the purpose was that northern settlers should come in by the Lakes, rather than to have the current of immigration from the South by the Ohio. (Abst., 129.)

The next work referred to by counsel is *Ogden's Letters.* (Brief p. 56. Abst., 128.) Contrary to the statement of Alvord and of the Government's brief, Ogden was probably never in Illinois. Thwaites had edited these letters with a preface giving authority to them. It was shown by Prof. Quaife that they were plagiarisms. The fact that Ogden plagiarized is proved, and the sources from which he took his material, are placed in parallel columns, on pages 1547 to 1562 of the abstract.

Beck's Gazetteer (Brf. 56, Abst., 131-133) is based principally upon Graham & Phillips' report (Abst., 132) which, as appears above, stated that the Desplaines could never become a national highway. The Gazetteer also shows, in a passage which counsel does not refer to, that in the writer's opinion a canal would be necessary, and that the Desplaines could not be looked to to supply the water for it, because of the great floods in the spring, and its dry condition at other seasons. (Abst., 133.)

Keating's "Narrative," etc. (Brf. p. 57, Abst., 135, 136), relating that he was informed that "this route was frequently traveled," and that Hopson told him that he had traveled it with ease in a boat loaded with lead and flour, proves nothing as to the use of the Desplaines River. It does not reflect personal experience, or his observation, of the Desplaines because he never passed beyond the Mud Lake region. It is to be observed that Keating exchanged his boat for a pirogue (a hollowed out tree trunk) which drew less water, and that he says

"there was scarcely water enough to permit our pirogue to pass." (Abst., 135-136.)

Fonda's Reminiscences (Brf. p. 58, Abst., 137, 138) merely shows that he passed up the Desplaines in a canoe. If so, we must fairly infer from other sources, either that it was in springtime or that rains had raised the water higher than usual; or else that they had to portage much of the Desplaines. There being no statement as to the latter, one of the two former alternatives is probably the true one. (Abst., 1701.)

"Drown's Peoria" (Brf. p. 57, Abst., 139) which contains the statement that John Hamlin exported produce from Peoria to Chicago in 1825, is an almanac, and directory, and advertising medium, of a flimsy character. It was written a quarter of a century after the alleged fact. Its statement that John Hamlin carried produce from Peoria up the Desplaines to Chicago part way in keel boats and part in Durham boats, building a storehouse at the mouth of the Kankakee, is highly improbable, because there is no other instance in the whole record, of the produce of the country being carried up the upper Illinois or Desplaines by boats, also because the physical conditions made it impossible for boats of that character to pass up or down the river, also because persons who settled in the neighborhood within a few years thereafter never heard of such an event or of any storehouse, said to have been built at the mouth of the Kankakee, and lastly because there was no settlement at Chicago at that time which could have justified such an undertaking. There were but nine people in Peoria in 1825, and but three or four families in Chicago. (Abst., 1820-1823, 1930-1932.) The garrison was removed in 1823. (Abst., 1471.) At the period in question there was produced at Chicago "a superabundance of all the luxuries of farm, cornfield and

dairy." The difficulty was how to dispose of the amount produced. (Abst., 1472.) Commerce on the lake and through this Illinois country was about as disclosed in the authorities referred to elsewhere herein, which have been cited to refute the editorial about "hundreds, nay thousands," of boats at St. Louis which had come there *via* the Desplaines.

The *Report of the Select Committee,* in 1825 (Brf. p. 58, Abst., 140) expressed the opinion that it is feasible to connect the Illinois and Lake Michigan by canal, basing that opinion upon Lond and Graham & Phillips. It was the product of no independent investigation, and has no added weight.

Morse's "American Gazetteer" (Brf. p. 58, Abst., 142) is a mere compilation treating of the geography of the entire world. It was prepared by the editor's assistant, and the pertinent portion is based on Hutchins (Abst., 1169, 1632-33), and it is therefore subject to the same criticisms, as far as it relates to the Desplaines, as are shown with respect to Hutchins.

The Navigator, 1824 (Brf. p. 58, Abst., 147) is also a mere compilation. It presents secondhand information of the region in question. The compiler apparently followed Imlay, for the same error which appears in the latter, and which is above pointed out, is in The Navigator in substantially the same language.

Timothy Flint, 1832 (Brf. p. 58, Abst., 150) claimed no other merit than being "a laborious and faithful compiler." There is no proof that he was ever on the Illinois, or nearer Chicago than Jeffersonville, Ind. He simply repeats the common misapprehension about the ease of communication between the lake and the Illinois. Tousey, as we have shown, points out the unreliability of such publications, and of the erroneous impression which they

had given him as to the ease of communication between Lake Michigan and the Illinois. (Abst., 1835-1836, 1458-1459, 1832-33.)

Hoffman (Brf. p. 60, Abst., 158), who makes the error of stating that the Desplaines rises 11 miles west of Chicago, bases his detailed account of the portage and the passage thereof, upon Keating's account, and is entitled to no more weight than Keating, because though Hoffman visited Chicago it was in extremely cold winter, and he could not have seen the thing of which he writes. (Abst., 1462-1465, 1933.)

Woodruff's History of Will County, 1878 (Brf. p. 60, Abst., 159), wherein it speaks of small steamers plying regularly in 1878 between points on the Kankakee and Chicago, carrying to that city grain and bringing back lumber, salt, etc., makes a statement which is wholly untrue. (Abst., 1578-1579.) During the taking of the testimony, counsel for the Government admitted that these steamers made use of the aqueduct and the Illinois and Michigan Canal, and did not enter the Desplaines at all except where the canal and the river were coincident, constituting the upper and lower canal basins at Joliet. (Abst., 1579.)

Woodruff himself, in his pamphlet containing a series of lectures delivered in 1874, on the history of Joliet and Will County pointed out that the opening of the Illinois and Michigan Canal meant a new era in the history of Joliet and vicinity; that theretofore goods had been transported from Chicago chiefly by ox teams, drawing wagons; that a stage route between Chicago and Ottawa by way of Plainfield was established in 1834; that in 1838 or '39 the route was changed so as to go from Ottawa to Chicago directly up the west side of the river.

Alvord, by whom Woodruff's history was introduced, on cross-examination admitted that "from the evidence that has been introduced I should say that it was not proved historically that it was the usual custom for the farmers living along the Desplaines River to send their products to Chicago by boats." He ventured the thought that there "seemed to be some indication" that such use of the river was occasionally made in the spring or early summer, but being pressed for any such "indication" finally admitted that, except the excerpt from Woodruff's History, he knew of no statement showing such use. He also admitted that there was no instance of any of the farmers who came into this country, getting in by way of the Desplaines River. (Abst., 255, 256.)

Winsor's Narrative and Critical History (Brf. p. 61, Abst., 165) does not "refer to the Chicago-Desplaines route" but to the route "by the Chicago River at the southwest of Lake Michigan to the Illinois, thence to the Mississippi." The Desplaines is not mentioned, and as has been abundantly shown, the portage from the Chicago River frequently extended the whole distance to the Illinois. The context shows also that Winsor was referring to canoe navigation.

Lieut. Col. James H. Wilson's report of 1867 to which counsel refer (Brf. Pt. II, p. 25, Abst., 160), shows the non-navigable character of the stream as follows:

> "The river itself, except in floods, is very shallow, being often reduced in dry seasons to a mere brook, discharging less than 1,000 cubic feet of water per minute. (Abst., 2844.)
>
> This canal, from a point 8 miles southwest of Chicago, follows the valley of the Desplaines, a tributary of the Illinois, until it forms a junction with the Kankakee River, some 50 miles southwest of Chi-

cago, below which the river is known on the map as the Illinois. The latter name would have been more appropriate for the Kankakee above that point, as it is the main river and the Desplaines, in low water, contributes a comparatively insignificant quantity to its volume.

The Kankakee supplies water sufficient to make a good slack water navigation; the Desplaines of itself does not, and although the direction of the former was such that it was not probable that a favorable connection with Lake Michigan could be made through its channel, yet it was deemed advisable to determine that fact beyond cavil." (Abst., 2843, 2844.)

"*Illinois in 1837,*" referred to by counsel (Brf. p. 61, Abst., 162), is a compilation by an unknown author. Alvord did not allude to the following statement in it, "Peru is situated on the Illinois River *at the head of river navigation.*" (Abst., 1527.)

Hinsdale's "Old Northwest" (Brf. Pt. II, p. 27, Abst., 167, 168) merely speaks of carrying place between the Chicago River and the Illinois.

We ask the court's attention to the analysis by Professor Quaife of the conclusions of the experts for the Government, beginning at page 641 of the record. The brief for the United States does not do justice, either to the testimony of Quaife or Lee, but it is manifestly impossible to follow out in detail all the points in which this injustice appears. The brief represents Quaife as refusing to answer "yes" or "no," as to whether the Desplaines was used by fur traders in the 17th Century, and as refusing to draw any conclusions as to whether or not the Desplaines was ever used, except in the fifteen instances pointed out in the record. (Brf. 115.) A reading of Quaife's testimony will show that this is not a fair state-

ment. He did refuse to answer "yes" or "no," because he said such an answer would be misleading. And, he went on to point out what he meant by that. But he stated "that it was so used was a warrantable, a possible, and a probable deduction." (p. 1656.)

II

THE ACT OF THE ILLINOIS LEGISLATURE UNDER WHICH THE SANITARY DISTRICT CANAL WAS BUILT, WAS FRAMED EXPRESSLY TO PROTECT PRIVATE WATER POWER RIGHTS IN THE DESPLAINES RIVER. THE CHARGE THAT MUNROE AND HIS ASSOCIATES SOUGHT TO FORESTALL THE SANITARY DISTRICT IN DEVELOPING WATER POWER IS WITHOUT JUSTIFICATION.

In the Government's brief an attempt is made to create the impression that Munroe and his associates acquired the land for the building of the dam with a view to forestalling the development of water power by the Sanitary District, and to take an undue and unwarranted advantage of the expenditure of some $63,000,000 by the public in constructing the Sanitary District Canal. They refer to the fact that Sections 5 and 6 of the Act of the Illinois Assembly, May 14, 1903, empowered the Sanitary District to develop, use and sell the water power created above the upper basin of the Illinois Michigan Canal, as showing that this was the policy of the State; but the Government does not tell this Court that the Act in question was so drawn as to expressly protect the private water power rights below the mouth of the Sanitary District Canal, and that it expressly prohibited the trustees from exercising any power over the waters drawn from Lake Michigan through the Canal after those waters left its southern terminus. The upper basin of the Illinois and Michigan Canal where the Act empowered the trustees to develop water

power was at and above Joliet. The power there belonged to the Sanitary District. The dam which appellants propose to construct and was constructing was some 14 miles below that point. Section 7 of the Act referred to provided:

> "In no case shall said Board (Board of Trustees of the Sanitary District) have any power to control water after it passes beyond its own channel, water ways, races or structures into a river or natural water way or channel, or water power or dock situated on such river or natural water way or channel."

The water power in question here being far below the point where the water passed from the channel of the Sanitary District, clearly it was not only not contemplated that the Sanitary District should have any power of control over it, but such power was expressly denied. The 23d Section of the Act provided:

> "This Act shall not be construed to authorize the injury or destruction of water power rights."

One of the water power rights thus protected was that which appellant purchased. At the very point where appellant sought to erect its dam a water power existed and a dam was erected in 1833. Counsel say in substance that there was no water power along the Desplaines, except at dam No. 1 at Joliet, which had any value in a modern sense until the addition of the waters of Lake Michigan. Several water power dams at points below the junction of the Sanitary District with the Desplaines existed from the earliest days of settlement. A summary of them is given at page 2084 of the Abstract. It was, of course, known to the Legislature when it passed the Act creating the Sanitary District, that those powers would be greatly increased and rendered more valuable by the addition of the waters

of Lake Michigan. It is a well-known fact and appears from the Record that the preservations of these very water powers was debated and thoroughly considered by the Legislature, and that sections 7 and 23 of the Act were incorporated for the express purpose of protecting them (Abstract, pp. 2020-2023). If, as counsel claim, there was no natural water power of any value in the modern sense along the Desplaines, except at Dam No. 1, the Legislature must have intended that the existing water power which would become valuable in the modern sense should be preserved and protected.

Counsel say that Munroe obtained from the State whatever rights it might have had in connection with the water power at Dresden Heights through what they characterize "frugal arrangements" with the Trustees of the Illinois and Michigan Canal. To meet what is insinuated by this statement it is only necessary to refer to the decision of the Supreme Court of Illinois in *State vs. Economy Light & Power Company,* 241 Illinois 20. It is there made clear that the State had no rights in that connection, and its ownership was only of the canal and its tow banks and of a very few acres of worthless land it had never been able to sell, and which Mr. Munroe bought at the price at which it had been carried for years on the books of the Trustees. The contracts with the Trustees of the Illinois and Michigan Canal were declared valid by that opinion of the Supreme Court of Illinois.

III

THE STATEMENTS IN THE GOVERNMENT'S BRIEF AS TO THE CIRCUMSTANCES CONNECTED WITH THE SUBMITTING OF PLANS TO THE SECRETARY OF WAR ARE IN DIRECT CONFLICT WITH THE RECORD

Counsel for the Government referring to that subject

say they feel constrained to "lay the whole matter before the Court" (Brief, 24). That which they have laid before the Court bears no resemblance to the facts. They say, and reiterate, that the officials of the United States expressed no opinion as to the navigability of the Desplaines, but that Mr. Munroe insisted at every step that it was not a navigable river (Brief, 168). The fact is that Colonel Bixby, the local engineer in Chicago, and General Mackenzie, the Chief Engineer, assured the Assistant Secretary and the Secretary of War that the stream was not navigable, and it was because of the statements so made by General Mackenzie to Secretary Taft that the latter gave his opinion that the Government had no power to interfere with the construction of the dam in the river. Counsel say (p. 19):

> "Colonel Bixby, the local engineer, in his letter dated March 27, 1906, does not attempt to pass upon the question of navigability and deals with the question upon the representation of the water power company that it is not navigable."

Both statements are contrary to the fact. No representation of the Water Power Company, or of any predecessor in title, that the stream was not navigable appears in the Record. But Colonel Bixby's letter expressly says:

> "The Desplaines River, so far as now known to this office, has never been considered a navigable stream of the United States. It is therefore apparently as yet subject to such jurisdiction as applies to all other unnavigable streams and not subject to the provisions of Sections 9-13 of the Act of March 3, 1899, or to other similar U. S. legislation." (Abstract, 2872.)

It is hardly necessary to comment upon the claim gravely made in the Government's brief (p. 168) that

Colonel Bixby acted upon the statement of Munroe that the Desplaines was not navigable, when it is remembered that Bixby was the Government engineer in charge of the District, and that his office was at Chicago within a few miles of the Desplaines River.

Counsel referring to the hearing before Secretary of War Taft, when the Trustees of the Sanitary District sought to persuade him to prevent the further construction of the dam, say:

> "After reading the record on this subject counsel's contention that the War Department assured appellant's predecessors that the stream was non-navigable, has some elements of humor." (P. 170.)

It is apparent that counsel themselves have not "read the record on this subject." They say the account of this proceeding is very meager and begins on page 1935 of the Abstract. There is a meager reference to it at the place mentioned, but counsel have overlooked the full report at page 3219 to 3228, and this although we called attention to it in our brief. The record as there presented shows that it was General Mackenzie, Chief of Engineers, who advised the Secretary of War that the stream was not navigable. Counsel state in their brief, page 22, that:

> "The Secretary and the Engineer did not inform appellant that the stream was not navigable but appellant informed them in regard to the matter."

Counsel would have this Court believe that the Chief Engineer of the Army, within whose jurisdiction came the subject of the navigability of rivers, sat back and permitted Mr. Snapp to deceive the Secretary of War, and that thereby the Secretary was led to say that the stream was not navigable. They would have it believe that when

the Secretary asked the engineer as to the fact Mr. Snapp took the answer out of his mouth. At page 3223 of the Abstract it appears that Secretary Taft asked this question: "As a matter of fact, it is not now navigable?" And General Mackenzie answered: "It is not now navigable." General Mackenzie further said in reply to the Secretary that the Department was not seeking to exercise any authority over an existing navigable stream, and that if Munroe's associates went ahead the Government could not go into court and could not by an order of the Department prevent them from doing anything. General Mackenzie added that "possibly we would call the attention of the Department of Justice to the matter simply to have them consider it as a legal proposition." Again, Secretary Taft asked General Mackenzie: "Yes, but the Desplaines is not a navigable stream, is it?" And the General replied: "It is not today, sir." We are unable to understand how counsel in insisting that it was Snapp and Munroe and not the engineers who asserted non-navigability of the stream, could have overlooked this part of the record and our references to it at pages 88 to 89 in our original brief.

In the Government's brief in quoting excerpts from Mr. Taft's opinion asterisks are used representing certain omissions from the text. Those omissions are statements by the Secretary which show that the stream was held by the Department not to be navigable. Thus, on page 21 of the brief, appears the following:

> "Mr. Taft then says the application (of the Sanitary District Trustees in opposition to the building of the dam)—'and it is rather informal than otherwise,—is for this Department to take no official action which may interfere with the State control of water power which may be developed in the Desplaines River,'" etc.

Then follow asterisks in the brief. In the record the following language follows:

> "The truth is that the Desplaines River, ***not being a navigable stream, no permit was necessary to put any obstruction in it which the War Department could prevent.*** But even if it had been a navigable stream, and even if the application had been made, and properly made to this department to say whether this would interfere with navigation, if the department concluded that it would not interfere with navigation, it is not within the power of the department to withhold its expressing such an opinion and granting such a permit so far as the United States is concerned, for the purpose of aiding the State in controlling its water power."

And again on page 22 of the Government's brief where asterisks are used, Secretary Taft asserted:

"That the Government had no power to interfere at all" and that statement was based upon the fact that the stream was not navigable.

Government's counsel tell the Court that having obtained title to the property Munroe knew that "only one obstacle stood in the way of his success; that was the navigability of the Desplaines River;" and further that he, Mr. Munroe, being a lawyer, knew that no investigation of the legal status of the matter could be entered upon without having it instantly apparent that the Desplaines was in law a navigable stream, subject to the jurisdiction of Congress, and that under such circumstances he approached the local Government engineer, and through him the Secretary of War practically for the purpose of trapping the Government. They say that at the very "threshold of this investigation lay the *Montel'o* case, 20 Wallace 430," in which the control of Congress over public waters was discussed, navigability defined, and the Chicago-Desplaines-

Illinois route was stated to be one of the three great avenues from the St. Lawrence to the Mississippi which were declared to be within the protective terms of the Ordinance of 1787." In passing it may be observed that the Chicago-Desplaines-Illinois route is not mentioned in the Montello case. The court in referring to Smith's History of Wisconsin states that he says:

> "At this time (1718) the three great avenues from St. Lawrence to the Mississippi were one by way of the Fox and Wisconsin Rivers, one by way of Chicago, and one by way of the Miami of the lake."

We have shown that the Government reports from the earliest down to the latest have stated in substance that the Desplaines was not navigable and could not become the part of a great national highway. But if it were true, as counsel say, that investigation of the legal status of the matter would have made it instantly apparent that the Desplaines was in law a navigable stream, it is unthinkable that Munroe and his associates, so believing, would have invested a huge sum of money in their enterprise without having asked a permit from the Secretary of War. They could have asked it with almost absolute assurance that it would have been granted, and they would then have had clear legal title to maintain their dam, and a solid basis for the $2,000,000 of bonds which they floated, and for their further investment. We say it was practically certain that such permission would have been granted, because there was no reason within the meaning and spirit of law why it should not have been granted. As we have seen, the Secretary of War, in his opinion, definitely stated that if it had been a navigable stream and the application had been made to the Department and the Department had concluded it would not interfere with navigation,

it was not within the power of the Department to withhold its expressing such an opinion and granting such a permit. This language leaves no doubt that the final authority on the matter of granting a permit was of the opinion that he could not lawfully have denied it.

IV

It is not the fact as stated in the Government's brief (page 20) that Assistant Secretary Oliver declined any request of Mr. Munroe's.

Assistant Secretary Oliver refused nothing but took precisely the action which Mr. Munroe asked for and which Colonel Bixby recommended. Mr. Munroe did not ask for a permit for the very obvious reason that the Desplaines was not navigable. What he desired in the submission of the plans was clearly stated in the letter dated March 27, 1906, from Colonel Bixby to General Mackenzie, in which Bixby said:

> "that Munroe and his associates desired to secure from the War Department some opinion informal or otherwise, so far as it can properly be given, that will allow them to assure all inquirers that the War Department so understands the situation and is making no objection to the prompt prosecution of such work as is necessary to a business enterprise of its magnitude and importance."

That opinion the War Department gave (Abst., 2875-2877, original brief pages 87 and 88). In the Government's brief it is said that Assistant Secretary Oliver referred to the conditions which Mr. Munroe and his associates were willing to comply with. He referred to conditions not emanating from Mr. Munroe and his associates, but recommended by Colonel Bixby, and adopted by Assis-

tant Secretary Oliver, and restated in his letter of June 7, 1906, to Mr. Munroe (p. 2877).

Both from this correspondence and the statements of Gen. Mackenzie to Secretary Taft (Abst., 3223), it is clear that Mr. Munroe obtained from the Department exactly what he asked for.

V

The opinion as to the navigability of the Desplaines expressed in the letter of the Assistant Secretary of War to Attorney General Stead, is without weight because it has no reference to navigability as contemplated by the act of March 3, 1899.

Counsel for the Government refer to the letter of Assistant Secretary of War Oliver to Attorney General Stead dated October 28, 1907, in which the Assistant Secretary stated that the Desplaines and Illinois Rivers were considered by the War Department to be navigable streams. This letter was written a few days before the State of Illinois brought its suit to enjoin the present appellant, and nineteen months after the correspondence between Colonel Bixby, General McKenzie and Assistant Secretary Oliver, in which the river was stated to be unnavigable, and in which it was expressly declared that the work proposed to be done by Mr. Munroe would be in general harmony with the improvement recommended by the Board of Engineers under the Act of 1902. If Secretary Oliver meant by his letter to the Attorney General that the Desplaines was navigable for commerce, his statement was directly in conflict with the reports of the engineers of his own department.

The report of the Barlow board had stated that "the upper Illinois and Desplaines Rivers are at present non-

navigable." (Abst., 2855.) The Benyaurd report of 1883 and 1884, had said that the only feasible plan to render the Illinois and Desplaines Rivers navigable between Joliet and La Salle was to slack water the entire distance. (Abst., 655.) The report of General Wilson in 1867 had said that "the river itself, except in floods, is very shallow, being reduced in dry seasons to a mere brook, discharging less than 1,000 cubic feet of water per minute." (Abst., 161.) Further, if Assistant Secretary Oliver meant by the letter in question that the Desplaines was navigable for commerce, his statement was in direct conflict with the testimony of the chief of engineers, General McKenzie, in this case, who said: "From the reports which we have I should judge that the river (Desplaines) is not capable today of conducting a profitable commerce in the way that commerce is usually conducted now." (Abst., 2115.) And further he said: "We consider it navigable in law, we do not consider it navigable in fact." (Abst., 2122.)

The explanation of the difference between the statements contained in the letters of 1906, and in that to Attorney General Stead, may be found in the testimony of General McKenzie. It was his office that advised Assistant Secretary Oliver what answer to make, and he gave his interpretation of navigability in these words: "When we speak of navigability I can only say that a river which will float a log is to us a navigable river, and, undoubtedly, the Desplaines River is capable of such navigation." (Abst., 2115.)

The Act of March 3, 1899, was certainly not intended to apply to "such navigation" and the Bixby-Oliver-Munroe correspondence was dealing with navigation of the kind contemplated by that Act. General McKenzie's recommendation to the Secretary of War as to the proper answer to make to the question of Attorney General Stead, and the weight to be given to the opinion expressed

therein, receives further illumination from the following excerpts from General McKenzie's testimony (Abst., 2121):

> "Q. I would like to get this thing clear, General, so that I can understand it thoroughly. I gather that your opinion and position in the matter is this; that as a legal question, whether the river is navigable in law, or whether the United States has any right to regulate it, is a question that you cannot pass upon, and not intending to express any opinion except that the United States and your department consider all rivers navigable until somebody proves them otherwise?"

This question was objected to, and counsel then asked:

> "Do I state your position fairly, General?
> A. Essentially, yes. We do take that view on the ground that there is no authority outside of Congress and the court that can declare a river navigable."

This further question was then asked:

> "So, on the other hand, you do not mean to say that when your department states this is a navigable river, it does not say that useful commerce can be carried on that river without improvement?
> A. We do not pretend to answer that question."

VI

As to the claim of the Government that the Illinois Legislature has not given consent to the building of the dam.

It is claimed that the record in this case shows, not only absence of authority on the part of the Legislature, but an act approved December 6, 1907, specifically declaring the Desplaines and Illinois Rivers to be navigable streams,

and making it unlawful to construct any obstruction to their navigability and providing for the removal of obstructions then existing. The Act of Congress in question applies only to navigable rivers. The Supreme Court of Illinois in the *State vs. Economy Light & Power Company, supra,* expressly finds that the Desplaines is not a navigable river. It was so found in *Druley vs. Adams,* 102 Ill. 177. Therefore, it follows that no authority was necessary from the Legislature of that State for the construction of this dam. The Act of the Illinois Legislature of 1907 was expressly aimed at appellant in this case. The Supreme Court of Illinois has held that that act was of no validity as against appellant, because the Legislature cannot by its *fiat* make a stream navigable which was not in fact so. The cases which hold that such statutes are ineffectual are numerous.

VII

AS TO THE GOVERNMENT'S CLAIM THAT EVEN IF THE DESPLAINES HAD NOT BEEN NAVIGABLE IN A STATE OF NATURE, THE NAVIGABILITY RESULTING FROM THE ADDITION OF THE WATERS OF LAKE MICHIGAN WOULD HAVE BROUGHT IT DIRECTLY WITHIN THE CONTROL OF CONGRESS AND THE TERMS OF THE ACT OF MARCH 3, 1899, WITHOUT REFERENCE TO THE EARLY ACTS.

This contention appears on page 164 of the Government's brief. It is directly contrary to numerous authorities cited by us in our original brief at page 102, *et seq.* Counsel rely upon cases having to do with the admiralty jurisdiction of the United States over canals opened by States to public use for purposes of commerce, and while in fact used as highways of commerce. We have distinguished these cases at pages 78 to 80 of our

original brief. Counsel for the Government say that *U. S. vs. Cress*, 243 U. S. 316, supports rather than denies their contention. In that case appears the following language, page 325:

> "It follows from what we have said that the servitude of privately owned lands forming the banks and bed of a stream to interests of navigation is a natural servitude, confined to such streams as in their ordinary and natural condition are navigable in fact and confined to the natural condition of the stream. And, assuming that riparian owners upon non-navigable river tributaries of navigable streams are subject to such inconveniences as may arise from the exercise of the common right of navigation, this in like manner must be limited to the natural right."

But counsel contend that where the courts have used the words "in its natural condition" or "ordinary condition," it has used the words "natural" and "ordinary" to indicate the usual or periodic state of the water as distinguished from unusual floods, and not as distinguished from a volume due to artificial but permanent changes.

The opinion in the *Daniel Ball* case has been cited and interpreted many times and nowhere has it been given the meaning contended for by counsel for the Government. It was interpreted in the *Montello* 20 Wall 430. At page 435, 20 Wall, appears the following from the brief of the Attorney General:

> "Where the navigation is the principal one, and the artificial merely dependent and ancillary thereto, and the natural stream is in fact navigable within the ordinary acceptation of the word, then the river forms a part of the navigable waters of the United States, if, by means of artificial navigation, it is practically made so and interstate commerce is actually carried on."

It was, therefore, plainly urged by the Attorney General in that case that the test of navigability was the natural capacity of the stream independent of artificial improvements. The court decided in favor of that contention, saying:

> "The vital and essential point is whether the natural navigation of the river is such that it affords a channel for useful commerce. If this be so, the river is navigable in fact, although its navigation may be encompassed with difficulties by reason of natural barriers such as rapids and sandbars."

This language leaves no room for argument that the court had in mind:

> "the usual or periodic stage of the water as distinguished from unusual floods and not as distinguished from a volume due to artificial but permanent changes."

The court was specifically dealing with the "natural navigation of the river" unaided by artificial improvements, and its conclusion was as follows:

> "from what has been said, it follows that Fox River is within the rule prescribed by this court in order to determine whether a river is a navigable water of the United States. It has always been navigable in fact, and not only capable of use, but actually used as a highway for commerce, in the only mode in which commerce could be conducted, *before the navigation of the river was improved.*"

In *Thunder Bay River Booming Co. vs. Speechly,* 31 Mich., 335, Judge Cooley said:

> "The public right is measured by the capacity of the stream for valuable public use in its natural condition."

While it is clear from the evidence that the Desplaines has not at any time been, and is not now, navigable, there is, in fact, no conflict among the authorities on the proposition under discussion; and if there were no authorities and the court were to be guided only by reason, it could, we submit, come to no different conclusion. In Illinois the title to the beds of rivers, whether navigable or non-navigable, is in the riparian owner. That title is derived from the State. Whatever its nature was when thus originally acquired, such it remains until, by the exercise of the right of eminent domain and, the payment of compensation, it is taken away entirely, or in some manner qualified or burdened. He who acquires the bed of a navigable stream, from the beginning assumes the burden of an easement of navigation for the benefit of the general public; but he who purchases land which includes a stream not navigable, acquires the same unburdened title to that portion which is covered by water as to the remainder. To enter upon that portion of it is as much a trespass as to enter on any other portion. It would be difficult to devise any theory upon which the State, or the United States, could, by the addition of waters, or by dredging a channel, create a highway across lands so situated, any more than they could project a street through a city block, without compensation to the owner and without due process of law. In either case the act would be confiscation. The right of a farmer to use, and enjoy, that portion of his lands through which an unnavigable stream passes is, so far as the public is concerned, as well defined, and as unqualified, as his right to any other portion of his farm.

It is well known that, in the early settlement of the country, the selection of sites for homes and farms, as well as for saw and grist mills, was largely dependent

upon the conditions as to flowing water. Indeed, the trustees of the Illinois and Michigan Canal, in early publications, referred to the water powers upon the Desplaines River as an inducement to persons to purchase these very lands. The earliest settlers availed themselves of these water power privileges. In 1833, Beard built a dam substantially at the site of appellant's dam. At that time there were dams entirely across both channels of the river at Treat's Island, on part of what is now appellant's water power property. In 1833 the McKee dam was built at Joliet. Norman's dam was situated in an old numbered section between Lockport and Joliet. The Haven dam below Joliet was erected in the year 1839. The right to maintain it was recognized by the Supreme Court of Illinois in three different suits, and the Sanitary District was ultimately compelled to pay for it the sum of $70,000. In 1841 the Circuit Court of Will County decreed that the trustees of the Illinois and Michigan Canal should pay $16,700 for the McKee dam, and in 1845 they did so, and took a conveyance of the dam, and the right to the dam site. These early riparian owners found an unnavigable river. They erected dams across it at various places, and their right to do so was respected, and protected, by the courts. That such rights are property, and of large value, need not be argued.

Inasmuch, as, in the case at bar, counsel in their brief have distinctly asserted a right in the public to deprive the appellant of its property because of artificial additions to the volume of the stream, the language of Judge Cooley, quoted in our original brief at page 106, is particularly pertinent.

In *Pearson vs. Rolfe,* 76 Maine, 380, the court said (p. 385):

> "It is the natural condition of a stream which determines its character for public use. And it must be its navigable properties in a natural condition, unaided by artificial means or devices."

Substantially this language has been used in a number of cases, some of which the court quotes in the above decision, and so far as we are able to find there is not a single authority to the contrary. Of what weight, then is the mass of reports of engineers collected in this record, as to schemes, or plans, for *creating* a navigable channel in the Desplaines River? To the Government's case they give no aid. To appellant's they afford most substantial support, because they recognize the fact that the stream, in its natural condition was not navigable.

In *East Hoquiam Boom and Logging Company* vs. *Neeson*, 54 Pacific 1001; 20 Wash., 142 (1898), it is said:

> "It is well settled that a stream which can only be made navigable or floatable by artificial means is not a public highway."—Citing Daniel Ball, 10 Wallace, 557, and other cases.

In the Government's brief it is said that:

> "Even if the stretch of the Desplaines in question had been substantially unnavigable 'without the artificial aid of canals' the fact that it served as a connection between the obviously navigable water of Lake Michigan and the Illinois River would in itself have rendered a navigable water of the United States and within the protection of Congress."

And they cite *U. S. vs. Chandler Dunbar Co.*, 239 U. S. 25356.

The Soo St. Marie, which is referred to in that case is a great waterway obstructed by a short rapids. It connected Lake Superior with the lower lakes. The Des-

plaines in a state of nature did not connect Lake Michigan and the Illinois. When a connection was made between that lake and the Illinois, it was by digging a canal from the Chicago River to Ottawa.

We refer the court again upon this point to *Veasey vs. Moore,* 14 Howard 568, cited in our original brief page 73.

The case of *State vs. Carpenter,* 68 Wis., 165, 60 Amer. Reports, 848, is very persuasive. That was an action brought by the State to prevent the placing of an obstruction in Rock River at Janesville. In Wisconsin the provision of the Act of 1787 concerning navigable waters and carrying places was specifically adopted as Section 1, Art. 9, of the Constitution. For that reason alone it is operative in that State. *State of Wisconsin vs. Adams,* 15 L. R. A., 561. Notwithstanding that fact, however, it was held in the *Carpenter* case that even though Rock River was a navigable stream under the Ordinance of 1787, and the Constitution of the State, and putting an obstruction in it was, therefore, technically a public wrong, yet inasmuch as it had not been used for navigation for many years and was obstructed by dams and bridges, a court of equity would not enjoin a further obstruction at the suit of the Attorney General. The court said:

> "There was a time, in the early settlement of the country bordering on this river, when it was practically and in fact navigable, and actually used to a limited extent for the floating of logs, and perhaps for small boats and barges. But since that region has been denuded of its forest, and other and better means for transportation have come into use, such practical use of the river has been entirely abandoned, and its waters have been exclusively used by riparian proprietors and for hydraulic purposes, and it has been spanned by highway and railway bridges and

mill-dams in near proximity with each other throughout its entire course. We shall see that these considerations and conditions cannot be ignored in a case like the present one, where a court of equity is asked by the Attorney-General, on behalf of the public, for an injunction to restrain a single encroachment upon the waters of this river, which at most will not much increase the obstructions which have for a long time existed to its technical and legal navigability.

"The nuisance does not consist in obstructing the river, but in obstructing the use of the river as a navigable stream by the public. The defendant may have no right whatever to erect a building in it that may obstruct the navigation of Rock River, and by doing so he may be technically guilty of a public wrong. But that is not the question. Where is the immediate hurt, injury, inconvenience or peril of the public in this threatened construction, that a court of equity should be called upon to exercise this extraordinary and questionable jurisdiction to enjoin it? If completed, as threatened, the public may not for many years, and probably never, suffer any injury or inconvenience from it. The river has not been navigable in fact, or navigated or used or needed for such purpose, for many years, and probably never will be again. The wrong and injury to the public, if any, are merely technical and nominal. Courts of chancery should not be called upon to exercise this high jurisdiction in a case where it is needless and useless and a mere idle ceremony. *Cui bono? In order to have the character of navigability, this river should be navigable in fact, or navigable to some purpose useful to trade or agriculture, and must be generally or commonly useful for such purpose, if courts are called upon to interfere to protect its navigability.*"

See also, *Attorney General vs. Delaware*, etc., *Rd. Co.*, 27 N. J. Eq., 631.

VIII

AS TO THE ALLEGATIONS THAT THE SANITARY DISTRICT CANAL IS NAVIGATED.

Counsel for the Government ask the Court to take judicial notice that the Sanitary District Canal has been actually navigated for 19 years and that for years a passenger packet has navigated between Joliet and Chicago. The Court is asked to take judicial notice of what is not a fact. There has never been a passenger packet navigated between Joliet and Chicago. At the Chicago terminus of the canal there is an 8-track lift bridge. The motor power to lift it has never been installed. It was so built that such installation could be made whenever the Government took over the channel for purpose of navigation. Small boats have infrequently passed under it. This is out of the record, but so is the statement of counsel as to the passenger packets navigating between Joliet and Chicago.

IX

IT IS NOT THE FACT THAT GOVERNMENT REPORTS HAVE EVER RECOGNIZED THAT THE DESPLAINES IS NAVIGABLE. THEY HAVE SHOWN THE CONTRARY.

Counsel make references to certain reports of the Government engineers for the purpose, as they say, of showing that the actual navigation, and the navigability of the Desplaines River was recognized by the Government in an official report as early as 1819, and that the general government has had in contemplation the improvement of the river for purposes of navigation since 1867. The report of 1819, above referred to, is that of Graham and Phillipps, in which it was said:

"The Plein during half the year does not contain water enough to float a boat, and so could not become useful as a navigable highway." (Abst., p. 115.)

It was this report that pointed out that at one season of the year the portage was 50 miles, which eliminated the Desplaines altogether, and that there was a well beaten wagon road, and that boats and their loads were hauled by oxen and vehicles kept for that purpose by the French settlers at Chicago. (Abst., 116.) The report of 1867, to which counsel refer, is that of General Wilson, which stated that the Desplaines, except in floods, was very shallow, being often reduced in dry seasons to a mere brook, discharging less than one thousand cubic feet of water per minute. (Abst., 1072, 2843.) It must be admitted, therefore, that these references do not show "that the actual navigation and navigability of the Desplaines River was recognized by the Government in an official report as early as 1819," nor that the Government had ever decided to improve the river for purposes of navigation.

Counsel refer to other reports, all of which have to do with canalizing the river by means of locks and dams. For example, that of Major Benyaurd's, who says:

"That the only feasible plan to render the stream navigable is to slack-water the whole distance."

Counsel omit any reference to the Barlow report of 1900, which says:

"That the upper Illinois and Desplaines are at present non-navigable." (Abst., 2855.)

It is not true that the general government has had in contemplation the improvement of the river for purposes

of navigation since 1867. It has made surveys of routes, whether by canal or by the river, for connecting Lake Michigan with the head of navigation on the Illinois, which is at Ottawa; but at no time has it appropriated a dollar for the improvement of the Desplaines River.

X

As to the claim that the reason why there was no navigation was the existence of dams

We pointed out in our original brief that there had been no evidence of any navigation of the river "within the memory of living man." The memory of some of these witnesses went back to the early thirties and we urged that the surest test of the navigability of a river, located in a new country, where there were no railroads, was the use made of it. Counsel seek to avoid the inevitable conclusions to be deduced from the fact that no early settlers used the river, by stating that the erection of dams prevented practical navigation subsequent to 1833. The obvious answer is: that if under the conditions of early settlement, and lack of other means of travel, this stream had been navigable, no dams would have been permitted which prevented its use for the purpose of navigation.

XI

The "Appendix" to Government's brief

There is attached to the Government's brief an appendix of 30 pages, being copies of articles which have to do with waterway improvement, and changes which have come over river commerce since paddle-wheel steamers gave way to gasoline propelled boats. It is significant that though for some years there has been no dam in that part of the Desplaines River now under consideration,

no attempt has been made to use any such boats, not even gasoline launches, on that river or the upper Illinois. We submit that if those rivers had been capable of such use, the Government would have demonstrated that fact as the best practical evidence of their navigability. Such a demonstration would have been of much greater value than the theoretical computations of Cooley and other expert witnesses.

XII

Conclusion

We submit that the proper application of the Act of 1899, intended for the practical purpose of regulating commerce as it exists today, and having validity only because of the Commerce clause of the Constitution, cannot be determined by resort to legislation which is no longer in force, which was intended to control a situation which has not existed for a hundred years, and which would, as interpreted by the trial court, declare that a stream which was used to any extent in those pre-settlement days, is a navigable water of the United States, without reference to whether any commerce has ever passed over it since the earliest settlement, or ever can pass over it.

Respectfully submitted,

Frank H. Scott,
Attorney for Appellant.

ECONOMY LIGHT & POWER COMPANY *v.* UNITED STATES.

APPEAL FROM THE CIRCUIT COURT OF APPEALS FOR THE SEVENTH CIRCUIT.

No. 104. Argued December 17, 1920.—Decided April 11, 1921.

1. Artificial obstructions subject to abatement by public authority do not render non-navigable in law a stream which in its natural state would be navigable in fact. P. 118.
2. The authority of Congress to prohibit added obstructions to a navigable stream is not lost by omission to take action in previous cases. P. 118.
3. The Desplaines River in Illinois which was used from a very early day to about the year 1825 as a link in a well-known route between Lake Michigan and the Mississippi, in the transportation of furs and supplies by canoes and other light-draft boats, but has not since

been used for transportation and is not thus useful under existing conditions, *held* a navigable water of the United States and within the act of Congress forbidding unauthorized obstructions. Act of March 3, 1899, c. 425, § 9, 30 Stat. 1151. Pp. 117, 123.

4. The public interest in navigable streams of this character in Illinois and neighboring States, and the federal authority over such as are capable of serving interstate commerce, arises not from custom or implication, but from the declaration of the 4th Article of the compact in the Ordinance of July 13, 1787, for the government of the Northwest Territory, that the navigable waters leading into the Mississippi and St. Lawrence, and the carrying places between the same, shall be common highways and forever free, etc.,—a principle which was reiterated in later acts of Congress and accepted by Illinois in her constitution at the time of her admission as a State. P. 118.
5. In so far as the Ordinance of 1787 thus established public rights of highway in navigable waters capable of bearing commerce from State to State, it was no more subject to repeal by a State than any other regulation of interstate commerce enacted by Congress. P. 120.
6. The power of the States to regulate such navigable waters is plenary within their borders until Congress intervenes, but Congress has the power to assume entire control whenever it chooses, unhampered by previous acts of the States, and this supreme authority applies to States formed out of the Northwest Territory as well as to others, and may be exercised through general as well as special laws. P. 121.
7. A river may be navigable in law though it contain natural obstructions and though it be not open to navigation at all seasons or at all stages of water. P. 121.
8. A decision of a state Supreme Court holding a river not navigable in its natural condition does not bind the United States if it was not a party to the suit. P. 123.
9. A river having actual navigable capacity in its natural state and capable of carrying commerce among the States is within the power of Congress to preserve for purposes of future transportation, even though it be not at present used for such commerce and be incapable of such use according to present methods, either by reason of changed conditions or because of artificial obstructions. P. 123.
10. The provisions of § 9 of the Act of March 3, 1899, *supra*, applicable in terms to "*any* navigable river or other navigable water of the United States," cannot be limited to such waters as were at the date of the act, or as now are, actually open to use. P. 123.
11. Where there was no application under the statute, but the party

desiring to build a dam merely submitted its plans to the Secretary of War at an informal hearing and assured him that the stream was not navigable, *held* that his refusal to act, upon the ground that that condition left the stream without his jurisdiction, imported neither an approval of the project nor an inquiry concerning navigability. P. 124.

256 Fed. Rep. 792, affirmed.

THE case is stated in the opinion.

Mr. Frank H. Scott for appellant.

Mr. Clarence N. Goodwin, Special Assistant to the Attorney General, with whom *The Solicitor General* was on the brief, for the United States.

MR. JUSTICE PITNEY delivered the opinion of the court.

This was a suit brought by the United States against appellant in the District Court for the Northern District of Illinois, Eastern Division, for an injunction to restrain defendant from constructing a dam in the Desplaines River at a point in Grundy County, Illinois, without the consent of Congress or authority of the legislature of the State, and without approval of the location and plans by the Chief of Engineers and the Secretary of War of the United States. Relief was prayed upon two grounds: (1) that the river bed where the dam was being constructed was the property of the United States; (2) that the Desplaines River was a navigable waterway of the United States, and the proposed construction of a dam therein was in violation of the Act of Congress of March 3, 1899, c. 425, § 9, 30 Stat. 1121, 1151. The first ground was overruled by the District Court and disregarded by the Circuit Court of Appeals. We need not consider it further. The second ground was sustained by the District Court, and its final decree granting an injunction was

affirmed by the Circuit Court of Appeals, 256 Fed. Rep. 792. The present appeal followed.

Section 7 of Act of September 19, 1890, c. 907, 26 Stat. 426, 454, makes it unlawful to build any dam or other structure in any navigable river or other waters of the United States, so as to obstruct or impair navigation, without permission of the Secretary of War. Section 9 of the Act of March 3, 1899 (30 Stat. 1151) declares: "That it shall not be lawful to construct or commence the construction of any bridge, dam, dike, or causeway over or in any . . . navigable river, or other navigable water of the United States until the consent of Congress to the building of such structures shall have been obtained and until the plans for the same shall have been submitted to and approved by the Chief of Engineers and by the Secretary of War: *Provided*, That such structures may be built under authority of the legislature of a State across rivers and other waterways the navigable portions of which lie wholly within the limits of a single State, provided the location and plans thereof are submitted to and approved by the Chief of Engineers and by the Secretary of War before construction is commenced. . . ."

There is no contention that the consent of Congress for the building of the proposed dam has been obtained, that its construction has been authorized by the legislature of the State of Illinois, or that the location and plans have been submitted to and approved by the Chief of Engineers and the Secretary of War. The substantial defense is that the Desplaines River, at the site of the proposed dam, which is below the City of Joliet and just above the point where the Desplaines joins the Kankakee to form the Illinois River, is not navigable in fact and not within the description "navigable river, or other navigable water of the United States," as employed in the Act of 1899.

The District Court found that there was no evidence of actual navigation within the memory of living men, and that there would be no present interference with navigation by the building of the proposed dam. The Circuit Court of Appeals did not disturb this finding. 256 Fed. Rep. 792, 798. But both courts found that in its natural state the river was navigable in fact, and that it was actually used for the purposes of navigation and trading in the customary way, and with the kinds of craft ordinarily in use for that purpose on rivers of the United States, from early fur-trading days (about 1675) down to the end of the first quarter of the nineteenth century. Details are given in the opinion of the Circuit Court of Appeals, and need not be repeated. Suffice it to say that there was a well-known route by water, called the Chicago-Desplaines-Illinois route, running up the Chicago River from its mouth on Lake Michigan to a point on the west fork of the south branch; thence westerly by water or portage, according to the season, to Mud Lake, about 2 miles; thence to the Desplaines near Riverside, 2 miles; thence down the Desplaines to the confluence of that river with the Kankakee, where they form the Illinois River; thence down the Illinois to its junction with the Mississippi. During the period mentioned the fur trade was a leading branch of commerce in the western territory, and it was regularly conducted upon the Desplaines River. Supplies in large quantity and variety, needed by the early settlers, also were transported over this route between Chicago and St. Louis and other points. Canoes and other boats of various kinds were employed, having light draft but capable of carrying several tons each, and manned by crews of six or eight men. The route was navigated by the American Fur Company regularly during a period of years down to about 1825, after which it was disused because the trade had receded to interior portions of Illinois that could be reached

more conveniently with horses. Later, changes occurred in the river, due to the drainage of a swamp in the region of the portage, the clearing away of forests affecting the rainfall and the distribution of the run-off, and thus shortening the duration of the higher stages of water; the construction (under state authority) of the Illinois and Michigan Canal in 1848 and its deepening in 1866 to 1871, which diverted a part of the hill drainage towards the Chicago River; and the construction of the Sanitary and Ship Canal in 1892 to 1894.

But, in spite of these changes, the Circuit Court of Appeals finds (256 Fed. Rep. 804) that the Desplaines River is a continuous stretch of water from Riverside (at the Chicago divide) to its mouth; and although there is a rapid, and in places shallow water, with boulders and obstructions, yet these things do not affect its navigable capacity; that the same is true of the upper part of the Illinois River above the head of steamboat navigation; and that both streams are navigable and are within the Act of 1899.

Since about the year 1835 a number of dams have been built in the Desplaines, without authority from the United States, and one or more of them still remain; besides, a considerable number of bridges of various kinds span the river. The fact, however, that artificial obstructions exist capable of being abated by due exercise of the public authority, does not prevent the stream from being regarded as navigable in law, if, supposing them to be abated, it be navigable in fact in its natural state. The authority of Congress to prohibit added obstructions is not taken away by the fact that it has omitted to take action in previous cases.

The public interest in navigable streams of this character in Illinois and neighboring States, and the federal authority over such as are capable of serving commerce among the States, does not arise from custom or implica-

tion, but has a very definite origin. By Article 4 of the compact in the Ordinance of July 13, 1787, for the government of the territory northwest of the river Ohio, it was declared: "The navigable waters leading into the Mississippi and Saint Lawrence, and the carrying places between the same, shall be common highways, and forever free, as well to the inhabitants of the said territory, as to the citizens of the United States, and those of any other States that may be admitted into the confederacy, without any tax, impost, or duty therefor." 1 Stat. 51, 52, note; Rev. Stats. U. S., 1878 ed., pp. 13, 16. This was under the Confederation; but the first Congress under the new Constitution expressed a design to have it continue in full effect, in the Act of August 7, 1789, c. 8, 1 Stat. 50. A purpose to preserve the rights of public highway in the navigable rivers was again manifested in § 9 of Act of May 18, 1796, c. 29, 1 Stat. 464, 468. The Territory of Indiana (including what is now Illinois) was set apart and organized by Act of May 7, 1800, which in § 2 reiterated that purpose, (c. 41, 2 Stat. 58, 59); and in an act providing for the disposal of the public lands therein (Act of March 26, 1804, c. 35, § 6, 2 Stat. 277, 279–280), it was again declared "that all the navigable rivers, creeks and waters, within the Indiana territory, shall be deemed to be and remain public highways." Illinois was set apart and a separate territorial government established therein by Act of February 3, 1809, c. 13, 2 Stat. 514. By § 2, the government was to be "in all respects similar" to that provided by the Ordinance of 1787 and the Act of August 7, 1789, and the inhabitants were to enjoy all the rights, privileges, and conditions granted by the Ordinance. An Act to enable the people of Illinois to form a state government, approved April 18, 1818, c. 67, 3 Stat. 428, contained a proviso (§ 4, p. 430) that such government should not be repugnant to the Ordinance of 1787. The state constitution declared its purpose to

be consistent with the Ordinance, and the resolution of Congress declaring admission of the State into the Union (December 3, 1818, 3 Stat. 536) acknowledged that the constitution and state government were "in conformity to the principles of the articles of compact" in the Ordinance of 1787.

There can be no doubt that the waters of the Chicago-Desplaines-Illinois route "and the carrying places between the same" constituted one of the routes of commerce intended by the Ordinance, and the subsequent acts referred to, to be maintained as common highways. It did not make them navigable in law unless they were navigable in fact, but declared the public rights therein so far as they were navigable in fact; and it is curious and interesting that the importance of these inland waterways, and the inappropriateness of the tidal test in defining our navigable waters, was thus recognized by the Congress of the Confederation more than 80 years before this court decided *The Daniel Ball*, 10 Wall. 557, 563, and more than 60 years before *The Propeller Genesee Chief* v. *Fitzhugh*, 12 How. 443, 455.

To the extent that it pertained to internal affairs, the Ordinance of 1787—notwithstanding its contractual form—was no more than a regulation of territory belonging to the United States, and was superseded by the admission of the State of Illinois into the Union "on an equal footing with the original States in all respects whatever." *Permoli* v. *First Municipality*, 3 How. 589, 610; *Van Brocklin* v. *Tennessee*, 117 U. S. 151, 159; *Hawkins* v. *Bleakly*, 243 U. S. 210, 217. But, so far as it established public rights of highway in navigable waters capable of bearing commerce from State to State, it did not regulate internal affairs alone, and was no more capable of repeal by one of the States than any other regulation of interstate commerce enacted by the Congress; being analogous in this respect to legislation enacted under the exclusive power

of Congress to regulate commerce with the Indian tribes. *Pollard's Lessee* v. *Hagan*, 3 How. 212, 229–230; *Ex parte Webb*, 225 U. S. 663, 683, 690–691; *United States* v. *Sandoval*, 231 U. S. 28, 38.

Nothing inconsistent with this was decided in *Escanaba Co.* v. *Chicago*, 107 U. S. 678, 688–689; *Huse* v. *Glover*, 119 U. S. 543, 546; *Sands* v. *Manistee River Improvement Co.*, 123 U. S. 288, 295, 296; *Willamette Iron Bridge Co.* v. *Hatch*, 125 U. S. 1, 8–11. Those cases simply hold, in effect, that a State formed out of a part of the Northwest Territory has the same power to regulate navigable waters within its borders that is possessed by other States of the Union; that is to say, until Congress intervenes, the power of the State, locally exerted, is plenary; nevertheless, where the navigation serves commerce among the States or with foreign nations, Congress has the supreme power when it chooses to act, and is not prevented, by anything the States may have done, from assuming entire control in the matter. In short, that the rule laid down in *Willson* v. *Black-bird Creek Marsh Co.*, 2 Pet. 245, 252, and *Gilman* v. *Philadelphia*, 3 Wall. 713, 731, applies to States formed out of the Northwest Territory as well as to others. This is not questioned. But, as was recognized in the *Gilman Case* (p. 731), Congress may exercise its authority through general as well as through special laws, its power in either case being supreme. The Act of 1899 (30 Stat. 1151), upon which the present bill is founded, is a due assertion of the authority of Congress over all navigable waters within its jurisdiction; and it must be accorded due weight as such.

The Circuit Court of Appeals, in passing upon the question of navigability, correctly applied the test laid down by this court in *The Daniel Ball*, 10 Wall. 557, 563; and *The Montello*, 20 Wall. 430, 440–443; that is, the test whether the river, in its natural state, is used, or capable of being used as a highway for commerce, over which

trade and travel is or may be conducted in the customary modes of trade and travel on water. Navigability, in the sense of the law, is not destroyed because the watercourse is interrupted by occasional natural obstructions or portages; nor need the navigation be open at all seasons of the year, or at all stages of the water.

In *The Montello, supra*, the question was whether Fox River, in the State of Wisconsin, was a navigable water of the United States within the meaning of acts of Congress. Originally there were rapids and falls in the river, but these had been obviated by locks, canals, and dams, so as to furnish an uninterrupted water communication for steam vessels of a considerable capacity. It was argued (p. 440) that although since these improvements the river might be considered as a highway for commerce conducted in the ordinary modes, it was not so in its natural state, and therefore not navigable under the decision in *The Daniel Ball, supra*. The court, accepting navigability in the natural state of the river as the correct test, proceeded to show that, before the improvements resulting in an unbroken navigation, and when a few portages were necessary, a large and successful interstate commerce had been carried through the river by means of Durham boats; and, speaking by Mr. Justice Davis, proceeded to say (p. 441) that, even aside from the Ordinance of 1787, "the true test of the navigability of a stream does not depend on the mode by which commerce is, or may be, conducted, nor the difficulties attending navigation. If this were so, the public would be deprived of the use of many of the large rivers of the country over which rafts of lumber of great value are constantly taken to market. It would be a narrow rule to hold that in this country, unless a river was capable of being navigated by steam or sail vessels, it could not be treated as a public highway. The capability of use by the public for purposes of transportation and commerce affords the true criterion of the

navigability of a river, rather than the extent and manner of that use. If it be capable in its natural state of being used for purposes of commerce, no matter in what mode the commerce may be conducted, it is navigable in fact, and becomes in law a public river or highway." Proceeding to say (p. 442) that notwithstanding the fact that before the improvements there were obstructions to an unbroken navigation, which rendered the navigation difficult and prevented the adoption of modern agencies, commerce was successfully carried on, the court pointed out (p. 442) that the Ordinance of 1787 recognized "carrying-places" as a part of a navigable waterway.

Our attention is called to the fact that in *People* v. *Economy Power Co.*, 241 Illinois, 290, 320–338, the Supreme Court of Illinois held that the Desplaines in its natural condition is not a navigable stream; and it is intimated that we ought to follow that decision. A writ of error brought to review it was dismissed by us because no federal question was involved (234 U. S. 497, 510, 524). Of course, the decision does not render the matter *res judicata*, as the United States was not a party. The District Court in the present case treated it as not persuasive, because it appeared that evidence was wanting which is present here; and we cannot say that the court below erred in not following it.

We concur in the opinion of the Circuit Court of Appeals that a river having actual navigable capacity in its natural state and capable of carrying commerce among the States, is within the power of Congress to preserve for purposes of future transportation, even though it be not at present used for such commerce, and be incapable of such use according to present methods, either by reason of changed conditions or because of artificial obstructions. And we agree that the provisions of § 9 of the Act of 1899 (30 Stat. 1151) apply to such a stream. The act in terms applies to "*any* . . . navigable river, or other

navigable water of the United States"; and, without doing violence to its manifest purpose, we cannot limit its prohibition to such navigable waters as were, at the time of its passage, or now are, actually open for use. The Desplaines River, after being of practical service as a highway of commerce for a century and a half, fell into disuse, partly through changes in the course of trade or methods of navigation, or changes in its own condition, partly as the result of artificial obstructions. In consequence, it has been out of use for a hundred years; but a hundred years is a brief space in the life of a nation; improvements in the methods of water transportation or increased cost in other methods of transportation may restore the usefulness of this stream; since it is a natural interstate waterway, it is within the power of Congress to improve it at the public expense; and it is not difficult to believe that many other streams are in like condition and require only the exertion of federal control to make them again important avenues of commerce among the States. If they are to be abandoned, it is for Congress, not the courts, so to declare. The policy of Congress is clearly evidenced in the Act of 1899, and, in the present case at least, nothing remains but to give effect to it.

It is contended that, supposing the Desplaines is navigable, the purpose of the Act of 1899 was in effect accomplished because appellant or its predecessor, before proceeding with the enterprise, submitted the plans for the proposed dam to the War Department, and that Department "in substance gave its approval," although it did not formally approve the plans because it did not consider the Desplaines River a navigable water of the United States. It appears, however, that there was no application for an approval under the Act of 1899, and the Department was not called upon to exercise its jurisdiction under that act. There was an informal hearing before the Secretary, at which the representatives of

appellant, assuring him that the Desplaines was not a navigable stream either in law or in fact, and that the Department had no jurisdiction over it, asked not for a permit, but in effect for an assurance that no permit was necessary. The Secretary declined to act because, as the river was not navigable, he had no jurisdiction. We cannot regard this as equivalent to an approval, either in form or effect, or even as an official inquiry into the navigability of the river.

Decree affirmed.

MR. JUSTICE MCREYNOLDS took no part in the consideration or decision of this case.
